Communal Discourse and Consumer Identity

Two streams of discourse, on economic liberalisation and Hinduisation, came to prominence in close proximity in the mid-80s, reinforcing each other but also interrupting and clashing periodically. Underlying the adaptation and encroachment of communal discourse within commodity culture is the rise to prominence of mass-mediated images as a centralised locus of social and political discourse. With this development emerges a new era of symbolic politics. 1659

Creating Common Ground

Academic responses on the government's new economic programmes have been predictable: most, though not all, left intellectuals have vehemently argued against the current initiatives, while those closer to the government have argued that the superstructure of economic governance and policy had long become dysfunctional and had to be reoriented or changed altogether. And yet there is a need to create common ground so that the hypotheses and fears on both sides are posed against facts. 1669

Unregulated, Unhealthy

The quality of care in the private health care sector is not only deteriorating badly, there is hardly any regulatory or monitoring mechanism in place in most states in the country. 1680

Overdue Reforms

While the proposed legislation on electoral reforms leaves much to be desired, the occasion provides an opportunity for wide ranging debate on these long overdue changes in the electoral process. 1635

Unresolved Issues

If the dalit-intermediate class alliance forged by the SP-BSP combine is to have a future, three issues have to be defined: dalit relations with the intermediate caste, the impact of the alliance on the Muslims, and the nature of dalits' relations with those outside this electoral alliance. 1640

Regional Demands

Regional elites in Russia constitute important players in the struggle for power and control of the great redivision of state property since economic and political reform efforts have to be implemented in the regions. 1647

Misdiagnosis?

Private sector investment in agriculture has certainly declined in the last few years. But does the solution lie in a further opening up of the sector, as the World Bank's country paper recommends? 1620

To Share Evenly

The current scheme for disbursing the Bhopal settlement is individual-based and fails to respond to the severe medical and social consequences of the disaster. What is needed is a community-based scheme. 1643

Doomed

The German take-over of Rover, once the pride of British automobile industry, is an undeniable sign of the rapid erosion of the manufacturing base in John Major's England. 1645

Devitalisation

The emerging attempt to incorporate women's studies within family studies is to immediately circumscribe the wider and more critical agenda of the former. 1686

LETTERS TO EDITOR

Action against Bretton Woods

JULY 1994 marks the 50th anniversary of the founding of the Bretton Woods Institutions: the World Bank (WB), the International Monetary Fund (IMF) and the General Agreement on Tarrifs and Trade (GATT). During this month, organisations from around the world will be expressing their concern over the destructive economic, social and environmental impact of these institutions. In the name of development (i e, the extension of capitalist markets to all corners of the world and all areas of production), the WB and IMF in the 1970s lent money to third world countries; in the 1980s, the manipulation of interest rates led to growing indebtedness and increased control of third world domestic economies and policies. As an additional consequence, nature has been destroyed at an unprecedented rate. The displacement of rural populations and forced urban migration worldwide have contributed to the lack of secure housing and access to land.

Women for a Just and Healthy Planet (Toronto) has been active in drawing attention to this issue and will be focusing our efforts in July 1994 on the cancellation of the external debt of the third world. Therefore, considering that the third world debt has been paid many times over, and that the transfer of wealth from the south to the north is $ 50 billion annually, causing: the disintegration of third world economies and societies; the destruction of third world peoples, the degradation of local and global environments; dictatorship, militarism, and violence against women; forced migration producing millions of refugees, production of coca (cocaine) and opium (heroin) as cash crops for international trade; and a real risk that Canadians will continue to have to bail out Canadian commercial banks due to tax write-offs for uncollected debt. We request your assistance in mobilising support for actions demonstrating against the international financial institutions and commercial banks. July, 1994 is 'Freedom from the Debt Month', on that month in each country worldwide, people will mobilise to carry out activities according to their particular situations and contexts to inform the public about the debt and demand its cancellation. Activities could also include street demonstrations, strikes, conferences, a letter or postcard writing campaign, media work, lobbying politicians or publishing an edition of your newsletter devoted to this subject.

We are encouraging other groups who share our concerns to take action as part of this international movement. In support of third world countries, some very clear messages should be sent to the commercial banks. For instance, on July 14, in Canada we are organising to have people withdraw funds from the Royal Bank, Toronto Dominion Bank, Scotia Bank, Canadian Imperial Bank of Commerce and Bank of Montreal, which are involved in environmentally and socially destructive activities in regions where commercial banks are very active, such as Latin America, the Caribbean and the Philippines. People could be encouraged to cut up their bank cards and to turn to alternatives such as co-operatives and credit unions.

In carrying out these activities, we propose integration of the following: (1) Sensitising people to the effects of the external debt, stabilisation, structural adjustment programmes and free trade (as exemplified, for instance, by NAFTA) on the daily lives of people in the third world; (2) Incorporating the debt issue into all further work, workshops, conferences, forums, in order to put the reality of the debt back into public discussion and to avoid talking vaguely of an unnamed crisis, (3) Relying on international information media networks, who will use their position to point out the effects of the external debt, structural adjustment, free trade and the stabilisation policies implemented in various regions; and (4) In July 1994, the Bretton Woods Institutions will be 50 years old. We propose that the feminis movement, and the Habitat Internationa Coalition Women and Shelter Network, together with the International Debt Trea Movement, which was organised in Brazi in 1992 during the Earth Summit, present information about the consequences of the external debt and debt financing policies on women, children and the environment. Women for a Just and Healthy Planet (Toronto) is working on documenting information and publishing a pamphlet to provide to the general public.

Each action will be part of an organisation's or network's own campaign, with its own demands. What unites us is our common concern. NGOs in India, the US, Canada, Latin America, the Caribbean, parts of Europe and Africa have already begun organising for July. For information on the July 14 Action, please check E-m il PLANETWO@WEB.APC ORG. You may also wish to contact International Month of Action, c/o Eurodad, P O Box 100, London SE1 7RT, UK. When you take-action in July, make sure that everyone knows that you are one of hundreds of groups around the world who are concerned about the negative impact of the Worl Bank and the IMF.

WOMEN FOR A JUST AND HEALTHY PLANET

ECONOMIC
AND
POLITICAL

A Place for Women

TO suggest that Maharashtra's recently announced policy for women is a synthetic product of the government's effort to co-opt progressive agendas may appear to devalue the entire democratic process established in the course of evolving this document. Yet, the document not only makes a mockery of the concept of women's empowerment but seeks to channelise the aspirations of the mass of women and the demonstrated mobilising strength of the women's movement towards the long-term economic and political goals of the Indian state. It is a perceptive and well-designed effort to mend the widening rend in the social fabric by putting in place weak and temporary structures and systems in the absence of people-oriented economic transformation.

Ostensibly, the policy is in the tradition set in the 1970s when the new approach towards women as something other than recipients of welfare began to evolve. The goal is therefore to ensure the "improvement in the physical, mental and emotional quality of life of women" so that, through them "the society and the country can truly benefit from accelerated growth and development". The government also recognises the need to evaluate "the existing traditions and ideas on societal roles and relationships". In other words, the new woman of Maharashtra is to be accorded a role in the emerging 'growth and development' programme of the state.

The policy proposes to achieve these objectives by empowering women. Adequate and meaningful representation is to be given to women at all levels of decision-making: political, financial and administrative. This translates into making statutory provisions for reserving 10 per cent of all land and income at the gram panchayat level under the control of women's committees to be used for enhancing women's incomes. Similarly government allotments, primary membership of societies, etc. will be in the joint names of husband and wife. These are perhaps the most constructive aspects of the policy. If implemented, these measures will go a long way towards ensuring economic status to women, which will in turn provide a base for enhancing their social status. The problem is, however, to implement them in the face of the expected opposition, especially at the local level: a firmly entrenched male-dominated bureaucracy and the village leadership.

Not surprisingly, it is in the area of employment that the policy comes into its own. In the organised sector, it hopes to achieve its objective of empowering women by promoting women friendly practices such as introducing flexitime, short-term contracts, etc. setting up day care centres in government offices; and employing special squads to monitor the implementation of labour laws, etc. Great emphasis is given to promoting self-employment by providing training facilities, creating special agencies for access to markets and meeting credit requirements. But nowhere in all this is there even a passing concern for the rapid loss of jobs occurring because of the government's new economic and labour policies, a development which has demonstrably affected women most. In fact, there is a tacit understanding that this is an inevitable process which cannot be stalled, hence the development of 'alternative' employment fields. The creation of such employment is certainly to be valued, but not in the context of growing large-scale unemployment in the mainstream. If the state is sincerely concerned with women's empowerment then it is these areas which need to be tackled.

A further blind spot is the policy's note on health. There seems to be an utter lack of comprehension of the enormous morbidity burden women bear and of the tremendous and increasing difficulties they face in accessing efficient, effective and free health services. The public health sector especially in Maharashtra has already been subject to severe distortions because of the withdrawal of state investment and in a resource constrained environment, women's health needs suffer most.

The policy delineates a scheme proposing monetary compensation for women who delay child-bearing. This is indeed ironic. There are any number of studies to show that a family's decision to have a child is not taken lightly or that it may be reversed in return for monetary compensation. Moreover, the women's movement and health groups have repeatedly stressed the non-availability of safe and effective contraceptives as a factor contributing to large families. Clearly the small family norm is very much on the agenda of the state regardless of women's priorities.

Another aspect of empowerment is spelt out in the policy's intentions on improving the social status of women. "So that every woman can live without fear of physical or emotional violence" the state will take steps to reorient and retrain its police force, to induct more women in the police force and identify areas in metropolitan cities where atrocities are high and set up women-headed police stations there, and so on. Undoubtedly there is a need for efficient and responsive law enforcement mechanisms. However, violence in civil society, of man on woman, woman on woman, woman on child, is as much rooted in a patriarchal, hierarchical society as it is a consequence of increasing social stress generated by economic insecurity, whether it be fuelled by consumerist notions of success or because of the lack of the wherewithal for food, clothing and shelter. Moreover, the state's strong arm, no matter how well 'gender-sensitised', is unlikely to be pro-people, and therefore pro-women.

There is much to be said about the political acumen of the state's chief minister that the process set in motion for evolving the policy ensured the involvement of women's groups and organisations. And this was not merely a pre-election gimmick. There is much more at stake here. Maharashtra's acknowledgedly vocal women's and other pro-people's movements have to be brought into the mainstream of state policies, as partners, however reluctant, and not opponents. Towards this end the new woman has to be contoured, and recognised and accorded a role.

INVESTMENT IN AGRICULTURE

Creating Illusions

THE deceleration in growth of private investment in agriculture has been singled out by the World Bank for detailed analysis in its latest country paper. And not unexpectedly it tries to fit its diagnosis to preconceived prescriptions.

From an average annual growth of about 2.8 per cent per annum during the 1970s, the gross capital formation in agriculture in real terms by private households grew at the rate of 1.9 per cent during the 1980s. A further decline in private investment in the sector was evident in the early years of the 1990s. The total gross capital formation in agriculture at 1980-81 prices, which had experienced an absolute fall from Rs 4,636 crore in 1980-81 to Rs 4,014 crore in 1985-86, showed a slight recovery in the second half of the 1980s but the figure at Rs 4,642 crore in 1990-91 was the same as a decade ago. In the subsequent two years the decline continued to Rs 4,581 crore in 1991-92 and Rs 4,567 crore in 1992-93 Considering the fact that overall domestic investment was sluggish during 1993-94, the investment in agriculture was unlikely to have been larger than in the previous year. Besides, during 1992-93 and 1993-94 a relatively larger proportion of the gross capital formation has been in the form of build-up of additional stocks of foodgrains. Therefore, the size of gross fixed capital formation in real terms would have dipped to a much lower level than what it was in the early 1980s.

The erosion in the investment base of agriculture is brought out more pointedly when we relate agricultural capital formation to the total domestic capital formation or to the sector's own gross domestic product (GDP). As percentage of the economy's total capital formation, agricultural investment fell from 15.0 per cent in 1980-81 to 12.2 per cent in 1985-86, to 8.3 per cent in 1990-91 and finally to 7.9 per cent in 1992-93. Alternatively, as a proportion of GDP originating in agriculture, such investment steadily declined during the same years from 10.9 per cent to 8.7 per cent, 7.5 per cent, and 7.3 per cent, respectively.

Separate information on public and private investment in agriculture is not available for the recent period. Available information for the decade 1980-81 to 1990-91 suggests that public sector investment experienced the more conspicuous decline in real terms, that is, from Rs 1,796 crore in 1980-81 to Rs 1,221 crore in 1990-91. Private investment grew from Rs 2,840 crore to Rs 3,421 crore during the decade, thus showing, as the World Bank has revealed, an annual growth of 1.9 per cent. Certainly, this represents a deceleration in growth as compared with the growth in the previous decade, or in a proportion of aggregate private investments and sectoral GDP, there occurred a decline.

The greatest hindrance to stimulating private investment in agriculture, it has been recognised, lies in the persistent decline in public investment. Even while recognising this fact, the World Bank's document misplacedly emphasises tangential issues as hindering private investment. According to the World Bank the three other constraints hindering private investment are: implicit taxation of agriculture through a number of 'crude' policy instruments such as external trade restrictions and domestic price interventions; the current policy regimes with sweeping powers to control and regulate the production, supply, distributions and prices of essential commodities under the Essential Commodities Act; and the continued dependence of private investment in agro-processing industries on government licences and small-scale reservation policies "which restrict the setting up of large plants for rice and pulse milling, processing of wheat products like bread, biscuits, pastry, confectionery, ice cream, pickles, poultry feed and some oilseeds". In other words the Bank contends that corporate and multinational investment be permitted in the agricultural sector as well as in agro-processing industries.

Interestingly, the World Bank's own study shows that public investment in agriculture accounted for 90 per cent of the observed short-term aggregate output growth during the 1970s. Research conducted on the basis of data over the 1960s and 1970s has suggested that public investment in rural physical infrastructure (roads, electrification, canal irrigation, telecommunications), rural services (markets, agricultural research, and extension) and human resource development have stimulated private investment in agriculture and financial intermediation in rural areas and thus, on total capital accumulation in the sector. Ignoring such strong evidence the World Bank study dilates a great deal on marginal issues and suggests, by implication, corporalisation of agriculture and of economic activities around it.

Further, a significant rise in private investment in agriculture occurred during the 1960s and 1970s—precisely when the restrictive policy regime, castigated by the World Bank now, was much more rigorous than now. Secondly, the 1980s have seen significant relaxation of the various regulatory provisions. In fact, the Essential Commodities Act, 1955 is known to have been observed more in breach since the beginning of the 1980s. Thirdly, various implicit and explicit subsidies for food distributions, fertilisers, power consumption by farmers and irrigation which are said to have crowded out more productive forms of spending on agriculture, are a logical consequence essentially of the fact that the effective purchasing power of the mass of Indian population is truly weak. Within agriculture in general and in foodgrains production in particular also there would have been further deterioration in the structure of output against foodgrains, and within foodgrains, against pulses and such other protein-rich items. Finally, an important factor that the World Bank study seems to have consciously left out, because it does not fit into its market-dependent philosophy, relates to institutional factors like land reforms, the inadequacy of which has contributed a great deal to the lack of impetus to private household investment in agriculture.

Without the bulky and comprehensive infrastructural public investment in the rural sector the complementary private investment cannot take place in sufficient amount. And the World Bank's hope that the gap in investment in the sector because of the alarming decline in public inputs can be filled by the private sector if regulatory constraints are removed is illusory.

JANATA DAL

Splintered

IN September 1993 when some splinter groups of the Janata Dal had decided to merge, it was speculated, given the history of the Dal and of its predecessor the Janata Party, that the Dal may split again. That split came when Ajit Singh, leader of one of the factions, defected to join the Congress (I). However, the defection of Ajit Singh only nominally marked a split, for the splinter groups had never formally merged. Therefore the recent split in which George Fernandes and 13 other party MPs have formed a separate group, only continues the process begun by Chandrashekhar in 1990 who separated to form the Samajwadi Janata Party.

These splits in the JD parliamentary party have had their repercussions in the states too, particularly those where the party had a substantial presence. Currently, the most damaging effect has manifested itself in UP where out of the 27 MLAs of the party after the 1993 assembly elections, 10 dissociated themselves in March 1994 to form the Samta Dal only to merge later with the Samajwadi Party. Of the remaining 17, seven joined the SP a couple of weeks ago. Four more MLAs have now become part of the Congress. Of the six JD MLAs now left in the party, at last four have already negotiated with the SP and may cross over to it any day. Although none of the party legislators in Bihar has defected to the new group so far, the position of the chief minister Laloo Prasad Yadav, who stays with the original group, is already shaky. Here, the attack is led by the kurmi MP Nitish Kumar who seems to have set his eyes on the post of the chief minister. It is also from Bihar that 10 of the 14 breakaway

MPs, including George Fernandes, represented the party. In Orissa, chief minister Biju Patnaik, who has always defied the central leadership of the party, is holding consulations with the SJP leader Chandrashekhar and intends to revive the old Janata Party.

The immediate factor that has led to the latest round of splits was the extremely poor performance of the party in the last assembly elections, to be found in its most concrete form in UP. It was the hope of winning in these elections that had revived the merger talks in the different Janata Dal groups on the eve of the elections. Once that hope was belied, the merger was not formalised and the groups retained their independent identities, blaming one another for the poor showing in the elections. It was only expected then that some of the party members would walk over to other parties, especially the Samajwadi Party of Mulayam Singh Yadav which, in alliance with the BSP, had formed the new government in UP.

Except in states like Bihar however, where the crisis in the Dal is rooted mainly in the ambitions of some local party leaders—such as Nitish Kumar who has been mobilising the kurmis to carve a niche for himself in state politics, and Laloo Prasad Yadav who has oriented his politics to preserve his standing among yadavs—the major reason for the intermittent splits in the party is the expropriation of its ideological plank by other political groups. This phenomenon has once again been most evident in UP where the SP and BSP, among themselves, split the votes of the dalits and OBCs in the 1993 assembly elections. With this base gone, socialistically-oriented leaders like Fernandes, who have no mass base of their own, were left with no *raison d'etre* to stay with the likes of Ram Vilas Paswan and Sharad Yadav, the self-professed leaders, respectively, of dalits and OBCs.

In his pronouncements so far, however, Fernandes has not made clear how his group's walking out of the already truncated Janata Dal would help realise the cause, if any, that the group champions, or how it would enable the leaders of the group to acquire a mass base they have always lacked. Perhaps the best strategy for the group would be to merge with a party better placed than itself to achieve its objectives. That would at least save it the embarrassment of a split within its own ranks at a later date!

INDIA DEVELOPMENT FORUM

Setting the Trap

THE meeting of the Aid-India consortium (rechristened the India Development Forum (IDF) this year) currently underway represents the culmination of the steady efforts of the past three decades by the west-dominated multilateral agencies to dismantle the Indian planning system. Earlier attempts to do so, around the 1966 devaluation and the external fund facility (EFF) of the International Monetary Fund in 1982; and in the mid-1980s during the early part of the Rajiv Gandhi era got aborted due to the domestic compulsions of the ruling politicians which in turn arose from the leverage that the forces representing labour and other vulnerable sections possessed then. The situation is quite different now.

The three factors that stand out in the pre-meeting statements and the deliberations during the meeting are: first, India's inability to absorb larger foreign aid due to centralised economic governance and insufficiency of domestic savings required for counterpart or supplementary funds; second, the increasing tendency of the industrialised nations to cut-back on aid; and finally, multilateral agencies' insistence on deeper structural adjustment programmes and their emphasis on promoting the flow of foreign direct investment and other private capital.

During the 1993 meeting, the aid-India consortium members had sought appropriate action on the estimated $ 19 billion of unutilised multilateral and bilateral aid in the pipeline between the central and state governments; in fact this total had risen to $ 32 billion. In response, the government had surrendered $ 2 billion of the unspent amount, and introduced a package of measures such as, permitting public sector undertakings and autonomous bodies to borrow, without the intermediation of the central government, on terms mutually agreed upon with the lending agencies, and disbursing to the state governments the aid money on the same terms as those obtained by the government of India. These no doubt positive measures could not resolve the basic problem of aid non-utilisation because public sector undertakings as well as the state governments had been squeezed of resources at the margin because of the structural adjustment programme.

The government of India has had to opt for a lower amount of aid commitment this year at $ 6 billion, as against $ 7.4 billion committed in 1993 and $ 7.2 billion in 1992. Most of the reduction is attributable to lower borrowings from the World Bank (from $ 3 billion to $ 2.2 billion) and the Asian Development Bank (from $ 1.17 billion to $ 708 million), with bilateral donors like Great Britain cutting aid by about $ 200 million. Japan, which remains the largest donor, is the only country which has hiked its aid from $ 1.11 billion to $ 1.2 billion. Of the $ 6 billion aid commitment this year, $ 2.3 billion has been by way of grants or interest-free loans against a little over $ 2.0 billion last year. There is no fast disbursing loan this year as it is no longer needed. The Indian officials have conceded that they would not like to contract for more commercial loans than can be absorbed and that they were looking for quality disbursements in the aid pipeline, i e, higher amounts of concessional aid and faster utilisation. Many important donor country representatives at the meeting were however, peeved at this characterisation of 'quality' disbursements which implied that they had not been giving quality aid in the past. A major change this year is that the IDA loan to the tune of over $ 3.5 billion is to be disbursed over three years for social sector development, that is, primary education, family planning, nutrition, endemic disease control and rural works programme.

The World Bank's argument that the large foreign exchange reserves (of over $ 15 billion) have brought about a paradigm shift insofar as the size of aid is concerned is obviously an attempt to force India to change track. While fast-disbursing loans may not be required, development finance is acutely needed, especially because the Indian domestic saving ratios are stagnating. Better aid utilisation requires growing rates of domestic saving. But the ratio of saving to GDP, which stagnated for over a decade, has received a further setback due to conspicuous consumption including gold and silver purchases encouraged under the new economic policy.

The new nomenclature of India Development Forum implies that India would now be obliged to opt for private capital flows essentially in the form of portfolio and foreign direct investments. Towards this end, apart from the aid negotiation meeting, the World Bank has organised direct interaction between a group of top Indian industrialists and over 100 western investors including multinational manufacturers and financiers consisting of bankers, merchant bankers and financial institutions. This interaction is sure to impose tremendous pressure on the Indian government to hasten the process of reforms. Already India has been made to commit itself to increasing power tariffs and coal prices. Secondly, the World Bank official associated with the meeting said that there had been a change in their approach to non-concessional aid, that they would "stand ready to support when institutional and policy conditions are met"; hence, he said, there would be a good deal of volatility in the World Bank lending to India. World Bank and IMF representatives and western donors have also emphasised that the liberalisation of the investment regime would not be translated into a rapid increase in private investment unless it was followed by reform of the policy framework at the macro and sectoral levels, restructuring and privatisation (whenever possible) of public enterprises, conversion of the BIFR into an effective mechanism to close ailing enterprises, devising an effective labour policy, liberalisation of consumer goods imports and the completion of the tax reform.

A vociferous demand by the high-powered team of foreign investors at the meeting was that the share ownership restrictions be done away with on the ground that "many companies would like to see more than 51 per cent ownership; they would like 70 to 80 per cent". Suggesting that it was "time India stopped asking who shall we admit"; they sought removal of restrictions such as two GDR issues per industrial group. Thus, it is clear that the new nomenclature is a trap: unless the Indian government gives in on these sensitive issues, multilateral aid flow will slow down and more significantly, even foreign direct investment will remain niggardly.

CUSTODIAL RAPE

Cover-Up

NEW DELHI's bumptious confidence in conning everyone into believing its blatant lies surpasses that of the most successful tricksters, as evident from its response to the UN Human Rights Commission special rapporteur's queries about the rape of women in police custody in India. Expressing serious concern over reports of such incidents, the special rapporteur, Nigel S Rodley, sent a letter to our government last August seeking clarification about allegations of police rape of "generally poor women and those from vulnerable low-caste and minority groups who are taken into custody as suspects, or as hostages for relatives wanted in criminal or political cases or in order to extort payment to secure their release".

As any common citizen in any part of India can testify, the above allegation certainly fits the Indian police like a glove! But, since the union home ministry, as well as its counterparts in the states, have apparently come to a tacit agreement that allows the police to enjoy, among other perks, the absolute right to rape women in their custody (or even outside), the government of India in its official reply to the UN special rapporteur has come out with the amazing statement that "the reference (by the special rapporteur) to the vulnerability of women to rape under detention was unfounded and did not conform to the facts". It has then added the pompous claim, "Specific and clear-cut provisions had been made in the Indian Penal Code defining the offence of rape in custody and introducing a presumption against the accused. Custodial rape, if proved, could carry a life sentence."

Whoever in the New Delhi bureaucracy drafted this reply (dated December 9, 1993), was either ignorant of or deliberately trying to gloss over, cases of rapes in police custody in Delhi during 1993—leave alone the previous years and other parts of the country. According to an exhaustive report of custodial rape in the capital compiled by the PUDR (People's Union for Democratic Rights), from January 1 till July 16, 1993, at least four cases of rapes by policemen were not only reported, but had to be taken notice of by the police authorities who either suspended or dismissed the guilty cops. As for the previous years, the record is even worse. To give a few examples, the country's apex court, the Supreme Court, sentenced at least six policemen to various terms of imprisonment (including one constable to 10 years of rigorous imprisonment) for committing rape in police stations in different parts of the country between 1978 and 1985. The victims were mainly women from homes of daily labourers, rickshaw pullers, and domestic helps. Faced with this unsavoury reality, how can any government official have the cheek to claim that the allegation of "rape under detention was unfounded and did not conform to the facts'?"

But New Delhi was more irked, quite understandably, by the special rapporteur's queries regarding allegations of torture by security forces in Punjab and Jammu and Kashmir, and by charges of 'enforced disappearances' of citizens in Punjab. The allegations related to "brutal torture and rape (in Jammu and Kashmir)... as a means of extracting information from detainees, coercing confessions or punishing persons believed sympathetic to the guerrilla forces..." In its usual knee-jerk reaction, the Indian government has responded to this by bleating out the excuse—"India faces a situation of terrorism of unparalleled ferocity. In this environment, the normal criminal laws of the land and the systems by which they are operated have been rendered ineffective and inadequate", thus justifying the use of TADA, the Armed Forces Act, and other draconian measures.

In a gentle tone of reproach, the special rapporteur, while responding to this excuse of New Delhi's, has expressed the hope that the "Government of India is not seeking to invoke this serious problem (of terrorism) to condone torture." As for Punjab, the UN Human Rights Commission's Working Group on Enforced or Involuntary Disappearances has raised at least 213 cases of such 'disappearances' with the Indian government till now. The government has responded in 66 of them, but the Working Group could accept only 19 out of them as proper 'clarifications'. Of these 19, three are located in prison, and three have been traced outside. The remaining 13—the government admits—were killed, whose bodies have been identified. This leaves 193 cases of 'disappearances' which the Indian government is yet to account for.

While our ministers and their officials can get away by fooling an obliging parliament and a gullible national media at home, such tricks do not appear to cut much ice with international experts in law and constitutional values.

SIKKIM

Old Tactics

WITH the merger of the Sikkim Sangram Parishad(S) and the Congress(I), the minority Sanchaman Limboo government in Sikkim is likely to continue in office till the fresh assembly elections are held in November. According to Congress(I) spokesperson V N Gadgil there is neither a constitutional crisis nor a breakdown of the law and order machinery warranting the dismissal of the Limboo ministry. The Congress(I) has thus openly supported the perpetuation of what is undoubtedly an unprecedented political situation: in a house of 32 legislators, 17 have resigned their seats, reducing the assembly to less than half its strength.

The events leading to this situation were initiated by Limboo on May 5, when he, with 15 of his supporters, revolted against the then chief minister Nar Bahadur Bhandari and became, subsequently, the chief minister. However, on June 17 Bhandari, with the backing of Pawan Chamling, the Sikkim Democratic Front (SDF) chief, persuaded 17 MLAs to resign from the assembly. These included two from the ruling Limboo group, S D Lepcha, a minister, and H T Bhutia. Ever since then Bhandari has been demanding the imposition of the president's rule in the state.

Limboo's rebellion was sparked by the decision of the union finance minister Manmohan Singh, on May 4, to withdraw the proposed income tax exemption to the tribal Bhutia and Lepcha communities in the state. That the decision was deliberately timed is shown by the fact that Nar Bahadur Bhandari, who hails from the Nepalese community, had been demanding extension of the proposed exemption also to the Nepalese. This provided Limboo and his followers, belonging mainly to the Bhutia and Lepcha communities, with an opportunity to blame Bhandari for the withdrawal of the proposed legislation. The merger of Limboo's party with the Congress(I) confirms that the latter used the issue of income tax exemption to engineer the fall of the Bhandari ministry and install its own.

Apart from the fact that through these manoeuvres the Congress(I) has succeeded, up to a point, in denting the popularity of Bhandari among the Bhutia and Lepcha communities, the installation of its own government would enable it to use the state machinery for the purpose of managing a victory in the November elections. It has also put chief minister Limboo in a position to lure back into his camp the two MLAs, out of the 17 who resigned, whose resignation the speaker has not yet accepted. If these MLAs do come back, Limboo will be heading, once again, a majority government. Till that happens, there is substance in the state CPI(M)'s demand that the assembly be dissolved and the elections to be held in November be pushed forward.

Vijay Growth

VIJAY GROWTH FINANCIAL SERVICES which has been promoted by D B Reddy, M N Bhatt and Andhra Pradesh Industrial Development Corporation (APIDC), is a category I merchant banker and is active in issue management, loan syndication, leasing, investment advisory services and other financial services. The company which has underwritten over 100 issues in the past several months and has lead managed eight public issues to date is now planning to expand its activity base by entering the field of portfolio management and also enlarging its operations in major metros and mini metros in addition to penetrating deeper in the Andhra Pradesh markets. To part finance its plans the company is entering the capital market with a public issue of 35,00,000 equity shares of Rs 10 each at par on July 11.

Pondicherry Spinners

Pondicherry Spinners plans to enter the capital market with one of the smallest public issues in recent times aggregating Rs 90 lakh to part finance the setting up of a 4,000 spindle plant as also to meet its working capital requirements. The plant will manufacture cotton yarn of count 42s (hank yarn) and is well located near the major cotton growing areas like Salem, South Arcot, North Arcot. The company plans to sell its yarn to Pondicherry's government-owned weaving and processing co-operative, Pontex which presently procures its requirements from the Karur and Erode at relatively higher rates due to transportation costs. The public issue will open for subscription on July 6.

Rattan Vanaspati

A joint venture between Pradeshiya Industrial and Investment Corporation of UP (PICUP) and Rattan Bhushan Jain and his associates, Rattan Vanaspati is setting up a plant to manufacture vanaspati with an installed capacity of 62.5 tpd. Rattan Bhushan Jain and his associates who will have a 24.8 per cent stake (excluding PICUP's 11.93 per cent stake) in the post equity capital of the company have established such names as 'Melmoware' (for melamine crockery) and 'Geeflo' (for ball-point pens) in the domestic market. The project which is to be set up at a total cost of Rs 10.9 crore has not suffered any cost overrun despite a delay in implementation of one and a half years. The vanaspati manufactured will be sold in the northern region through a distribution network of wholesalers and distributors under the company's own brand name. The company plans to part finance the project through a public issue of equity shares of Rs 10 each at par aggregating Rs 4.7 crore which will open for subscription on July 5.

Gagan Gases

Promoted by K B Maheshwary and K R Maheshwary, Gagan Gases is currently engaged in manufacturing industrial gases such as oxygen, nitrogen and by-product liquid nitrogen at its plant in Pithampur. The company now plans to manufacture various other industrial gases like dissolved acetylene (1,80,000 cubic metres), hydrogen (2,16,000 cubic metres), carbon dioxide (7,20,000 kg), high purity nitrogen (2,16,000 cubic metres) and LPG bottling (4,80,000 kg). The project which is to cost Rs 5.2 crore is to be part financed through a public issue of equity shares at par. The issue aggregating Rs 3.11 crore will open for subscription on July 6 and the promoters will have a 31.11 per cent stake in the post issue equity of the company. Commercial production is slated to commence by August 1994.

Livewell Home Finance

A Secunderabad-based company, Livewell Home Finance was promoted in 1991 by EVPS Krishna and M Konaraiah for providing long-term housing finance for purchase or construction of houses/flats by individuals. The company plans to substantially increase its operations and proposes to enter the capital market on July 4 with a public issue of equity shares at par aggregating Rs 2 crore. The balance of the project cost which is being undertaken at a total outlay of Rs 17.9 crore will be financed through reserves of Rs 51 lakh, public deposits of Rs 2.5 crore and secured loans of Rs 12.9 crore. The promoters' stake after the public issue will come down to 50 per cent

Moser Baer India

Moser Baer India which is engaged in the manufacture of time recorders, 5.25" floppy diskettes, 3.5" micro floppy diskettes (MFD) is now setting up a 100 per cent export-oriented unit (EOU) for the manufacture of 3.5" MFD with 1 MB and 2 MB storage capacity with an installed capacity of 12 million nos per annum. It also plans to manufacture 5.25"/3.5" head cleaning kits, fax cleaning kits, anti glare screens, computer printer and monitor stands and floppy storage boxes at its computer peripheral division. Originally expected to commence production in October 1993, the company has suffered a time overrun of eight months and is now expected to commence production in June 1994. The project which is being implemented at a total cost of Rs 21.26 crore will be part financed through a public issue of equity shares of Rs 10 each at par. The promoter, Deepak Puri who has an experience of around 28 years in the manufacture of aluminium wires, electrodes and floppy disks, will have a 36.75 per cent stake in the post issue equity of the company. The issue aggregating Rs 5 crore will open for public subscription on July 7.

Super Polyfabriks

Super Polyfabriks which is engaged in the manufacture of HDPE/PP woven sacks commenced commercial production of tyre cord, its diversification project, in September 1993. The company's new project which was set up at a total cost of Rs 4.3 crore is situated at village Khagat in Ludhiana. The present daily requirement of tyre cord in the district of Ludhiana is about 35 tonnes as against the availability of only 20 tonnes and the cycle, rickshaw and moped tyres produced in the district as also in Jalandhar presently constitute about 80 per cent of the country's total production. Despite this the company has entered into a marketing arrangement for up to 87.5 per cent of its production capacity with Govind Rubber, Ralson India and Speedways Rubber Company. Further it also plans to supply its output to Hindustan Tyres. To part finance the project the company plans to enter the capital market with a public issue of equity shares of Rs 10 each at par aggregating Rs 1.8 crore. The promoters will have a 40 per cent stake after the public issue which opens for subscription on July 4.

Sita Enterprises

Sita Enterprises which is engaged in the business of organising exhibitions, trade fairs and finance and investments has applied for Category-I Merchant Banker status and National Stock Exchange membership. The company plans to diversify into the exports of textiles, garments, jewellery, colour stones and shellac and other agro products in addition to expanding its activity base in financial services. The company is entering the capital market on July 4 with a public issue of equity shares at par aggregating Rs 75 lakh in order to get its shares listed on the stock exchange. Ashok Tulsian and associates, the promoters, will have a 75 per cent stake in the post issue equity capital of the company

Though the rise in equity price indices has receded somewhat during the past week, the underlying situation in the share market has been one of increased tempo of activity with the monthly turnover in non-specified shares (Rs 2,298 crore) crossing that in specified shares (Rs 1,033 crore) in April 1994 because the former now include PSU shares. The price-earning ratios remain high at over 47. FIIs have increased their purchases and begun to book profits, with their net monthly investment touching Rs 800 crore in May and the cumulative net investment crossing about Rs 6,350 crore or $ 2.0 billion. Employment Exchange Statistics for 1993-94 showed an increase in registrations and reductions in vacancies notified as well as placements affected.

(Incorporated in Bahrain with Limited Liability)

BOMBAY BRANCH

Notes forming part of the accounts for the year ended 31st March 1994

I. Principal Accounting Policies

1. General

The financial statements have been prepared on the historical cost basis.

2. Foreign Currencies

(i) Assets and Liabilities in foreign currencies are translated at the rates prevailing at the end of the year.

(ii) Outstanding forward exchange contracts are revalued at the rates prevailing at the end of the year and the resultant gains or losses are accounted for. However, the contingent liability in respect of outstanding foreign exchange contracts is included at the contracted rates.

3. Investments

In accordance with the Accounting Standards for Investments laid down by the Reserve Bank of India, investment portfolio is classified into "Permanent" and "Current" categories.

Permanent investments are stated at cost adjusted for any premium or discount amortised from the date of purchase to date of maturity on a straight-line basis.

Current investments are stated at the lower of cost and market value.

4. Advances

Provisions for bad and doubtful advances have been made to the satisfaction of the Auditors:

(i) In respect of identified advances, on the basis of norms laid down by the Reserve Bank of India for identification of and provisioning for non-performing assets.

(ii) In respect of other advances, as a percentage of the total pre-tax profit for the year, after taking into account general factors that relate to latent doubtful debts which are not separately identified. Loans and advances are stated net of provision made under (i) above.

5. Revenue Recognition

(a) Interest income on all advances other than non-performing assets is recognised on accrual basis.

(b) Income from investments is accounted on accrual basis.

(c) Commission, exchange and brokerage is accounted on accrual basis.

6. Depreciation

Depreciation is provided for on fixed assets on the written down value basis at the following rates which are equal to/higher than those prescribed under Schedule XIV of the Companies Act, 1956.

Office Equipment	25%
Office Furniture	18.10%
Computers	40%
Vehicles	25.89%

7. Gratuity

The liability for gratuity is accounted for on the basis of actuarial valuation carried out once in two years. Gratuity liability for 1992-1993 has been provided for on the basis of actuarial valuation carried out upto 31st March 1993 and for the period 1993-94 has been provided subsequently.

8. Net Profit

The net profit disclosed in the profit and loss account is after:

1. Provisions for taxes on income in accordance with statutory requirements.
2. Provisions for doubtful advances.
3. Transfers to contingency funds.
4. Other usual or necessary provisions.

II. The difference as at 31st March 1994 between the book value and the market value of permanent investments has not been provided for, since these investments are intended to be held upto maturity and, in the opinion of the management of the Branch, the fall in the market value does not affect their realisable value at maturity.

III. Previous year's figures have been regrouped wherever necessary to make them comparable with the current year.

BANK OF BAHRAIN AND KUWAIT B.S.C.

(Incorporated in Bahrain with Limited Liability)

BOMBAY BRANCH

Report of the Auditors

We have audited the attached Balance Sheet of the Bombay Branch of Bank of Bahrain and Kuwait B.S.C. as at 31st March 1994 signed by us under reference to this report and the relative Profit and Loss Account of the Bombay Branch of the Bank for the year ended on that date

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with provisions of Sub-section (1), (2) and (5) of Section 211 and Sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The Accounts are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949.

We report that subject to and read with the foregoing remark:

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory;

b) The transactions of the Branch which have come to our notice have been in our opinion, within the power of the Bombay Branch of the Bank;

c) In our opinion, proper books of account, as required by law have been kept by the Branch so far as appears from our examination of those books;

d) The Balance Sheet and Profit and Loss Account of the Bombay Branch of the Bank dealt with by this report are in agreement with the books of account;

e) In our opinion, and to the best of our information and according to the explanations given to us, the said accounts read with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Bombay Branch of the Bank as at 31st March 1994 and the Profit and Loss Account gives a true and fair view of the Profit of the Bombay Branch for the year ended on that date.

PAPER PRODUCTS

Package Deals

PAPER PRODUCTS (PP), a 50-year old company engaged in the manufacture of flexible packaging, declared a bonus issue in the ratio of one equity share for every two held in 1992-93. The company's liberal bonus policy is reflected in the fact that more than 60 per cent of its equity (pre-bonus) was made up of bonus shares issued in the past. However, the company's better results were aided by a Rs 1.7 crore non-operating income resulting from sale of property and insurance claims. Consequently, despite a 39 per cent rise in net sales in 1992-93, the company more than trebled its net profit to Rs 3 crore giving an earnings per share of 22.7 on its Rs 1.35 crore equity capital. Moreover, though operating expenses increased more than proportionately, a lower rise in interest and depreciation charges further contributed to the higher rise in net profit. Despite the lower operating profit margin, the company raised the dividend rate from 20 per cent last year to 22 per cent.

Production of laminated and coated paper (which contributed up to 92 per cent of net sales) in 1992-93 rose by 36.7 per cent over that in 1991-92 to 3,947 mt while sale rose by 35.8 per cent to 3,992 mt over the same period and sale realisation was up 43.2 per cent. Production and sale of paper bags, wrappings and waxed paper was also higher. Meanwhile the company's modernisation and technology upgradation project was financed through a rights issue of 14,17,500 equity shares which was oversubscribed. The modernisation and upgradation programme envisages increasing the company's capacity from the present 3,808 mt per annum to 6,000 mt per annum and is to be implemented in two phases over a period of three years. The company's present clientele includes stalwarts such as Nestle, Hindustan Lever, Godrej, Colgate, Glaxo and Proctor & Gamble and with several multinationals demanding international standard packaging material PP has roped in Avery Dennison Manufacturing of the US to provide technical know-how for the manufacture of special reverse printed labels which are heat-transferred on to containers. Further, for manufacture of printed shrink sleeves, the company entered into a technical collaboration agreement with Fuji Seal Co of Japan, a world leader in this field. It has already set up facilities for manufacturing shrink sleeves and the facilities for manufacturing certified barrier metallised films were to contribute to the company's increased turnover in 1993-94.

The company also has plans to invest in its subsidiary, namely, PPL Feedback Packaging, to delink the bags division from the company's main operations and it has already applied to the government for the same. Meanwhile, the company made its first major foray into the export segment notching exports worth Rs 2.2 crore to the Middle East, Sri Lanka, Bangladesh and Mauritius.

The flexible packaging industry which is growing at an annual rate of 20 per cent can be divided into two segments, firstly, the 'premium' segment which includes packaging of products such as toiletries and food and the other being packaging of tobacco-based products such as paan masala. Meanwhile, for the year 1993-94, the company earned a net profit of Rs 2.4 crore on a net sale of Rs 82.5 crore as per the latest unaudited results.

KHODAY INDIA

Improved Performance

Khoday India (formerly Khoday Distilleries) which is engaged in the manufacture of Indian-made foreign liquor (IMFL) and sugar in addition to carrying out engineering contracts, improved its performance during 1992-93. While net sales increased by 21 per cent over the previous year, operating profit rose by 43 per cent due to a smaller rise in operating expenses. Though the rise in interest charges and tax provision was somewhat sharp at 37.7 per cent and 200 per cent, respectively, a lower rise in depreciation enabled the company to improve its profitability.

The distillery division (which contributes nearly 90 per cent of the company's net sales) saw a 39 per cent rise in revenue which went up to Rs 56.5 crore (Rs 40.6 crore) with a 29 per cent increase in production from 70.4 lakh bulk litres of IMFL last year to 90.8 lakh bulk litres and a rise of 27.4 per cent in sale from 75.9 lakh bulk litres to 96.7 lakh bulk litres in 1992-93. Despite a 22.5 per cent fall in production of sugar from 1.6 lakh bags to 1.3 lakh bags and a 12 per cent fall in the sugar division's sale, realisation improved by 11.3 per cent due to the higher prices obtained by the company. With the expansion programme at the division nearing completion, the division's performance is expected to receive a boost in 1993-94. However, the sluggishness in developmental activity in the state led to a drastic fall in the contract division's turnover which fell from Rs 5.3 crore last year to Rs 1.8 crore. Meanwhile, for the year 1993-94, the company's net sales increased by 8 per cent over the previous year to Rs 66.6 crore while net profit rose to Rs 3.8 crore.

MONTARI INDUSTRIES

Increasing Sales

The flagship company of the Bhai Manjit Singh group, Montari Industries is engaged in the manufacture of pesticides. The company achieved a 41.7 per cent rise in operating profit on a 11.6 per cent higher net sales in 1992-93. However, a sharp rise of 55.4 per cent in interest charges and a 23 per cent increase in depreciation provision led to a lower rise in the company's net profit. Despite the rise in profits the company's margins continued to be under pressure. Production of technical pesticides was lower by 20.6 per cent over the previous year at 905 mt while that of liquid formulations was lower by 4.5 per cent at 1,947 kl. Sale of technical pesticides was also lower by 14.2 per cent at 891 mt while that of liquid formulation was lower by 0.2 per cent at 1,182 kl. However, sale realisation of liquids saw an increase of 10.3 per cent due to the higher price obtained. Production and sale of powder formulations was also higher by 47.9 per cent and 55.7 per cent, respectively, at 655 mt and 693 mt. The substantial investment made in setting up facilities for the manufacture of a new insecticide called chlorpyriphos (technical) failed to materialise following difficulties in upscaling the product and bringing it to the rated capacity. Consequently, though commercial production started in January 1993, the production is yet to stabilise. Despite this the formulation of the product sold under the brand name 'Lethal' was well accepted in the market. 'Milron' emerged as number one brand in the country's wheat herbicide market.

Following conversion of part A of Rs 25 of the partly convertible debentures (PCDs) of Rs 100 each into one equity share of Rs 10 at a premium of Rs 15 in September 1992 the company's equity capital increased by 67 per cent to Rs 7 crore. Of the balance Rs 75 of each PCD, Rs 25 was converted on the same terms in September 1993 leading to an addition of another Rs 2.9 crore to the company's equity capital.

For the year ended March 1994 the company has notched a net profit of Rs 3.2 crore (a rise of 40.7 per cent) on a net sale of Rs 69.5 crore (a rise of 4.5 per cent). However, with the company divesting its stake in Bausch and Lomb India in favour of its three wholly-owned investment subsidiaries, the 1993-94 net profit is wholly made up of profit on sale of this investment. In fact, the group which set up two new

companies recently, namely, Montari Leathers and Bausch and Lomb in addition to an independent R and D centre, has reported an overall dip in profits.

MODERN THREADS

Expanding for Export

Jointly promoted by the Rajasthan State Industrial and Investment Corporation and H S Ranka, Modern Threads is engaged in the manufacture of industrial yarn and sewing thread. A sharp rise in interest charges and depreciation provision in 1992-93 led to a 14.8 per cent fall in the company's net profit. The steep rise in depreciation and interest charges can be attributed to the company's expansion scheme for setting up a 100 per cent export oriented unit (EOU) for the manufacture of synthetic blended yarn. However, the company's net sales increased by 44.9 per cent as compared to the previous year and operating profit rose by 55.7 per cent over the same period. The company's drive towards high value added fancy yarn varieties which yielded good results is reflected in the high value addition enjoyed by the company. Production of yarn and fabrics was higher at 4,731 mt and 6,851 mtrs, respectively as against 3,414 mt and 508 mtrs produced last year. Sale was also higher at 4,608 mt of yarn and 7,869 mtrs of fabrics as against 3,365 mt of yarn and 708 mtrs of fabrics sold in the previous year. Further, with the commissioning of its 100 per cent EOU during the year, exports jumped by 130 per cent to Rs 5.9 crore accounting for up to 11 per cent of net sales as against 7 per cent last year. Its order book position is reportedly comfortable with the company establishing its products in the international market and repeated orders are being received from overseas buyers.

Following the conversion of fully convertible debentures (FCDs) of Rs 150 each issued on rights basis and on private placement in 1991-92 into 10 equity shares of Rs 10 each at a premium of Rs 5 per share in April 1993, the company's equity capital more than doubled to Rs 5.35 crore leading to a fall in its debt-equity ratio to 1.5:1. Despite the fall in net profit the company has maintained the dividend rate at 15 per cent on the enhanced capital.

For the first six months of 1993-94 the company earned a net profit of Rs 1.1 crore on net sales of Rs 29.8 crore notching a gross profit margin (GPM) of 7.4 per cent which is higher than last year's GPM 5.9 per cent.

SIMPLEX MILLS

Further Modernisation

Simplex Mills (Simplex) which is engaged in the manufacture of cloth, yarn and paper and paper board was taken over from Forbes, Forbes and Campbell (now Forbes Gokak) in the early 60s by the Damanias. For 1992-93, Simplex's profitability suffered with net profit falling drastically by more than 60 per cent over the previous year. The operating profit was higher by 13.7 per cent on a 6 per cent lower net sale, a sharp rise in interest and depreciation charges took their toll on the company's margins with net profit margin falling from 4.3 per cent last year to a mere 1.7 per cent in 1992-93. Production of cloth (which contributed up to 70 per cent of the company's turnover) fell by 17 per cent from 202 lakh mtrs last year to 167 mtrs while that of paper (which contributed up to 20 per cent of net sales) fell by 13 per cent over the previous year to 8,401 mt. Sale of cloth and paper was lower by 15 per cent and 12.7 per cent, respectively, to 169 lakh mtrs and 8,227 mt.

The company has been modernising its operations since 1990 when it replaced its ordinary looms with 60 new airjet looms. Further it also modernised its spinning section. For covering upgradation costs which form a substantial part of investment costs in the textile industry, the company entered the capital market with a rights issue of 10,47,916 equity shares of Rs 10 each at a premium of Rs 70 per share aggregating Rs 8.4 crore. However, due to the increase in costs over the years the installation was phased over the period with the company completing the installation of Ruti-C looms during 1992-93. The company also commissioned a high efficiency fluidised bed combustion boiler in December 1992, the benefit of which is already being derived. With a view to improving the quality of its paper the company upgraded the paper machine. For the first six months of 1993-94 the company earned a net profit of Rs 44 lakh on net sales of Rs 41.7 crore as against a net profit of Rs 38 lakh on a net sale of Rs 39.2 crore achieved in the corresponding period last year.

Electoral Reforms: A Farce and an Opportunity

T S Sankaran

The government has promised to reintroduce the two bills on electoral reforms in the forthcoming monsoon session. While this may well be an occasion for parliamentary pugilistics, the issues that these bills raise are too serious to be left to political parties alone.

THE tragi-comedy that parliament and the country witnessed on June 13 and 14 is much too serious to be dismissed lightly. A special session of the parliament was summoned to get two bills—one to amend the Constitution of India and the other, to amend the Representation of People Act 1950 and Representation of People Act 1951—passed by parliament. Having failed to get these bills through parliament in the earlier session, where attempts were made to introduce them and get them passed at the closing stage of a long budget session, a considerable amount of head counting must have been done by the ruling party to assure itself of the required two-third majority in both houses to get the Constitution Amendment Bill passed, when the special session was held. A certain amount of accommodation to the demand of some opposition parties had also been promised by the ruling party. These included appointing the election commissioners in consultation with the chief justice and withdrawing the proposed amendment providing for the candidate for a Rajya Sabha seat to be merely a person eligible to vote in any Lok Sabha constituency and not specifically in the state from which the candidate seeks election to the Rajya Sabha. But, in the event, the entire exercise as also the special session convened with such fanfare and at considerable public cost, turned out to be a total fiasco.

One might have philosophically smiled at these antics and dismissed them from one's mind had it not been for the fact that electoral reforms are long overdue and are too important to be left to the political parties alone and that the ruling party has promised to redo the exercise in the forthcoming monsoon session of parliament. So, we are, hopefully (?), in for a bout of parliamentary pugilistics. The ruling party hopes this time to get its head count and alignment right to get the Constitution Amendment Bill through.

This breathing space of a few weeks serves a very important purpose. We are concerned not merely with the proposals contained in the two bills, but, far more importantly, in the total electoral process itself, in a process that will truly enable the people to participate in a working democracy, that will give them a crucial voice in the governance of the country. Any electoral reform that does not keep in view the above basic requirement will merely result in horse-trading between a limited number of political parties, of the kind that we have been witness to. This will be of a kind which will help enable 'recognised political parties' to perpetuate themselves at the cost of others and which will confirm the ritualistic role of the ordinary voter being called upon once in five years to cast his vote in favour of candidates who may have nothing to do with the voters and their problems and whom the voters see only at the time of the election and not after that till the next election. (This is not to deny that new political parties do get formed and some of them even graduate to the status of recognised political parties, but, then, these are few and far between.)

It is the intention of this paper to look critically but briefly at some provisions of these two bills, with the amendments proposed to them by the ruling party, and find out what exactly are the implications of these for the common man and woman of this country.

The Farce

The Constitution (Eighty Second Amendment) Bill, 1994 (Bill No 51 of 1994) contained two sets of provisions, one not controversial and relating to delimitation of constituencies in each state to be on the basis of the 1991 Census, and the other wholly controversial and relating to the functioning of a multimember Election Commission. It is a matter of great concern that the first proposal regarding delimitation should have been a casualty to the controversy on the second proposal. After all, Article 82 of the Constitution envisages such readjustment of constituencies after each census, but by an amendment carried out in 1976, the situation was frozen on the basis of the 1971 Census. The present proposal seeks to provide for such readjustment on the basis of the 1991 Census data, even though the allocation of seats in the Lok Sabha to the states will continue to be on the basis of 1971 Census. This is a proposal which met with no opposition but it became a case of emptying the baby with the bath water.

As regards the bath water, viz, the proposal to amend Article 324 and to introduce a new Article, 324 A into the Constitution, it is difficult to escape the criticism that the basic law is sought to be amended merely to curb the power of the current incumbent in the post of chief election commissioner, namely, T N Seshan. Apart from the manner of appointment of the CEC and other election commissioners, regarding which some compromise has been made providing for the appointment to be made in consultation with the chief justice of India, the introduction of new Article 324 A seeks directly to whittle down the primacy of the CEC and equates him with the other election commissioners. While a multimember commission is desirable, what is objectionable is the manner in which the whole exercise has been undertaken by the government, making no secret of the fact that the intention is to curb the independence and the initiative of the present CEC. Thus we have a bill which like the curate's egg is good in part but the motivation for which is, to say the least, dubious.

In passing, it should also be pointed out that the commencement clause of the bill leaves it to the central government to decide a date on which the provisions of the bill, after it has been passed by both houses of parliament with two-thirds majority and assented to by the president will come into force. If the matter is all that urgent, as evidenced by a special session of parliament, then the bill itself should have contained the provision that the act will come into force at once. Why leave it to the central government to decide when an amendment to the Constitution should come into force?

The other bill, namely, the Representation of People (Amendment) Bill, 1994 (and its Companion Bill containing further changes to the amendment bill slated to have been introduced in the abortive special session) do contain provisions which call for some discussion.

The first of the amendments provides for the Election Commission to direct the issue of identity cards to electors in a constituency or part thereof, as may be notified. The purpose, ostensibly, is to prevent impersonation of electors and to facilitate identification of electors. If so, one may query why it should not be a general provision instead of it being restricted to constituencies or parts thereof, as may be notified. Even this, according to the proposal, will require

the previous approval by the central government (and not the state government where the notified constituency is situated— it is after all the state governments who in the case of elections to state assemblies have to share the cost). Perhaps a working arrangement will be established under which the central government will consult the concerned state governments.

The second important amendment, which, incidentally, is being dropped by the central government relates to qualification for being elected as a member of the Rajya Sabha. The proximate reasons for this amendment appear to stem from the action initiated by the CEC against several members of the Rajya Sabha who got elected from states in which they are not ordinary resident. That better sense prevailed and the government decided to drop this proposal for amendment obviates the need for any further elaboration or comment on this original proposal.

An important amendment provides that no association or body shall be registered as a political party by the EC if it bears a religious name. An accompanying amendment provides for a complaint to be made (by anyone?) to the concerned high courts for cancelling the registration of a party when, *inter alia*, it bears a religious name. All these proposals may appear to be quite in order in a 'secular republic', but this attempt to separate religion from politics calls for a more detailed and in-depth analysis which it is not possible to embark upon in a small article like this. Suffice it to ask, whether in the same vein, the next step would be to debar all those persons from contesting elections who bear religious names? What is a 'religious' name? Apart from obvious names carrying appellations like swami or guru or reverend, most Hindu names do carry the names of gods and goddesses of the vast Hindu pantheon.

Apart from other amendments, such as reduction of the period of canvassing from 20 to 14 days and imposing a restriction on a candidate from standing for election from more than one constituency, a striking feature of the amendment bill relates to the distinction that is being made between 'recognised political parties' and the rest; the rest will include political parties not recognised by the Election Commission and the independents. (The government seems to have agreed to delete the provisions relating to state funding of election expenses of candidates of 'recognised political parties'. Even here, the intention seems a little sinister insofar as another important provision relating to deletion of Explanation 1 and Explanation 3 to Section 77 has also been dropped. These explanations, it may be recalled, were introduced in 1974 to get over the difficulty created by the judgment of the Allahabad High Court setting aside the election of Indira Gandhi, the then prime minister. Again a case of the baby and the bath water.)

As the amendment bill originally stood, candidates of recognised political parties seem to be a favoured lot: the security deposit they will have to pay is one-fifth of what a candidate set up by any other political party or one who contests the election as an independent will have to pay; the death of a candidate set up by a recognised political party after a valid nomination will result in an adjournment (and not a countermand, as the original provision stood) of the election, while, impliedly, the death of other candidates would not make any difference to the electoral process; state funding of elections, available only to candidates of recognised political parties, will extend to (a) supply free of cost copies of the electoral rolls as finally published, (b) supply free of cost quantities of diesel or petrol and such other material as may be prescribed, (c) payment of prescribed amounts on account of hire charges of microphones (including loudspeakers) and (d) supply of identity slips of electors in the constituency. These proposals, relating to 'recognised political parties' raise an important issue. Why are these 'recognised political parties' being singled out for state munificence? If elections are becoming expensive and therefore money power with its natural ally of muscle power becomes the crucial factor in deciding the outcome of elections, and if therefore the intention is to provide a level playing field, an expression

currently fashionable in the context of economic liberalisation, then it is precisely the 'recognised political parties' that must be singled out for denial of state funding of elections. As between a candidate fielded by a 'recognised political party' and another, the contest is clearly unequal, in term of money power; the common Indian experience is that it is these 'recognised political parties' that accuse each other of using money power, acquired through abuse of state power. It cannot be denied that recognised political parties include those responsible for criminalising political process in general and electoral processes in particular. In fact, the proposals contained in the bill relating to 'illegal practices' lists out a whole series of practices of abuse of state power, do confirm the point. To provide state funding for such 'recognised political parties' without even insisting on these parties to have their accounts audited and published giving details of the source of their funds will merely accentuate problems. If the ordinary man in the street were to be asked the question as to who should be eligible for state funding of election expenses, the overwhelming answer would be totally opposed to the proposals contained in the bill.

That brings us to the another serious objection to the proposal in the bill regarding 'recognised political parties'. The preferential treatment sought to be given to these parties—and in this there is no reference to the time allotted in the All India Radio and Doordarshan transmissions to these parties for electioneering—seeks not only to perpetuate these parties but also marginalises the Indian people in the electoral process. The provision to increase the qualifying proportion of valid votes from one-sixth to one-fourth so as not to lose one's deposit can also be viewed as an attempt to reduce ultimately the number of recognised political parties to three or four. If, along with this, there is at least a provision that no candidate who polls less than one-fourth or one-third of the valid votes can be declared elected, then one can legitimately claim that the winning candidate has a measure of popular support. But as the law stands, these minima do not apply to the 'winning' candidate.

Given the track record of these political parties, the Indian people seem to be sick and tired of them. The electoral process, as it has come to be over the years, appears to offer the Indian people only a negative choice of voting not for the person whom they would have preferred to represent them, a person who is known to the local people, but for one among the candidates of 'recognised political parties'. This raises the important question as to how the candidates for election are selected and by whom? The unseemly goings on at the headquarters of some of these 'recognised political parties' during what can be described as 'ticket melas' are clear indications of how far these are removed from the real desires of the people on whose behalf these high commands are supposed to select candidates and 'award' tickets; caste, religion, money power and clout are the deciding factors in awarding tickets; and not consideration of suitability of the candidates and the opinions of the electorate concerned. In this milieu, to further strengthen 'recognised political parties' through state patronage will remove these parties even further, if that were possible, from the people.

The amendment proposals also contain a provision according to which any bye-election for filling up any vacancy should be held within six months from the date of the occurrence of the vacancy, excepting where the unexpired positions of the term is less than a year. This is a salutary provision and must be welcomed, because we have had instances of such bye-elections being postponed almost indefinitely, leaving the electors in the constituency without any representative on their behalf in the legislature.

However, this does not solve the problem, becoming almost a norm in the country, of an entire state where elections are being indefinitely postponed. Currently, the state of Jammu and Kashmir is an example. Other examples are not wanting. Once President's Rule is imposed on a state and the legislature dissolved under Article 356 of the Constitution, it is really for the central government to decide when it thinks elections must be held in the state. Under the Constitution, President's Rule can be extended in the state from time to time, subject to approval of the proclamation by parliament, up to a total period of three years. This is a serious inroad into the rights of the people of the state concerned who are denied their right to choose their representatives to the legislature.

The Opportunity

The above brief analysis of the two amendment bills has been attempted to bring out some serious drawbacks in the bills. Reference must now be made to the most serious drawback in the bills, viz, the haste with which these bills had been sought to be rushed through parliament and the total marginalisation of the people—the ultimate repository of sovereignty—in the process. Electoral reforms, and in this term we include all those elements that go to or should go to make India a working democracy, are much too important to be left to governments and political parties. It is the people who matter and who are to decide. Denial of the opportunity to the people even to express an opinion on these crucial issues is the very denial of democracy. With the increasing disillusionment of the people with governments, political parties and the electoral process, it is open to debate whether at all political parties should be allowed to retain state power, whether and if so, what kind of state funding of elections is necessary and desirable, and whether the time has not come for people to evolve systems which will empower them and give them the real voice in the governance of the country. After all, the Constitution of India did not, till the 52nd Amendment in 1985, mention anything about political parties and the proximate reason for the 1985 amendment, popularly referred to as the Defection Law which incorporates the Tenth Schedule, was the sordid behaviour among members of various political parties of floor-crossing and an attempt to end (for whatever be the political reason) the era of 'Aya Rams' and 'Gaya Rams'. Thus, the reference to political parties in the Constitution did not have any edifying origin. That these 'Rams' are not persons sponsored by the people of the constituencies but imposed on them by the political parties only adds to the urgent need for basic changes in the electoral process.

In the context of recent amendment to the Constitution creating the third tier below central and state governments in the shape of nagarpalikas and panchayats, it is opportune now to initiate a debate into the entire question of the kind of political system that we should have in the country in which we the people of India are the ones that matter and the ones who decide. This question should be seriously discussed at various levels, in towns and villages and come up with proposals as to how the local people in each 'constituency' not merely vote for but actually select on the basis of their record of work, candidates to stand for election; how a system of 'recall' of elected representatives who do not carry out the mandate and wishes of the electors should be made operational; how the various bodies at different levels are made accountable to their 'masters'; how the entire system of governance is not top downward but bottom upwards, and so on.

These are the kinds of issues that require to be discussed and taken up for solution. It is not the intention to suggest, in this paper, any alternate model of our polity or a revised electoral law. These must evolve on the basis of a wide-ranging participatory debate. One would have liked to see these kinds of issues being raised and discussed in the media, instead of comments upon or discussions on the failure of the ruling party to master the required two-thirds majority or the discomfiture of the law minister in the Lok Sabha in introducing and withdrawing the bill or converting the entire debate into one regarding the pros and cons of T N Seshan. Far more serious issues are at stake.

Dalit-Intermediate Caste Alliance

Call to Greatness

Anil Nauriya

Kanshi Ram and Mulayam Singh Yadav have before them at least three fundamental questions which must be dealt with before the SP-BSP alliance can conceive of retaining power over a longer term. These relate to dalit relations with the intermediate castes, the impact of the dalit-intermediate caste alliance upon the Muslims and the relations dalits hope to evolve with those outside this electoral alliance.

AFTER the initial excitement over a dalit and intermediate caste alliance attaining power in the most populous Indian state, the parties concerned now have to turn their attention to evolving a political and economic vision for India. Kanshi Ram and Mulayam Singh Yadav have before them at least three fundamental questions which must be dealt with before they can conceive of retaining power over a longer term or of being able significantly to replicate such combinations elsewhere, assuming that they intend to do so. These three issues relate essentially to dalit relations with the intermediate castes, the impact of the dalit-intermediate caste alliance upon the Muslims and finally the relations that the dalits envisage with some of their countrymen and women who stand outside this electoral alliance.

I

First, it is necessary for them to address the question of economic contradictions between the scheduled castes and the intermediate castes. In the countryside this is primarily the contradiction between landless labour and the small or middle peasants. So long as the sting is not taken out of this contradiction, the alliance represented by the Bahujan Samaj Party (BSP) and the Samajwadi Party combination cannot endure. Does the Uttar Pradesh government have on its agenda any wide-ranging land reform that could help provide sufficient land to the landless to enable them to enhance their bargaining power in the rural labour market? Can we expect the level of land poverty to be reduced adequately so as to reduce the dependence of the landless on the rural labour market? Little is heard from the Mulayam Singh Yadav government about land reforms or distribution of land already declared surplus.

Let us assume, to start with, that this is so largely because of the standard argument put forward on behalf of state authorities in India that there is not much good quality land available and that a further round of land reform could result in economically unviable holdings. It is certainly possible that even if the dalit-intermediate caste combination, now in power in Uttar Pradesh, does not expressly indicate this to be the case, some such notion is part of its understanding. If Kanshi Ram's party really has the support of the bulk of the dalits and is not in fact riding piggy-back on intermediate caste support, land reform would ordinarily have been high on its agenda. The CPM regime in West Bengal after 1977 was able, -in the early years, to push ahead with legislative business and to put the central government in a position where that government was seen as holding up some of the bills reserved for the consideration of the president. Can the Uttar Pradesh government be expected to take similar initiatives?

Even if it is believed that the scope for land reform is limited for the time being, the problem of dealing with the economic contradictions between the dalits and the intermediate castes will remain. If not dealt with soon enough the 'UP model' will be under strain. There are ways of tackling these contradictions, if not directly, at least by side-stepping them. This can be done by developing other economic opportunities for the landless. They can be organised together in group poultry and dairy farms, fisheries and in many other agro-based activities with appropriate training, credit and marketing support from the government.

Ambedkar had conceived of resettlement of dalits in new areas so as to free them from the social hierarchies of the typical village environment and "the thraldom of the Hindus". This particular method of dealing with the problem may or may not be desirable or feasible; but there is much to be said for establishing small agro-industrial communes for the landless wherever possible. This is a concrete step that the present government in Uttar Pradesh can take and a way of addressing, in a secular way, some of the real problems of such groups. Besides, agro-industrial activity has the advantage, in contrast to agriculture that at least some of it can take place on land that may otherwise be unsuited to large-scale agriculture. Such land should be available in plenty and there can therefore be no excuse for not making it available. This would help a substantial proportion of the dalits by strengthening their relative economic position. In taking a large proportion of them out of the rural labour market, or at least in reducing their dependence on that market, the Uttar Pradesh government would have taken a major step in overcoming the economic contradictions that underlie the dalit-intermediate caste combination.

II

The next important question concerns the impact of the SP-BSP combination on Muslims in their relation to Hindus. To consider the impact of BSP politics on Hindu-Muslim relations, it is necessary first to consider the backdrop. The relations between Muslims and Hindus at large are delicate in post-1947 India. Both communities have collective memories of mutual grievances. Muslims are naturally wary of the rise in Hindu communalism in recent times. In the years after independence the bulk of the Muslims supported the Congress, looking upon it as the force that might keep Hindu fundamentalism in check. Many of them did so in spite of a host of real and imagined grievances which they had come to entertain in respect of the National Movement as led by the Indian National Congress. Over the years, the character of the Congress also changed markedly and one can legitimately ask whether and to what extent the party which bears its name today in fact represents the pre-1947 organisation. After 1947 the Congress suffered at least three significant splits. First, most of the socialists went out of the Congress in 1948. Second, the Congress old guard went out in 1969. Indira Gandhi was able to take her faction to a national electoral victory in 1971; but for that victory, her party was in every other way a break-away group from the main Congress organisation which then became the Congress(O). Some more democratically-minded people left Indira Gandhi's party, first during and after the 1975-77 emergency phase, and ultimately when her party suffered yet another split in 1978. Some of those who split away from her returned later. But they returned to a party which was in some ways as different from the earlier Congress as the Muslim League after late 1930s was different from the Muslim League of, say, the mid-1920s.

It was this new-fangled Congress, the Congress (Requisitionist) as it was called in 1969, or the New Congress as it was called for some time, or, after being identified for some years with the names of its various party presidents, which came to be finally known as Congress(I). It was the Congress(I) which gradually and ultimately lost the electoral support of the bulk of Muslims of north India.

Yet in all this, one development passed almost unnoticed. This was that as the character of the Congress, that is the Congress(I), clearly changed from what it

had been earlier and the Muslims gradually withdrew their support from it, there was also a parallel and simultaneous movement among them to a greater appreciative understanding of the national movement, for all its various flaws. An increasing number of Muslim intellectuals showed greater appreciation than they had earlier seemed to do, for example, of Mahatma Gandhi's role in the Hindu-Muslim context as also the role of Congress Muslims like M A Ansari and Maulana Azad. This change was keenly perceptible in the 1987-1993 phase even in Muslim fundamentalist journals. Thus while the Muslims at large were moving away from the Congress(I), many of them seemed simultaneously to move to a more sympathetic appraisal of the concerns of the national movement than had been the case some years earlier despite their support to the post-independence Congress. The demolition of the Babri masjid by the Sangh clan and the nonchalance with which the central government treated the demolition, again enhanced, within the Muslim community, respect for the ideals of the national movement, if nothing else, by way of contrast with the present. At last the effect of the assiduous post-1937 political activity of the Muslim League, which had sunk deep into Muslim consciousness in some areas, seemed to be weakening. This was a good portent for Hindu-Muslim relations because it had the potential of enlarging the political space available between the rival communalisms of the two communities. The irony was, however, that this phenomenon was occurring at a time when Hindu Communalism was on the rise.

It is in this scenario and at this time that Kanshi Ram and his party emerged with a larger presence on the political scene. His combination had achieved major isolated successes over the last few years but now, taking advantage of increased Muslim disillusionment with the Congress(I), it was able, with the help of the intermediate castes, to put through a winning combination.

For Kanshi Ram's political organisation and methods it was necessary to wean away dalits from the Congress(I) and other parties to itself and a large part of the strategy chosen for achieving this involved ignoring the differences that existed in quality, outlook and character between the Congress(I) and the pre-1947 Congress. It followed that attacking the Congress(I) was not enough; the whole nationalist anti-imperial ethos had to be questioned and debunked rather than being seen as part of the process of an evolving nationalism. Thus precisely at a moment when a large part of the Muslim intelligentsia had begun to show greater appreciation of the differences in character between the pre-1947 Congress organisation and the Congress(I), Kanshi Ram's party sought to involve them in an alliance in which precisely the opposite would be stressed. This strategy, if pursued in this form, can be expected once again to increase the distance between Muslims and the Hindus at large. A typical illustration of this process is the following. When after the recent BSP remarks on Gandhi, a Muslim leader refused to join in the mud-slinging, he was attacked by an Islamic fundamentalist journal. Pulling up the Muslim leader, the journal editorialised that defending Gandhi was equivalent to defending the kar sevaks who demolished the Babri masjid.

The particular caste politics pursued by the BSP thus has certain communal implications. Unless it is assumed that a deterioration in the inter-communal atmosphere is conducive to the growth and development of the BSP, it must fine-tune its strategies to avoid such a result.

III

This leads directly to the third problem that the SP-BSP combination has to grapple with—that is its relations with those Indians, including Hindus, who, though not seen as political allies by the SP-BSP, do not nurture any hostility to it and would in fact welcome the forces that the combination represents find expression. It is in this terrain that one may locate the Gandhi-Ambedkar controversies and the recent re-run of these arguments.

Ambedkar often used the English analogy in his arguments with the 'caste' Hindus. So if the Congress told the British that only an India with the assurance of independence could give effective support to Britain in the Second World War, Ambedkar in his turn told the Congress that only the 'untouchable' who knew what place he would occupy in the post-independence scheme of things could really join the struggle for national freedom.

In every hard-fought struggle, the natural effort is to search for allies wherever they can be found. It was natural therefore for Indians to cultivate as many friends as they could among British politicians of the time and especially in the British Labour Party. Indians often felt that the Labour Party and leading Labour leaders did not go far enough to help them and remained essentially imperialist at heart. (In fact, this was also the impression of many Englishmen including Wavell.) In spite of this, Indians sought to befriend such politicians. Carrying the English analogy further, one might have expected dalit representatives to cultivate as many allies as they possibly could among the non-dalit Hindus and among Hindus outside their definition of 'Bahujan Samaj'.

Gandhians have traditionally been sensitive to the dalit question, even if, as some dalit leaders maintain, they did not go far enough. Besides Gandhians, there were a large number of groups in the Gandhi-led movement, which did not see themselves as 'Gandhians' but held Gandhi in high regard as the leader of the anti-imperialist struggle. There were, for example, Marxists like Acharya Narendra Deva, who believed that it was reactionary to oppose the national struggle and progressive to support it. These traditions live on today and the CPI/CPI(M) Left has also come closer, in its analysis of the national movement, to positions that Marxists like Narendra Deva had already taken at the time.

Going by the Ambedkar reference to the nationalist attitude towards the British as a pointer to what the proper dalit expectation from the national movement ought to be, the BSP should, following the analogy in contemporary terms, seek to befriend sympathetic elements in the country's national life. The nature of the BSP outbursts on Gandhi would appear to push it into a corner, in which the task of seeking out and retaining such allies might become more complicated and could at some point create strains even in its existing ties with OBC-based organisations like that of Mulayam Singh Yadav.

In his 'What Congress and Gandhi Have Done to the Untouchable', Ambedkar takes the Congress to task for various things, but one of the episodes mentioned by him illustrates exceedingly well the dilemma of the times. He refers to the Temple Entry Bill which had been introduced in the central assembly by Ranga Iyer in the early 30s. The Congress had promised to support it. However, as soon as it became clear that the assembly would be dissolved and fresh elections held, the Congress backed out. Ambedkar then asks: "When the Hindus threaten to defeat the Congress in the election, if it pursues the matter to a conclusion, Mr Gandhi, in order to preserve political power in the hands of the Congress, give up Temple Entry! Is this sincerity?"

Temple entry was later taken up by provincial governments. For our present purposes, the relevant point is that in recognising the strength of the opposition to the temple-entry programme, Ambedkar obviously understood the cruel dilemma with which the Congress was faced. It could either turn entirely to social reform and become politically marginalised. Or it could hold back on the reform for sometime and carry on the political struggle. Ambedkar's criticism would have had greater relevance if it could have been shown that both aspects of the struggle could be taken to their fullest extent in the given situation. But Ambedkar himself recognised the strength of the orthodox Hindu opposition of the time.

It would be wrong, however, to assume that Ambedkar was motivated by any special animus against Gandhi. Ambedkar shows consistency here, and makes the same criticism of Lincoln. Lincoln had said of the

various opinions held in the American civil war:

If there be those who would not save the Union unless they could at the same time save slavery, I do not agree with them.

If there be those who would not save the Union unless they could at the same time destroy slavery, I do not agree with them.

My paramount object is to save the Union, and not either to save or to destroy slavery

This, Ambedkar concludes, throws:

...a very different light on one who is reputed to be the liberator of the Negroes. As a matter of fact he did not believe in the emancipation of the Negroes as a categorical imperative.

(Further on in the same work Ambedkar makes certain distinctions between Gandhi and Lincoln to the disadvantage of the former.)

This method of analysis does not take account of the complexities of crisis situations, of life, of movements and of individuals and it ignores completely their relative placement in a given social configuration. It demands that even a sympathetic ally or party pursuing an immediate unexceptionable objective should be required to prove its credentials even if the method or extent of proof demanded be such that the primary objective being pursued by that party is itself jeopardised. This is not a basis on which personalities and movements can be fairly judged.

The essential point, however, is not whether Ambedkar was right or Gandhi was. The real point which the BSP should perhaps be stressing is that all the reasons that could be marshalled in favour of granting primacy to the political struggle at the time of the Gandhi-Ambedkar controversies ceased to be relevant after 1947. Therefore, the present condition of the dalit is an unqualified critique of the post-colonial state. Formulated thus, the BSP can at least make itself open to, if not actually muster, an immensely larger support base. Many who consider themselves Gandhians and many others who though not Gandhians retain high regard for Gandhi's work and also those in that part of the Marxian tradition which had identified itself entirely with the national movement, can be expected to be firmly on the dalit side of the struggle.

It is a mistake to identify the Gandhian tradition in Indian political and social life with the state. The BSP, along with some other groups makes an error in thinking of 'Gandhi' as political shorthand for the present day state and the ruling Congress(I) and in thus feeling obliged to make angry attacks on (rather than balanced appraisals of) Gandhi in order to make contemporary political points. There is obviously an attempt by the BSP to refer not merely to Gandhi as a person but to use him as a kind of emblem to represent all such non-dalit non-'Bahujan' Hindus who claim to share or at least understand the dalit agony. The attack on Gandhi is thus a symbolic assertion of the policy of political exclusivism on the part of the dalits or on behalf of the larger category of 'Bahujan Samaj'. Although the state did attempt after 1947 to claim the Gandhian legacy, the distance between that legacy and the state as well as the major centrist political parties is very wide. It was pointed out in the constituent assembly itself that the Constitution had few Gandhian elements in it. Later on, the life-style of the politicians and bureaucrats similarly moved further away from the people. Some of Gandhi's ideas may be seen as impracticable—but even his more common sense suggestions in practical matters were ignored. Gandhi's suggestions on Hindustani as against Hindi were rejected. His emphasis on 'basic education' was brushed aside. The rise of Hindutva (and the failure of the state to bring communal offenders to book, and of the Congress(I) to tackle them politically) has only this relationship with Gandhi that he had kept it adroitly under check, not sparing in his day even Swami Shraddhanand from piercing but respectful criticism. It is ironically in the current year of Gandhi's 125th birth anniversary that the chasm between his thought and the Congress(I) has been sharply underscored making it clear that while such parties might in their relatively lucid movements reach out for aspects of the Gandhian legacy, they cannot claim it by right. This is evidenced by the spectacle of the ruling party at the centre, which presents itself as upholding Gandhi's legacy, having to be brought to account for its involvement in the November 1984 riots by a Bharatiya Janata Party (BJP) government in the National Capital Territory. The BJP, for its part, has false pretensions as its cadres, to give only a couple of instances, still proffer justification (its official positions notwithstanding) for the assassination of Gandhi and the destruction of the Babri masjid. The connection between Gandhi or 'Gandhism' and the state or the major centrist parties does not carry conviction. What affinity can there be between a state which enacts and maintains the Terrorist and Disruptive Activities Act (TADA) and one who first emerged upon the national scene with a vigorous challenge to the Rowlatt legislation?

Gandhi saw it possible to go so far as to condemn untouchability, campaign against it and to declare the general proposition that any Hindu scripture that was contrary to reason had to be rejected, thus putting traditional Hindu society on the defensive. In the context of those times when even temple entry questions aroused widespread opposition this was no small achievement.

But the choicest political invective is sometimes reserved for those relatively closer to one's own position. For instance, to consider a slightly different context, the 'Platform of Action of the CP of India' published in *Pravda* in 1930 had this to say of Nehru's more sharply Leftist phase:

The most harmful and dangerous obstacle to the victory of the Indian revolution is the agitation carried on by the "Left" elements of the National Congress led by Jawaharlal

Nehru, Bose, Ginwala and others...

The greater understanding is sometimes reserved for the one who is safely outside and perhaps even ranged against one's own struggles. Thus leading Jews could overlook some of Voltaire's anti-semitic 'fervour' by taking a broad view:

> However, that may be, the Jews forgive him all the ill he has done them, in consideration of the good he has done them, although involuntarily perhaps even unknowingly; because if they are enjoying a little peace for a few years, they owe it to the advance of the Enlightenment, to which Voltaire has certainly contributed more than any other writer, by his numerous works against fanaticism.

The memory of Gandhi is, if anything, a resource available to the BSP and all groups that seek to speak for the depressed for it is the groundwork initiated largely by him that has helped prepare non-dalits for social change. It can reject this resource only if it believes that social reform comes in one fell stroke and that since Gandhi did not see his way to go far enough he was, therefore, ranged against the dalits. By not appreciating this matter or the difference between the present and the pre-1947 situation the BSP would be denying to itself the widespread support for dalits that may be available outside the ambit of its own self-definition. In the new context, the BSP may have to move to some extent beyond Ambedkar and overcome the isolationist tendencies of the past by making allowance for the notion that it is possible for a non-dalit to be genuinely concerned over the oppression faced by dalits. If the possibility or genuineness is accepted, it is not necessary to waste time on the question whether such concern can equal that felt by the dalits themselves. The African National Congress has little difficulty in functioning on this basis and there is no reason why the BSP cannot see its way to do likewise.

It is paradoxically in moving beyond its isolationist legacy that the dalits can arrive at a larger fulfilment of Ambedkar, to whom Lohia, the ideological master of Mulayam Singh Yadav, had written in December 1955 that "Sympathy should be joined to anger" and that he should aim to become "a leader not alone of the scheduled castes but also of the Indian people" If the SP-BSP combination can so function as to make this its object it will give cause to rejoice in the emergence of a combination that has it within itself to replace the decaying parties of India's political centre. Few persons have understood this better than Gandhi himself. In January 1940 he wrote in *Harijan*, welcoming the move by Jinnah to bring about a combination of parties opposed to the Congress by creating an alliance between, among others, the Justice Party, Ambedkar's party and the Muslim League. This was partly a precursor to the alliance structure sought to be built up by Kanshi Ram and Mulayam Singh Yadav. Gandhi saw such a combination as lifting these groups out of the narrow channels within, which each had till then functioned (and consequently, he hoped, implying denial of the two-nation theory). Gandhi, therefore, wrote:

> Such an alignment of parties is a consummation devoutly to be wished: If the Quaid-i-Azam can bring about the combi-nation, not only I but the whole of India will shout with one acclamation: 'Long Live Quaid-i-Azam Jinnah' For he will have brought about permanent and living Unity for which I am sure the whole nation is thirsting.

Jinnah, seeing the chink in the two-nation theory, wrote back on January 21, 1940 declining the compliment and saying that while the combination was indeed being attempted, "India is not a nation, nor a country" and that the alignment was "partly a case of 'adversity bringing strange bed-fellows together' ".

As the two-nation theory is also now no longer in the way, it is open to Kanshi Ram and his party to accomplish what Jinnah declined to do and to bring about, with the help of enlightened support from groups like Yadav's and other Indians, that wider social 'consummation', not only in Uttar Pradesh but throughout the country. Can he and Yadav rise to the occasion?

A Blanket Spread Too Thin

Compensation for Bhopal's Victims

Paul Stanton Kibel
Armin Rosencranz

The individual-based compensation distribution scheme currently existing in Bhopal fails to respond to the severe disaster-related medical and social distress.

IN 1986, the Bhopal Gas Leak lawsuit was filed with the district court, Bhopal. The district court's interim ruling was appealed to the Madhya Pradesh High Court, and eventually to the Supreme Court of India. While the case was still pending before the Supreme Court, and with the Supreme Court's intercession, the Indian government and Union Carbide reached a settlement. The settlement required Carbide to pay the Indian government $ 470 million This settlement fund would be supervised by the Indian Supreme Court, and distributed to those who had been injured, and the surviving families of those who had been killed, in the Bhopal disaster.

The existing Bhopal settlement distribution scheme is based exclusively on compensating specific claimants for death or injury. This individual-based distribution scheme, by itself, fails to respond to the severe medical and social consequences of the Bhopal disaster unless it is integrated with 'community-based' distributions which would fund institutions, programmes, and services that serve the larger, collective group of persons injured and adversely affected by the Bhopal accident providing effective long-term relief and assistance to survivors, and would serve as a landmark case of disaster relief.

Under the Bhopal settlement distribution scheme envisioned by the Supreme Court, 30,000 individuals were expected to receive compensation payments. These individual compensatory payments were intended to cover a host of costs and concerns, such as pain and suffering, lost wages, and incurred and future medical bills. The amount of compensation that each individual was to receive would be determined by the severity and permanence of the individual's injury.

The claimant classification system promulgated by the Supreme Court adopts the following categories: fatality, temporary injury; permanent injury; temporary disablement caused by temporary injury; temporary disablement caused by permanent injury; permanent partial disablement; and permanent total disablement The compensation for an individual fatality was estimated at approximately $ 14,500. Although originally 30,000 claimants were expected, the class of claimants may expand to 300,000. Because the total settlement is fixed, this enlargement could drastically reduce the amount of money each claimant would receive. This enlargement could also drastically increase the administrative burden placed on government officials.

Although the individual-based compensation scheme may appear as an appropriate, effective and fair response, the scheme possesses many flaws. These flaws render the scheme dysfunctional, and prevent the Indian government from achieving basic medical, social and justice-related goals. The three primary flaws concern (1) administrative burden and time delays, (2) the susceptibility of claimants to exploitation and manipulation; and (3) most importantly, the failure to provide for the future of the Bhopal community and affected unborn generations These disadvantages are considered below.

The processing of up to 300,000 individual claims for compensation places a tremendous administrative burden on the government and courts. The government must give notice, process claim applications, conduct and review medical and financial assertions, as well as disburse each claim. In discharging these tasks, substantial financial costs will be incurred. The administration of this large claim, evaluation, and disbursement apparatus will also result in time delays. These time delays may prevent many desperate, injured claimants from obtaining the money they need for immediate survival. If the number of claimants is expanded to 300,000, the administrative and time delay problems will increase accordingly. This increase may prevent the government from effectively responding to the widespread suffering, displacement and poverty caused by the Bhopal accident.

The vast majority of Indian citizens injured or killed by the Bhopal disaster were uneducated and illiterate. Because of their circumstances, most of these people have a limited understanding of modern commercial and financial dealings. This lack of experience renders them, and their newly acquired assets, particularly vulnerable to outside exploitation and manipulation. To believe that such exploitative and manipulative efforts will not be made is both naive and dangerous. The injection, over time, of up to Rs 2,000 crore into the local Bhopal community will attract the interest of those seeking access to this vast sum of funds. Some may come offering insurance or annuities. Some may come offering products or services. Some may come offering investment opportunities. Although the specific angle such 'interested' persons will take remains uncertain, one thing is sure. They will come. Being illiterate and uneducated, the Bhopal claimants will likely prove susceptible and vulnerable to such outside efforts. If these outside efforts are successful, the result will be a *de facto* transfer of Bhopal compensatory claims to private business interests. If this happens, the Bhopal victims will find themselves in the same condition of suffering, poverty and injustice that they have endured until now.

The Bhopal disaster placed 40 tonnes of highly toxic methyl isocyanate (MIC) into the Bhopal atmosphere. In addition to the death and injury it inflicted on Bhopal's citizens, the release of MIC had other adverse effects. It rendered much of the agricultural land unsuitable for farming. It rendered much of the surrounding area uninhabitable. It also, according to most medical experts, will cause increased birth defects among future generations.

The individual-based Bhopal compensation scheme does not confront these issues. There are no provisions for detoxifying the soil or for assisting former farmers. There are no provisions for addressing the problems of wide-scale population displacement. There are no provisions for the medical care of the unborn. Unless these larger, broad-based problems are addressed, the settlement will not truly succeed in compensating or rehabilitating the victims. To effectively compensate these persons, the distribution scheme must provide for the future of the Bhopal community and the welfare of its affected unborn generations.

Alternative Scheme

There is an alternative to the flaws and limitations of the individual-based distribution scheme—'community-based' compensation. Under this model, only a portion of settlement funds are distributed directly to individual claimants. A significant fraction of settlement funds are invested in institutions, programmes and services that will collectively benefit the entire class of claimants. The theory behind this alternative distribution scheme is simple. The claimants will derive the greatest benefit from pooling a portion of their individual claims, and developing an ongoing financial framework to deal with the Bhopal community's problems and needs.

Under the community-based model, instead of providing individual claimants with funds to cover medical costs, the Indian government would invest in modern hospitals to treat the injured. These hospitals would be specifically designed to meet the needs of the Bhopal victims, with staff and facilities to deal with issues such as post-traumatic stress syndrome, genetic counselling and mental health generally. These hospitals would be for the exclusive use of, and at no cost to, Bhopal victims and their future affected generations.

Under the community-based model, instead of providing individual claimants with funds to cover soil detoxification and family relocation costs, the Indian government would invest in technologies, services and facilities designed to address these problems. Once again, these programmes would be free, and for the exclusive use of Bhopal victims and their future affected generations.

Beyond the immediate problems of medical care, land detoxification and population relocation, the community-based model could also effectively address other local problems. Settlement funds could be used to establish schools, programmes for job retraining and new housing construction. While these expenditures and services may not be directly related to the Bhopal disaster, they will obviously help to improve the welfare of the Bhopal community. Because improving the welfare and condition of the Bhopal victims was the central aim of the settlement, these types of programmes are wholly appropriate compensation strategies.

In addition to providing effective relief, under the community-based model, settlement monies would not be as vulnerable to exploitation by private business interests. Provided that the model contained effective internal checks and outside supervision, the real social and economic benefits should reach the settlement's intended beneficiaries, the victims of the Bhopal disaster.

The alternative community-based distribution scheme should not be thought of as completely inconsistent with the individual-based model. It is possible for one compensation scheme to retain elements of both. For instance, the Indian government could offer individual-based compensation for fatalities and permanent total disablement. For all other injuries, claimants could be given free access to the programmes and services established under a community-based model.

The advantages of the community-based distribution model can best be understood by referring back to the three primary flaws under the individual-based compensatory approach. First, there is a smaller administrative burden in operating a handful of community programmes than in processing 300,000 individual applications and claims. Second, because many claimants would receive service benefits rather than monthly cash payments, there is less opportunity for outside exploitation. Lastly, because the community-based model establishes ongoing programmes and services, it will be better able to serve the future interests of the Bhopal victims.

The Bhopal settlement provided the Indian government with $ 470 million to assist and benefit the Bhopal disaster's victims. With the devaluation of the rupee, and accumulated interest, this sum has grown even larger. Having secured these funds, the Indian Supreme Court must now help local authorities develop an effective, fair and feasible distribution scheme. While the existing individual-based compensation scheme is well-intended, it possesses many flaws. Because these flaws may render the scheme dysfunctional and ineffective, we urge the Supreme Court to consider alternative compensation models. More specifically, we believe the Supreme Court should integrate elements of the community-based compensation model into its Bhopal distribution strategy.

The integration of community-based distributions, even if initiated by the Supreme Court, should not be controlled from the top. Rather, the decision of which programmes to fund, and how much money to allocate, should be left to the people of Bhopal. These citizens are in the best position to evaluate the problems and needs of their community, and to determine how the funds can be most effectively spent. To further this local empowerment, the Supreme Court or the Madhya Pradesh High Court could appoint a panel of widely respected Bhopal citizens to speedily establish programme priorities. Only by empowering local citizens will the community-based programmes be responsive to the critical medical, social and economic needs of the Bhopal victims.

Major's Little England

Corporate Meltdown

Frederic F Clairmont

The German seizure of Rover is not only a debacle for a once robust British car industry, it signals the inexorable withering away of an already anaemic manufacturing base.

"BMW swallows Rover", crowed *Bild*. It went on to proclaim that BMW's chairman had crafted "a masterpiece of industrial policy", Britain had been blitzed and busted. No doubt the attributes of the Herrenvolk, the triumph of Germanic organisational genius, unbeatable marketing skills. The crap goes on. In short, it was these Nazi-like supermen qualities that had made BMW one of the powerhouses of German industrial engineering. The pride of authentic Germanic capitalism. The German stock markets echoed their approval and BMW's stock soared.

The sheer brilliance of the annexation *Bild* ranted was that the consummation of the coup had uplifted a Germany stricken with crisis and bathed the whole of German industry in sunshine. There was only one way to go and that was "onwards and upwards". Translation: bigger and bigger market shares, fatter and fatter profits for mega German corporations. The corporate pro-Nazi media joined the chorus. The massively concentrated multi-billion-mark yellow press was in a state of apoplectic celebration so redolent of the October and November days of 1989 that marked the annihilation of the GDR and the biggest real-estate scam in all history.

Perhaps more luminously, another leading yellow tabloid caught the spirit of global economic war and inter-imperialist rivalries in a classic one liner that could not be bettered. "Sure we lost the last war. What matters now is that we've won the economic war. The bulldog is sick and toothless." In the grim and utterly despondent state of contemporary Britian, the nation appears tragically to be immune from shame and humiliation.

The war was occurring in a specific inter-imperialist configuration: aside from the economies of the Pacific Rim, the world economy was in a state of chronic instability with joblessness hitting record levels; undercapacity working in all industrial sectors hovering tremulously at around 65-70 per cent, the lowest in the post-war years; massive closures and retrenchment in all industrial and service sectors with no prospects of the hurricane moving on.

It is not fortuitous that the appearance in January of the UK's official Social Statistics, coinciding with the acquisition, indicated that 21 per cent of the nation's assets are held by less than 1 per cent of the population, a spectral number that is rising ominously. Despite the slippage of global export and output aggregates and its agonising social corollaries, the economic gulag continues its boom.

Simultaneously with the gobbling up of Rover at a cost of $ 1.4 bn, the Bank of America Corp annexed Continental Bank Corp of Chicago for $ 2 bn in the sixth largest banking combination ever. The Bank America/Continental fusion germinates a bank holding company with assets of $ 209.6 bn, second only to Citicorp among US banks. The deal has other ramifications for big capital. Rationalisation follows: over the next two years more than 2,000 bank employees will have been junked. Let us get the picture straight: the gulag's liquidationary strategy is taking place not because profits are in a hole but to boost profits. The same logic of uninhibited greed applies to BMW's devouring of Rover.

For the intellectual compradores in the service of economic liberalism now hollering at full throat for industrial 'restructuring', 'liberalisation', 'privatisation' and the familiar panoply of the World Bank/IMF, the lesson to be drawn from the BMW/Rover dossier is unequivocal. It is wholly destructive of any kind of coherent industrial and economic policy. Corporate aggrandisement does not, however, formulate policies on the basis of ethical concerns.

Two of the traditional prides of Englishmen from the industrial revolution of the 18th century to the 1960s were the twin pillars of the British empire and the spectacular achievements of its industrial engineering. The shipbuilding industry is dead. Britain's premier computer group ICL was grabbed by Japan's Fujitsu. The empire has gone. What remains of its industrial heritage, including the automobile industry, is in the throes of extinction. Lord Nuffield, the pioneer of the British automobile industry, would now be quivering in his grave.

The German seizure of Rover is not only a debacle for a once robust indigenous car industry, but, even more cataclysmic, it signals the inexorable withering away of an already anaemic manufacturing base. A process that reached its zenith in the Thatcher years. A state of play that appears irreversible even to demoralised treasury officials and the enfeebled government itself still peddling defunct *laissez-faire* mouthings.

Obviously, the strategy of manufacturing policy cannot and should not be divorced from overall government economic policy. In the rampantly corrupt cabal of the Major cabinet, there is no such policy. When Norman Lamont, the former chancellor, himself the epitome of a wobbly politico, declared that the government was "weak and hopeless", he was venting not only his personal pique at having been booted out of the cabinet and being used as a scapegoat for the UK's withdrawal from the ERM.

It was the case of the pot calling the kettle black and the fire calling both sooty. The pathology of Tory misrule that has shovelled the country into a fourth-rate niche goes beyond individual invective and recrimina-tions and counter-recriminations that reverberate within and outside parliament. There was hardly a whimper at the takeover in Westminster. The exception was Tony Benn. This is understandable; the party itself is the victim of endless sexual scandals and of graft and corruption that have scaled new heights.

The Tory machine is the natural house for corporate capitalism. It was conceived as a party of an oligarchic caste and it has never deviated from its goal; it is a coterie whose policies and pattern of conduct are consistently anathema to the national interests, a point devastatingly spelt out by David Lloyd George in the 30s: "Scratch a Tory and you'll always find a fascist"

Westminster, during and after the Thatcher years, has been a source of prodigious enrichment for the Tory caste. Naturally, the source of the Tory payola has emanated from a staggering variety of sources including West German and Japanese capital, US Chambers of Commerce, the CIA and last but by no means least South Africa's mega-conglomerates. All kinds of shady traffickers have made their contributions. Tory money-boxes are not open to public accountability. Over nine-tenths of its parliamentarians are intimately enmeshed with the city; many are on several boards of TNCs. The Westminster Tory club exhibits the highest concentration of millionaires in the UK. Why should this be surprising?

Given the very nature of the gulag-media, the nexus of political and financial power is rarely if ever divulged. Sexual

peccadilloes and ups and downs of a decadent monarchy is fair game for the yellow press. It deflects opinions from the underlying realities of big capital and their political agents.

Whether or not there were cash flows between BMW and the Tory caste to facilitate the political passage of the takeover cannot be ascertained. What is important are the implications of this acquisition. What it signalises is the total loss of control in all stages of decision-making that has passed to another country. Germany has three major car groups; the UK has none. The replacement for the Rover 8000 will be based on a five-series BMW platform. All future research and development will be concentrated in Germany, a feature that is now a banality in TNC practices. The workforce will be trimmed. The union is slated to be axed.

This simply means that Rover car production will inevitably become an assembly unit. BMW will acquire Rover's dealers which it wants. Also BMW will concentrate resources in Land Rover since this is the grand prize that BMW has always coveted. The first claim and its ballyhoo is an indicator of the future. At the time of Rover's takeover by British Aerospace, there was a lot of doubletalk about synergy. The rhetoric was hollow then. Little investment was made in Rover and it was dumped when Aerospace needed a new injection of cash flows.

The public relations cant that BMW will be investing massively in Rover will not wash. The decision to invest or not to invest or simply pull out of the country altogether and move elsewhere is no longer a British decision but a German corporate one. What has happened in the case of Ford and Vauxhall? The design and engineering skills have been moved out of the UK into Germany. The UK is nothing more than a location for low-cost assembly.

The trouble with low-cost countries is that, as one analyst commented, there is always another low-cost country coming up behind. Vietnam is a case in point. Corporate capital that comprise the economic gulag have no compunction whatever about shifting location to remain 'competitive', to use their jargon. This single dossier from the auto sector is a source of invaluable reflection on the nature of inter-imperialist rivalries in all its facets. The disastrous course of Tory policy over the last decades was and continues to be a design for disaster; a dossier whose wider analytical significance goes well beyond Major's impoverished and enfeebled island.

Regional Politics in Russia

Anuradha M Chenoy

Regional variations in political power and economic structures in Russia have led to struggles for power and control of resources. While the centre has used the disputes between the republics and provinces to play off competing territories against one another, the regions have adopted varied tactics to pressurise the centre.

IN Russia the 'region'—the territorial unit administered by a local government—has today become a powerful entity. Regional elites constitute important players in the struggle for power and control of the great redivision of state property, since economic and political reform efforts have to be implemented in the regions. The role of the regions as influential actors in the Russian political scene has been demonstrated during the Russian referendum, and the local and national elections. The future of the Russian federation thus lies in its regions.

Regional Structure and Federalism

The Russian federation is divided into 88 units. Of these 55 are provinces/regions (oblasti, kraya), two cities (Moscow and St Petersburg), 20 republics (earlier known as the Autonomous Soviet Socialist Republics—ASSR), and 11 autonomous formations. These formations are enclaves within some of the regions that have a special status associated with their titular nationality. This division was made on nationality basis by the Bolsheviks in 1918, and has influenced regional politics since then. Power and rights varied according to these categories, and the regions' relation with the centre depended on this.

The establishment of the Russian federation after Soviet disintegration necessitated reformulation of the federation, and reopened debates on rights and privileges of the federating units. Political movements relating to the federal structure originated around these debates. Movements from some republics are secessionist in nature (Tatarstan and Chechnya), while other republics want to maintain their rights and privileges within the federation. The provinces have been mobilising for political rights and economic autonomy. The autonomous entities have demanded statehood.

The negotiations for forming the Russian federation and drafting a constitution became complicated because of the disputes between the units. The republics insisted on maintaining privileges received during the Soviet period (even though these had not been practised until the Gorbachev regime). They insisted on ownership of subsoil and other resources on their territory. The provinces argued that these rights would mean sovereignty for the republics.[1] Drafts of a federal treaty which did not ensure special rights were not approved by 14 of the 20 republics.[2]

The Federal Treaty of March 1992 appeared as compromise documents which president Yeltsin and speaker R Khasbulatov promoted. The final treaty showed that the pressure from the republics had been acceded to.[3] The Federal Treaty stated that the republics "possessed full state power" (except for those powers that had been transferred to federal bodies). Ownership and administration of land, subsoil and other resources was left to the republics (shared with federal authorities). Emergency measures could only be levied after consent of the republic concerned. The republics retained the right to sign the treaty, which was to become part of the new constitution.[4] Tatarstan, Chechnya and Ingushetia held out, while other republics signed.

The Federal Treaty gave legal sanction to the republics' special privileges and initiated new debates and movements in the provinces. The city and provincial elites questioned the republics' right to statehood because of the demographic pattern of ethnic pluralism in Russia. The 1989 Census shows that in only four of the 20 republics was the titular nationality in a majority. In nine of the 20 republics, Russians are in majority. Less than 55 per cent of the total population of the eponymous live within the borders of these entities.

Regional representatives argued that republics and autonomous areas are no longer populated solely by eponymous people. Thus if the criterion for statehood is that it be populated by a majority of eponymous people, even Tatarstan would not fulfil this criterion. It was further argued that the right to national self-determination was to be granted when cultural development is unattainable except through statehood. Moreover, practice has shown that statehood does not guarantee a nation's free cultural development.[5] Thus, for instance, the Tatar elite is not helping in the solution of cultural or social problems in Tatarstan, but only urging the people to struggle for expanding the framework of statehood.

Discrepancies within the federal budget were also used to criticise the republics' demands for statehood. All the 15 regions which receive more from the common treasury than they put into it are republics or autonomous entities. For instance, Tatarstan paid 93 million roubles and received 38 billion roubles from the centre. Chechnya, Irkutsk, Dagestan, among others fall into the same category.[6] This distribution has led to outcries from provinces.

The *ad hoc* political situation in Russia led to uncertainty amongst provinces. They started taking steps to strengthen themselves. Thus Irkutsk province and Krasnoyarsk territory passed a resolution to unite to form a single republic.[7] Norilsk industrial region demanded that they join the Taimyr region, and initiatives were made to form the central Siberian republic. In Sverdlovsk and Vologda province local soviets declared themselves the Urals republic.[8] Vladivostok and the Maritime territory expressed the desire to form the Maritime republic. Chita province demanded republic status, and other such demands followed.[9]

These moves were made by the provinces to provide a powerful counterbalance to the republics. These had the backing not only of the provincial elites but also of the highest executive authority. For instance, Sverdlovsk's decision to form a Urals republic (July 1, 1993) initially received a favourable response from Yeltsin and prime minister Chernomyrdin,[10] but was later dubbed as untimely. Since the Constitutional Commission wanted the Russian federation to continue to follow the nationality pattern, different provinces wanted to ensure their rights.

The moves made by provinces for changing their borders and enhancing their status was due to a number of factors. The provinces wanted to resist efforts by Moscow to impose disadvantageous contracts on them. The centre's changing positions and the dispute between the parliament and president increased instability, and decisions were *ad hoc* and unpredictable. The provinces were dissatisfied with the Federal Treaty and the 'asymmetrical model' of the federal structure, which did not give them equality with the republics. They had varied perceptions of economic transformation and wanted to be equal partners in the redivision of property. V Novikov, chairman of Krasnoyarsk territory soviet stated, "The constitutional redistribution of material and financial resources (were) in favour of the republics. After all, if the republics receive the status of sovereign states, they will become the owners of land, natural resources, etc..." This reflected the deep concern of the provinces and their determination to 'fight

to the end' to ensure equality in the new constitution.

Constitution and Regional Question

The regional question and distribution of powers were a major barrier in the making of a constitution. The parliamentary draft constitution of 1991 was not accepted because the republics did not want provinces to have equal rights with them.[11] (The president also wanted more powers than granted in this draft.)

The president's decision to present his own draft in April 1993 ran into trouble. This draft was criticised by the republics on the grounds that though the Federal Treaty had been included into it, the constitution did not stipulate either the legal status of republics as sovereign states or the voluntary nature of the federation. The republics criticised the lack of an article on the right to self-determination and felt that articles of the constitution contradicted the Federal Treaty.[12]

Russian provinces too reacted to the president's draft constitution. Representatives of 40 territories stated that they would sign the draft constitution only if: (i) Russia was established as a constitutional federation; (ii) the status of members of the federation was equal, with certain exceptions established by the constitution; (iii) exclusive and joint jurisdiction of the units was equal; (iv) members did not have the right to secede; (v) budgetary structure was included in the constitution as an independent chapter; and (vi) the upper house of parliament was to be elected independently on the basis of uniform norms. The provinces made it clear that they opposed the position of republics as 'sovereign states' since it implied "constitutional redistribution of resources in favour of the republics".[13]

President Yeltsin's susceptibility to pressure, and his method of playing off one group against another led to this wrangling over the constitution. The second constitution draft presented by him in June 1993 mixed contrary ideas. A 'constitutional federation' and a 'treaty-based federation' were fitted together. This draft offered the republics the right of 'sovereign states' and the provinces and autonomies the right of "state-territorial formations".[14] It confirmed the existence of a two-level hierarchy within the federation, yet promised "equality among themselves" for all members in their relation with federal bodies of power. Similarly, the draft stated that "republics may establish their own citizenship" but also made citizenship "uniform and equal" (Article 6).

The impact of the republics' pressure on the draft was acknowledged by Alexander M Yakovlev, a prominent architect of the draft, who said that the decision of granting the republics the right to conclude additional treaties (Article 75) was a verbatim reproduction of a proposal by the Tatarstan delegation.[15]

Clearly, then, the difficulty in adopting a constitution because of the disputes between the federating units and with the centre, along with the opposition to the draft by the parliament, provided an input into Yeltsin's decision to dissolve parliament and assume emergency powers. It was evident to the presidential team that a constitution and a federation had to be imposed on the units to form the Russian state.[16]

The new constitution published by the president on November 10, 1993, and placed for the December elections, like the earlier presidential drafts, reflects the current shifting political situation, without considering the future of the federation.[17] The constitution serves one of the antagonistic political forces in Russian society—that represented by the president. Though representatives of republics and provinces participated in its drafting, the constitution was not a collective effort based on a constituent assembly. The new constitution is thus not a document which represents consensus in a highly divided society.

The president's antagonism with the vice-president and the earlier parliament is reflected in the fact that the constitution envisages no position of vice-president or speaker, but establishes a regime of personal power by the president. The province-republic conflict is represented in the contradictory articles on distribution of power, where various groups are appeased.

For instance, federal state property and its management are under the jurisdiction of the Russian federation. But the possession, use, and disposal of land, subsoil resources, water and natural resources, and demarcation of state property, are under the joint jurisdiction of the Russian federation and the members of the federation. This provision is ambiguous and leaves room for endless disputes. The method of solution of disputes is not clear. The right to secession has not been granted, and several social and economic rights which had been granted by earlier regimes have been taken away. Several republics and regions are clearly dissatisfied with the constitution. During the December 1993 referendum, the republics of Khakassia, Bashkortastan, Chuvashia, Komi, Buryata, Dagestan, and Kabarda Balkaria, did not approve of the constitution. They were joined in their dissent by regions like Lipetsk, Perm, Penza, Rostov, Ulyanovsk, Tambov, Belgograd, and Bryansk.

The inability to provide institutions, including a constitution which would assist in the formation of a stable political system, implies that even this new constitution would be a transitory and temporary document. Since the constitution does not reflect the demand of all the federating units, and the constitution-makers have not been able to arrive at a consensus, discord between the members and the centre will occur frequently. This would lead to negative regionalisation and separatist movements.

Regional Elite Structures

A regional elite with control over local power structures has formed in the Russian regions. This elite is a mix between the old nomenklatura and some new radical leadership. In several instances the radical leadership includes officials who served under the old regime but have now distanced themselves from it. The 1989 elections to parliament led to an unexpected defeat of the party leadership at regional level. Most of the new leadership was in favour of the reforms.[18] This leadership maintained some links with the old nomenklatura, especially since they lacked administrative skills.[19] Since the economic shock therapy programme failed to reverse economic decline, much of the regional elite changed their position *vis-a-vis* economic reform. The local elections of March 1990 witnessed a different trend and communists made political gains in some regions.[20]

Elite formation and consolidation is revealed by the 1993 elections to the Federal Council and State Duma. In the Federal Council, of the 172 deputies elected from the two-seat electoral districts, 115 have held leading positions in the regional administration. Twenty-four deputies are directors of joint-stock companies, and about 18 are professionals (physicians, heads of newspapers, rectors, professors). Only eight did not earlier hold positions in the official or elite hierarchy.[21]

Similarly, of the 219 deputies elected in the 225 single-seat constituencies for the State Duma, about 80 have held leading positions in either the central or local administration. Fifty are directors of joint-stock companies or chief of banks, 15 are directors of state or collective farms, and 40 belong to academic or cultural institutions. Thus only seven unemployed individuals without previous official positions and only two from working class background (one bus driver and one trade unionist) have been elected.[22] Most deputies (94 per cent) have received higher education and are males (87 per cent).

The 225 deputies from the party list include leading party workers, but also state and local officials who have affiliated themselves to the winning parties. Thus a majority of the deputies to parliament belong to a fairly entrenched elite, whose positions of power extend back to the earlier regimes. Election results indicate the consolidation of a professional elite. Regions and republics have elected local leaders and high-powered state officials.

Trends in Regional Politics

The consolidation of the regional elite structure has had an impact on regional politics. The regions have begun to show definite political

choices. Some regions have supported Yeltsin's policies and leadership. Others have systematically opposed him. There is a trend in some regions to become 'oppositionist' regions. While their political choices vary, most regions have started taking independent initiatives at the local level.

An indication of the changing political choices of regions was evident in the April 1993 referendum. In this referendum Yeltsin did not receive a majority of the votes from 10 republics (Adygeya, Bashkortostan, Altai, Dagestan, Ingushetia, Karachayevo-Cherkessia, etc). He was supported by a two-thirds majority in Moscow, and most of the provinces beyond the Urals, except five (Altai, Amur, Chita, Aga Buryat, and Ust-Orda Buryat). In European Russia, only 12 provinces did not express confidence in Yeltsin, mainly from the Black Earth region. Several provinces voted for Yeltsin but not for his social and economic policies (Buryatia, Udmurtia, Krasnador, Stavropol, Volgograd, Voronezh, Kalyga, Kemerovo, Kostroma, Kurgan, Novosibirsk, Omsk, Orenburg and Tver).[23]

This referendum revealed regional block-voting patterns. Regions and republics classified as 'poor' areas generally voted against Yeltsin. Regions with large military-industrial sectors opposed the president's economic and social policies. Ethnic causes also affected voting choices. Moreover, lobbying had preceded voting, with both Yeltsin and Khasbulatov making appeals to regional heads.[24]

This trend is an important indicator of regional politics, because during the 1991 coup and Soviet disintegration, most regional leaders remained neutral. In the crisis situations at the centre the regions initially tried to keep a distance. But at the same time, they sought to capitalise on the weakening state-power by assuming more local power. This was possible because of legal ambiguity on the division of powers.

Independent political initiatives at the regional level were taken by specific provinces in April 1993. Since the Congress of Russian People's Deputies did not extend the president's rights to appoint chief administrators, several provinces held elections for the post. In many of these provinces, people supported by the communists came into power. (For instance in Orel, Krasnoyarsk, Bryansk, Chelyabinsk, Kursk, Lipetsk, and Penza.) In others, independent reform-minded but centrist leaders were elected.[25] With this development the presidential vertical chain of command was broken, though in January 1993 the president had issued a decree granting major powers to the presidential representatives at local levels, thus striking a blow to the powers of the local Soviets and administrators.[26] But with these elections, new power structures opposing the president were again positioning themselves at the helm of affairs.

Yeltsin's aides stated that the aim of these local elections was "to paralyse the system of presidential authority and destroy the executive chain of commands".[27] These political initiatives came from the regions because Yeltsin failed to develop a political party with linkages to the regions. Only the communists still retained linkages at grass roots level.

Instead of re-establishing linkages with regions, Yeltsin sought a further end to these political articulations by imposing emergency, dismissing local Soviets and appointing his own representatives as chief administrators. Twenty-seven regions demanded that the president revoke the September 21 emergency decree. They asked for elections to the parliament and for the presidency. They demanded an end to censorship and threatened to levy counter-pressure by reserving the right to apply economic and political sanctions if their demands were not met.[28] The president's advisors dismissed this demand since it came from the less influential regions (Novosobirsk, Karelia, Tuva and others). This issue hardened the 'oppositionist' trend in some regions.

The impact of Yeltsin's political and economic policies, and the growing regionalisation showed up in the December 1993 elections to the State Duma and Federal Council. In the State Duma of the 450 deputies, 225 were to be directly elected through single-seat electoral districts. The rest of the 225 deputies were to be elected on the basis of proportional representation, through federation-wide electoral districts. In the elections, six electoral districts in Tatarstan and Chechnya boycotted the poll. Thus only 219 deputies were directly elected (see the table).

The result showed trends in regional voting. For example, Vladimir Zhironovsky's Liberal Democratic Party of Russia (LDPR) performed well in central Russia, gaining in Smolensk, Tambov, Orlov and Ryazan (between 30 and 34 per cent of the votes), while Russia's Choice received a high percentage of votes in the northern regions such as Moscow (37.22 per cent), St Petersburg (26.25 per cent), Perm (25.79 per cent), Sverdlovsk (23.95 per cent), and Arkhangelsk (22.51 per cent). The communists received the highest votes in many of the republics like Dagestan, Kabarda, Balkaria, Bashkortostan, Buryata, etc.

Interestingly, however, many regions which voted for the LDPR in the federation list, did not vote for their candidates in the direct election. As a consequence even though it received 22.29 per cent of the votes, only five of its candidates got directly elected. (Many communists or Agrarian Party members won here, for example, in Pskov, Smolensk, Kursk, Novosobirsk, Omsk, etc) (see the table).

This would indicate that the LDPR vote was not entirely a positive vote for Zhironovsky's politics but a negative or opposition vote against Yeltsin. The vote indicates that Yeltsin needs to correct his policies towards the regions, rather than appeal to overt ultra-nationalist sentiments.

A telling statement of the elections is the fact that the largest number of directly elected deputies (126) are not affiliated to any party at all. Party leaders account for only 5 per cent (22) and regional party leaders for only 7.2 per cent (32) of the deputies.[29] This indicates a political culture in which political parties as institutions of interest aggregation and mobilisation have not yet been able to receive legitimacy in the changed circumstances. This also reveals the failure of the parties in building links with the regions or even with the regional elite.

The impact of regional politics will be felt in the State Duma. A new group, New Regional Politics, has been registered, under the chairmanship of V Medvidev. The group claims 65 members, and its purpose is to lobby for the regions.[30] It is evident that regional alliances will have the power to influence decisions in parliament and bring regional issues to the country's attention.

Yeltsin has had to revise his policy and tactics to accommodate the new pressures after the elections. The resignation of

TABLE : RESULT OF THE DECEMBER 1993 ELECTIONS TO STATE DUMA

Political Party	Per Cent of Vote in Federation Wide Electoral Districts	No of Seats by Federal List (225 Seats)	No of Direct Single-Seat Electoral Districts (225 Seats of Which 219 Elected)
Liberal Democratic Party (LDP)	22.79	59	5
Russia's Choice	15.38	40	16
Communist Party of Russian Federation	12.35	32	16
Agrarian Party of Russia	7.9	21	11
Yavlinsky-Boldyrev Lukin	7.9	20	2

Y Gaidar and Boris Fyodorov was a consequence of this. Yeltsin is saddled with a parliament which has elements of continuity with the one he dismissed summarily under emergency conditions. Most of the new deputies are committed to slower economic reform, a larger role for the state, and social support in the form of continuation of select subsidies. The new parliament, despite the constitution, is thus capable of confronting Yeltsin on economic, social and regional issues.

Regionalisation and Economic Reforms

The reform process, privatisation and their impact has varied from region to region. The division of property initiated by the centre has led to a scramble for resources in the regions.

Reviews of privatisation show that some industries have been privatised much more than others. For instance, in the first half of 1993, 22,000 enterprises had been privatised, a five-fold increase over 1992. Public catering and consumer services comprised 69 per cent of privatisation. Light industry and construction comprised 9 per cent, construction material 2 per cent and agriculture 2 per cent.[31] This meant that given the concentrated nature of Soviet industry, some regions, especially urban ones, witnessed quick privatisation, whereas rural areas remained within the old system. Thus areas like St Petersburg, Moscow, Rostov, Sverdlovsk, Krasnodar and Stavropol Krays had each privatised 700-850 enterprises (in early 1993), whereas regions like Tatarstan, Kalmykia, Aygen, Altay and others had privatised less than 50 per cent enterprises. This uneven manner of privatisation is leading to lopsided development. While this is a feature of capitalist growth, the Soviet economy had tried to develop all regions to some basic level.

The method used for privatisation has further exacerbated uneven development. Enterprises have to be privatised by converting the shares of enterprises into joint-stock ownership through three options. The first is open subscriptions. The second option allows work collectives to retain the controlling share of stock; and the third involves the restructuring of the enterprise. Eighty per cent of the enterprises opted for the second option, 5 per cent for the first and only 2 per cent for the third.[32]

That most enterprises, especially those based in the republics and provinces, opt for retaining the controlling share of enterprise stocks was not intended by the privatisers. Because in this case profits are used to raise wages, not to pay dividends. Prices rather than productivity levels rise. Besides, corporate restructuring requires rationalisation. This has generally not occurred in the cases of workers' control.

The voucher-based auctions of properties further distorted the value of industry. For instance, from January 1992 to January 1993, prices rose by 2,500 per cent, but the nominal values of industrial enterprises remained frozen. Thus, though municipal property (housing, shops, taxis, restaurants, etc) was privatised for cash auctions at market value, privatisation of large and medium state enterprises in contrast was restricted to voucher sales. (Each of Russia's 148.7 million citizens received vouchers worth 10,000 roubles as start up capital). The market values of vouchers did not emerge. So, small shops sold for more than large industrial concerns.[33]

Further, parliament and executive policies lowered or increased values of vouchers. For instance, the parliament's decision to counter the presidential decree 'On additional measure on privatisation' of July 1993, brought down the exchange rate of the privatisation voucher. Some decrees by the president increased their rate. These policies benefited the shadow transnational financial groups, which bought up vouchers 'for a song'.[34] This meant local residents would be deprived of shares, which were cornered by outside interests or 'travelling commercial structures'.

These economic policies have led to great price variations between commodities but also between regions. Prices in cities are much higher than those in the provinces.[35] There are also large differences in unemployment patterns amongst regions. Unemployment was higher where privatisation was faster and in areas where defence industries exist.[36]

With regional disparities 'rich' and 'poor' regions have emerged in Russia. Geographically, there are bound to be such regions in every country. But the Soviet regional policy had been one of assisting even development and transferring resources to backward regions, even though this policy was not cost-effective and had its own problems. Now, areas with relatively high and others with low levels of nominal income have developed.[37]

This differential depends on the kind of enterprises located in regions and on the regional authorities' policy in the spheres of employment, income, price control, or the kind of local intervention. Studies show that the gap between the average per capita income of the population of the 'rich' and 'poor' areas has widened noticeably, from 3.2 times in January 1992 to 4.9 times in December 1992. Besides, 56 of Russia's regions had a per capita income below the average for the federation. Groups with the lowest income include Chechnya, Ingushetia, Marie-El, Dagestan, Ossetia, Moscow Province and others.[38] The poor regions have a high percentage of rural residents, a high unemployment rate and 30 per cent more pensioners.

Another regional policy which has led to regional variation and dissatisfaction has been the distribution of subsidies. Analysts from provinces have stated that federal subsidies have been used as a means of political support or payment for political support, rather than based on a region's necessities. Thus the high subsidies to areas like Tatarstan, Bashkortastan, Sakha, and Chechen, have been viewed as 'bribes'.[39] Moreover, economic and social logic does not determine distribution of federal subsidies.[40] Federal budget tax collection and redistribution has shown 'nationality based privilege'. Resentment between regions and republics has thus been aggravated.

These regional policies have instilled fear and caution amongst regional elites. This led to a resolve amongst local leaders to intervene in economic activity and decision-making. This intervention which has been going on since 1991 has increased since then. Thus local authorities have imposed barriers to the movement of goods, introduced export licences on local products and have taken measures for protecting regions. For instance, in late 1991 Karelia and Stavropol imposed controls on staple deliveries to other regions.[41] Vologda imposed 100 per cent tax on sales of timber across its boundaries,[42] and Krasnoyarsk levied similar taxes.

Some provinces adopted a cautious approach and suspended privatisation under various pretexts. For instance, Primoskiy Kray held up voucher auctions, because of a slump in production. Novosibirsk and Chelyabinsk provinces suspended property auctions claiming that the travelling commercial structures would buy up shares in local enterprises.[43] (Here 60 per cent of all trade and services were privatised. Of these 55 per cent were bought up by labour collectives.)

Analysis of privatisation in Chelyabinsk showed that the travelling businessmen from Moscow and Kazan with 'bagsful of vouchers' bought up shares totalling 6 per cent of the start up capital of enterprises. As a result 2.5 million residents of the Chelybinsk defence sector enterprises were cut off from cheque-based auctions.[44] In defence of the State Property Committee, the military-industrial lobby in the region prohibited the defence-sector enterprises from being turned into joint-stock companies. The centre intervened and Anatoly Chubais, the minister in charge of privatisation, fought against the trend initiated in Chelyabinsk. Clearly the dispute over privatisation had its impact in the provinces.

Besides the Chelyabinsk's example, provinces facing financial difficulties have been resorting to individual remedies. For instance, Samara Oblast suspended budget payment to the centre and used the amount to pay for grain purchases, until such time the central authorities remedied this problem.[45] Thirty-eight regions threatened to suspend payments to the federal authorities unless the finance ministry settled its accounts.[46] Siberian territories have

developed a common foreign economic policy co-ordinating foreign economic activity.[47] Most regions are arguing for greater autonomy and control of resources.

Clearly, the uncertainties over the constitution, the question of privatisation of vast resources, contracting economies and increasing unemployment have fuelled resentments in the provinces. There is special resentment on the absence of any effective regional policy that would ameliorate costs and prices. This has led to province/regional elites seeking greater control over their own affairs.

While there is a fear of autarky, it is also a fact that a politically viable diversification of the economy can only be based on greater regional control over their own natural resources, marketisation, etc. It is evident that the regions will have to create conditions for accumulation to finance their own economic projects. This aspect of regional autonomy would have to be encouraged rather than curbed.

Conclusion

Regional variations in political power and economic structures in Russia led to struggles over power and control of resources. The centre's regional policy consisted mainly of controlling the budget, and allocating sums to territories as part of political pressure and patronage. The centre has also used disputes between republics and provinces to play off these competing territories against each other. This policy has led to regions using different tactics to pressurise the centre. Another consequence of the policy has been uneven sectoral change and uneven development. Russia is thus getting divided into rich and poor regions. At the same time, most political parties, including the democrats supporting Yeltsin, have not built regional links or grass roots movements. Only the communist party and the old nomenklatura have links at the provincial level. A varied regional elite has emerged, consisting of some new reform-oriented groups, and others linked to the old nomenklatura. Some regions thus support the president's social and economic policies, whereas others have emerged as 'oppositionist' regions. Most regions, however, have been taking steps independent of the centre, especially on local issues. This isolated resolution of problems is attempted because of the jurisdictional confusion over division of powers. The need for regional power elites to safeguard their constituencies from sharp socio-economic decline and to maintain themselves in power has led to great negative regionalisation. This approach is driven by an instinct for survival both by the republics and regional elites.

Linkages between the regional elite and social groups obviously exist but have not yet been adequately studied. Contradictions amongst emerging classes and between elites is evident in local and national elections and debates on privatisation.

The new constitution instituted by Yeltsin does not remedy the problem of disputes between regions and the centre, and will increase regional differentiation. By adopting emergency measures and ignoring the regions, Yeltsin in many instances curbed the nascent democratisation and autonomy movements there. The impact of these moves became evident in the 1993 elections where a large number of regions and republics opposed Yeltsin. Decentralisation is essential for transition and the regions have been playing an increasing and important role towards this. Yeltsin's policies and the new constitution do not provide for this decentralisation.

It is, however, clear that only those institutions and structures which are supported by Russia's regions and regional elite will be effective. The Russian federation will have to be built from below, based on consensus and grass roots democracy. Presidential decrees and referendums are no substitute.

Conquest of Self?

Intimacy and Overcoming of Boundaries

Ananta Giri

The Transformation of Intimacy: Sexuality, Love and Eroticism in Modern Societies by Anthony Giddens; Polity Press, Cambridge, 1992.

> Sexuality and reproduction in the past structured one another... when directly bound up with reproduction, sexuality was a medium of transcendence. Sexual activity forged a tie with the finitude of the individual, and at the same time carried the promise of its irrelevance; for seen in relation to a cycle of generations the individual life was part of a more embracing symbolic order. Sexuality for us still carries an echo of the transcendent. Yet given that such is the case, it is bound to be surrounded with an aura of nostalgia and civilisation. A sexually addicted civilisation is one where death has become stripped of meaning; life politics at this point implies a renewal of spirituality.
>
> —Anthony Giddens[1]

> Human Society is a ceaseless growth, an unfoldment in terms of spirituality. If so, it must be based on ever increasing demand upon the restraint of the flesh. . Above all, a life of restraint presupposes an intense loving desire for reunion with god
>
> —M K Gandhi[2]

> A closed government is bounded in a way that the self is supposed to be bounded and undisclosed in the individualist model of unethical freedom that permits us to victimise, appropriating and acquiring power of wealth behind our boundaries, without disclosing and assuming relational responsibility...
>
> —Michael Ryan[3]

I

COMMENTING upon the sexual revolution taking place in American society, Pritrim Sorokin had written in 1956: "Since the 'marriage-family', school increasingly fails to graduate well-adjusted individuals and since there seems to be no other agency which can better discharge this task, tne nation, and mankind at large, is bound to be made up more and more of individuals less and less capable of getting along with others... Charity or love begins at home, at the cradle of the helpless baby. If there is no baby, no cradle, there can be no loving and caring parents."[4] Anthony Giddens' *The Transformation of Intimacy*, which comments upon the same American condition but in its later phase of development, provides us not only a different—an affirmative—answer to the naggihg doubts Sorok in had raised but also a different meaning of the elementary terms of conversation such as home, family and marriage. Giddens shows in this engaging book how changes taking place in the realm of intimate relations in American society in particular and western societies in general have broken asunder the supposed teleological unity among sexuality, marriage and reproduction. Recent developments in sexual relations, for Giddens, show that it is possible to get along with each other in companionate marriage, while fighting with each other in heterosexual marriages, and nurture each other without having the need of the opposite sex and having a child as a medium.

Basing upon the ethnographic observation of men and women, and boys and girls, carried out by researchers such as Lilien Rubin and others, Giddens argues: "Hetero sexual marriage superficially appears to retain its central position in the social order, making the prior discussion of lesbian relationships at best rather marginal. In reality, it has been largely undermined by the rise of the pure relationship and plastic sexuality".[5] For Giddens, "Plastic sexuality is decentred sexuality, freed from the needs of reproduction... it frees sexuality from the rule of the phallus, from the overwhelming importance of male sexual experience."[6] This is manifested in gay, lesbian as well as in heterosexual relation where sexuality is an act of intimacy in itself, is not tied to reproduction and is not servant of an imposing long-term commitment. It goes hand in hand with the rise of "pure relationships" in the realm of sexual intimacy where one enters inside a relationship as an autonomous and free individual, without any constraint. Pure relationship does not presuppose sexual purity—in fact it considers this as a liability—and is capable of accommodating multiple sexual relationships. Giddens calls it episodic sexuality. In his words:

> A pure relationship has nothing to do with sexual purity, and is a limiting concept rather than only a descriptive one. It refers to a situation where a social relation is entered into for its own sake, for what can be derived by each person from a sustained association with another, and which is continued only insofar as it is thought by both parties to deliver enough satisfactions for each individual to stay within it. Love used to be tied to sexuality through marriage, but now these are connected more and more via the pure relationship...The pure relationship, to repeat, is part of a generic restructuring of intimacy. It emerges in other contexts of sexuality besides heterosexual marriage, it is in some casually related ways parallel to the development of plastic sexuality.[7]

Episodic sexuality earlier was the preserve of the males. Giddens argues that recent developments in the sphere of intimate relations show that girls have reconquered this exclusive male privilege. In fact, the significance of Giddens' present work lies in bringing to the core of the discussion the sexual experiments of the girls in the recent times. The bad/good girl distinction is not total any longer and girls feel that "they have an entitlement to engage in sexual activity, including sexual intercourse, at whatever age seems appropriate to them". Girls now do not have "to fight to achieve sexual freedom: such freedom exists, and the problem is to make something of it in the face of male attitudes which still carry more than an echo of the past. The girls therefore emerge as the main social experimenters."[8]

But when girls pursue sexual experimentation, it is no longer a reiteration of the earlier male "romantic lover" but is a pursuit of what Giddens calls "confluent love". While "in romantic love attachments, the element of sublime love tends to predominate over sexual ardour",[9] confluent love is contingent in which a person's sexuality "has to be negotiated as part of a relationship."[10]

For Giddens, in the transformation of intimacy underway in Europe and North America, both lesbian and gay relationships are examples of reflexive sexuality—"sexuality as a quality or property of the self".[11] But in this transformation of intimacy there has been a transmutation of the biological categories of male and female, including the transmutation of phallus into "mere penis".[12] While this transmutation has made sexuality "torn between assertive sexual dependence, including the use of violence, on the one hand, and constant anxieties abut potency on the other",[13] in the case of women it has certainly led to liberation. According to Giddens, "Women can now see men, at least on a cognitive level, as just as much a functionless appendage as the male sexual organ itself."[14]

II

Giddens describes for us both the limits and possibilities in the rise of such plastic sexuality. The limits are mainly the problems of compulsive sexuality and pathological co-dependency. With the public legitimation of lesbian relationships and sexual freedom, the sexual addiction of girls has come to the

force. But Giddens offers a normative criticism of sexual addiction, whether it is in the male or in the female, by arguing that it is a "defensive reaction" and a "negative index of the degree to which the reflexive project of the self moves to centre-stage of late modernity."[15] Sexual addiction is a form of "compulsive behaviour" where the "integrity of the self as a whole is menaced."[16] The same problem of "reverse reflexivity" is also at work in the rise of co-dependency in the field of emergent plastic sexuality. A co-dependent is someone who is dependent upon another person for his or her definition and "cannot feel self-confident without being devoted to the needs of others".[17] "Lack of self esteem", primarily because of abusive parentage, is a primary reason for co-dependency and therefore co-dependent persons are advised to "heal the child within".[18]

The promise in contemporary changes in intimate relations lies in the germs of a "non-repressive" society that it carries within itself. It is also a harbinger of a companionate marriage where marriage is used as a home base by both partners who have "only a slight emotional investment" in each other.[19] The rise of free and non-coercive engagement in sexuality is an index of "revolutionary processes, already underway in the infrastructure of personal life", which press for "psychic as well as social change".[20] Transformation of intimacy carries with it the promise of a "democratic personal order" not only in the area of sexuality but also in those of parent-child relations, and other forms of kinship and friendship.[21] According to Giddens, "the prohibition of violence" and "avoidance of emotional abuse" are continuing challenges that current transformation has to face.

Though Giddens locates the transformation in intimacy in social and cultural tran-sformations taking place in the recent past, he does not agree with the Foucauldian account of the history of modern sexuality. For Giddens, *contra* Foucault, modern preoccupation with sex has not been set by the regime of power and its origins are not merely institutional; rather its origin lies in the reflexive project of the self—a project helped but not exhausted by changes in reproductive technologies. Giddens argues that to explain changes in sexuality "we have to move away from an overwhelming emphasis on discourse".[22] For him, "...sexuality has the importance for us today that it does, not because of its significance for the control systems of modernity, but because it is a point of connection between two other processes: the sequestration of experience and transformation of intimacy".[23]

III

Giddens traces the emergence of an "ethical framework for the fostering of non-destructive emotion" in individual and communal life in the non-coercive intimate sexual relations underway in our times.[24] Such intimate relations provide for the "possibilities of a revitalising of the erotic" through mutuality rather than through unequal power.[25] Giddens has also brought the autonomy of individual action to the centre of intimacy, but he leaves unanswered the question of negotiation between autonomy and mutuality. In his quick characterisation of all co-dependent relations as pathological, Giddens argues that "defining personal boundaries is regarded as fundamental for a nonaddictive relationship".[26] For him boundaries "counter the effect of projective identification".[27] But without the overcoming of boundaries, is real love, any love for that matter, possible? Giddens privileges personal boundaries, thus reiterating the vocabulary of possessive individualism which is in urgent need of transformation.[28] Therefore, he can uncritically accept the current therapeutic labelling of co-dependency as pathological. If co-dependency also means being dependent on the other and giving love to a partner despite felt abuses, then why should it be viewed as pathological? If the task of sociological engagement is also to subject the dominant style of thinking to a critical scrutiny by bringing in different accounts of non-institutional styles of self-reflexion, then is it not important for Giddens, who is interested in reflexive mobilisation of self, to explore different alternatives possible within a labelled type? After all, what is the meaning of self-confidence when one is part of a relationship? This exploration would help us raise further questions to the contemporary discourse rather than just celebrate it, such as: Is it not a challenge for pure relationship to erase the distinction between self and non-self?[29] With a view of intimacy based upon inviolable boundaries and self-confidence, how do we come to terms with the view that love makes us vulnerable rather than powerful?

In this account of transformation of intimacy Giddens himself points out the contradictions in pure relationship. He shows us the tension existing even in lesbian relationships because of promiscuity and the use of violence in such relationships. Therefore on the part of women, lesbian sexuality can be looked upon as a step towards more democratic sex but can not be treated as an end in itself. Giddens himself speaks of the "return of the phallus" in some of the sexual activities lesbians are engaged in such as hair pulling and beating. Here, along with the challenge of overcoming of boundaries, there is also the challenge of overcoming one's ego. Children, females, males—all have ego, and the distortions ego can bring to the work of a "pure relationship" are enormous. Though modern feminist scholarship has looked at the problem of gender at the conjunction of race and class, it has by and large left the problem of ego untouched.[30] However, whether we speak of intimacy or democracy or intimacy as democracy, the next battles are to be fought *vis-a-vis* the problem of ego. Overcoming one's egoistic boundaries certainly constitutes an arena of "life politics", which is concerned with generativity rather than distributive power, in Giddens' sense.[31]

Giddens looks at the transformation of intimacy as an instance of both institutional reflexivity and self-reflexivity. But though he is very good in showing the reflexivity of the self *vis-a-vis* modern institutions, he does not provide the account of reflexivity of the self *vis-a-vis* itself. What is the nature of the self and what place intimacy and sexuality have got in its total scheme of things—its scheme of being and becoming? How does a sexual engagement relate to the seeking of meaning of the self in other engagements? At what point does sexuality itself become an addiction to be distantiated from in the meditation of the self? The meditation of self, according to Charles Taylor, involves discovering and realising a "set of qualitative distinctions".[32] Lately, even political scientists have started speaking of higher desire and lower desire—the "inner conflict between what the individuals themselves experience as their more desirable and less desirable desires".[33] I am not arguing that sexual engagement is an instance of lower desire, but does a reflexive mobilisation of the self come to term with such questions at all at any point? Writing of sexual over-indulgence, Sorokin had argued: "... over-indulgence of sex urge tends to undermine the physical and mental health and vitality of the individual, destroys his sense of morality, diminishes his creative energy?"[34] One can certainly disagree with Sorokin's assertion, but does a reflexive self at all confront such questions in its sojourn? Does a reflexive self totally discount what Sorokin calls "the possibility of transmuting an unsatisfied sexual drive into a form of creative achievement?"[35] These questions inevitably bring us to the issue of nature of the self—its sources, and its manifold aspirations. Though Giddens had told us in his *Constitution of Society*[36] that he is more interested in questions of ontology than epistemology, he does not really probe into ontological questions such as the nature of the self and culture.[37] Without a deeper reflection on the nature of the self, it is no wonder that Giddens can only work with the visible boundaries of the self.

Of many contradictions in pure relationships that Giddens talks of, what is conspicuous by its absence is the question of purity of action and intention in a relationship. Giddens says that a pure relationship can accommodate multiple

episodic sexual encounters. But he himself admits that such multiple sexual encounters bring tensions to a relationship. A processal analysis of resolution of such tensions would have made Giddens grapple with the question of purity of action and intention of actors rather than dismiss it as a non-issue. Giddens says that confluent love can revive the "aesthetic qualities" of actors as participants of sexual activity.[38] But does this aesthetic experience not have at least the potential to make actors reflexive about "eroticism as cultivation of feeling, expressed through bodily sensation"[39] and use it as a basis for a transcendent spiritual realisation? In other words, does not sexual pleasure, beginning with the denudation of the body, in its aesthetic turn end with its cultural and spiritual adornment?[40] Do these moments of aesthetic realisation not initiate a process of reflection within actors to purify their instruments of pleasure? If the kind of changes that Giddens is describing are a step to future, then the issue of purification of intention and action cannot be dismissed totally.

The delinking of sexuality from reproduction is probably the most important feature of the transformation of intimacy that Giddens talks about. He makes a reference to contraception and other reproductive technologies in this regard. He looks at this delinking in the context of technological changes as well as of shifting mentalities. But he takes for granted the non-contentious articulation of this delinking as offered by the dominant discourse. In the American heartland itself, a serious ideological battle has been going on around the issue of abortion where the participants are not only those women who celebrate the freedom of sexuality from reproduction, but also women in pro-life movements who have consistently questioned the delinking of sexuality from re-production. In fact, they have offered a cultural critique of such delinking. Faye Ginsburg's engaging ethnography of the abortion debate presents the voices of some such critics of contemporary culture of sexuality.[41] Ginsburg writes about the vision that animates pro-life women in the American community that she studied. Pro-life activists

> accept differences, but not necessarily hierarchy, in the social and biological roles of men and women. Their reform efforts are directed toward creating and promoting a social and political context that they feel will protect and enhance one essential condition that, in general, distinguishes men from women: pregnancy and motherhood. In their view abortion is thus a condensed symbol for the devaluation of motherhood and the central attribute assigned to it in this culture—the self-sacrificing nurturance of dependents.[42]

Ginsburg also tells us how, in their fight against abortion, pro-life activists are fighting against the forces of "materialism and narcissism" that are "displacing the nurturant ties of kin and community" and to "reform the more dehumanising aspects of contemporary capitalist culture".[43] They strive to control destructive male sexuality and transform "raw masculinity" into a nurturant power. They associate abortion with the profit-making motive and liken abortion clinics to "7-11" convenience stores.[44] In their attacks against abortion, they are not only concerned with women and womanliness, gender and sexuality but also with the "self-production of society",[45] and the reproduction of American culture as a whole. In the right-to-life view, abortion comes to signify "not only a withdrawal of unconditional, self-sacrificing nurturance, but the devaluation of culture itself".[46]

The above account of Ginsburg shows that there are still many women in American culture who value motherhood and would like to take responsibility for the foetus that is born of sexual relation.[47] In his earlier work on modernity and self-identity Giddens had told us that reflexive mobilisation of the self, which is not an extension of the control systems of modernity, takes place primarily, though not exclusively, in the field of contemporary social and cultural movements. If he had brought some related social movements, such as the pro-life movement, into the orbit of discussion, he would have encountered a more differentiated ideological landscape, where his uncritically accepted thesis of the delinking of sexuality from reproduction it itself subject to intense ideological criticism.

The genius of Giddens lies in elevating sociological analysis to a level of normative criticism, which is evident from his critique of sexual addiction. I am sure Giddens would be open to the possibility of taking such normative criticism to still greater heights and state along with Robert Bellah and his colleagues: "Attending means to concern ourselves with larger meaning of things in the longer run, rather; than with short-term pay offs. The pursuit of immediate pleasure, or the promise of immediate pleasure, is the essence of distraction. A good society is one in which attention takes precedence over distraction."[48] In his own account, Giddens many times refers to the manifold relationship between spirituality and the emergent plastic sexuality. In fact, one of the concluding lines in his book speaks of the "renewal of spirituality". Therefore, to ask such questions as Can sexuality be a source and field of renewal of spirituality? would not be unfair to Giddens. But to come to terms with such questions, Giddens would have to meditate on the frontiers of spirituality at the present juncture. From *The Class Structure in Advanced Societies*[49] to *The Transformation of Intimacy*, Giddens' career has been a quest of creativity and continuous transgression of boundaries. The next thing we can expect from this remarkable interpreter of our times is a work on spirituality, which is in fact long overdue given his preoccupation with what he himself calls the "transformative capacity of the actors".[50] But for this, Giddens would have to be not only an ethnographer but a spiritual seeker, questioning not only the "post-metaphysical thinking"[51] of the time but also going beyond the rational foundation of modern European philosophy.

Banking for Development

Bhupat M Desai

Banking and Rural Development by H B Shivamaggi; Mittal Publications, New Delhi; pp 254, Rs 290.

H B SHIVAMAGGI has been intimately associated with the development of the organised rural banking for over three decades and has deep interest in agricultural and rural development. He offers a very interesting operational framework free of technical jargons and methods for evolving policies for agricultural development and institutional rural credit. He presents this in two parts consisting of 14 chapters. Nine of these 14 are articles and/or talks by him published elsewhere earlier.

We will review by drawing on his broad framework for factors and policies influencing agricultural and rural development instead of each chapter. Before that it must be stated that the book would have enriched further if (a) more recent literature and data were analysed, (b) functioning of co-operatives and Regional Rural Banks (RRBs) were also analysed, (c) older programmes like SFDA and MFAL were compared with IRDP, and if (d) repetitions in some parts were avoided. Four significant points of the author need stressing are: (a) both efficiency and equity are the objectives of economic development, (b) economic aspects of rural development are very important, (c) agriculture makes important contributions to economic development though development of non-agricultural sector is also critical in itself and also for agricultural and rural development, and (d) rural folks being leisure-loving, risk-avert and tradition-bound require close supervision and motivational measures by developmental and credit agencies; we however think that such attributes are applicable to all Indians or for that matter entire humankind.

Shivamaggi suggests that agricultural development is influenced by technical, organisational, and economic factors although these three overlap and also interact among them. We substitute 'institutional' in place of organisational factor because appropriate organisational structure and processes are also needed even for technological and economic changes, besides institutional change.

The author merely discusses the new inputs in which technical change is embodied. What is very critical is that it is the new knowledge generated by basic agricultural research, engineering and extension system that forms the foundation for new inputs and services. He, however, rightly states that new agricultural technology being scale-neutral and divisible has relaxed the land constraint and has augmented land and labour use.[1] But agricultural unlike industrial production process is highly complementary in nature.[2] Not only HYVs, irrigation or more appropriately water, and fertilisers are complementary but even labour and some form of capital including working capital are complementary for such works as well digging, soil conservation, bunding, etc. These characteristics have highly significant implications for rural financial institutions (RFIs) for their lending and other operations. The discussion on mechanisation is illuminating for it identifies farming operations which need mechanisation that is human labour and land augmenting but bullock-labour saving in nature. Finally, new technology for rainfall dominated semi-arid and arid areas should be not merely resource-centred but also seed-centred. It is not enough to have watershed-based farming for it is the suitable HYVs which act as a major productivity-shifter. Again the complementarity among the inputs including modern hand- and bullock-drawn small implements must be attained for efficient and rapid technological change in rainfed areas. Needless to say that such a change also requires and interacts with institutional and economic changes.

We will restrict to only three types of institutional factors, namely, land tenure, agricultural marketing, and institutional credit. On land tenure unfortunately the author raises the issue of scale of farming more often than warranted in the present context. While we share his concern for high and increasing fragmentation of landholdings we think that the top-most priority to resolve this is for land consolidation policy rather than co-operative/collective farming. This is because former seems to be organisationally and politically more feasible than the latter. For similar reason we also differ on the issue of lowering existing ceilings on land ownership at the current stage of development. But we fully endorse his strong emphasis on proper land laws and records for both land owners and tenants in particular. These are critical for incentives to adoption of new technology and also for facilitating the role of RFIs in this process.

On agricultural marketing three important issues may be commented, namely, marketing defects, role of public, private and co-operative institutions, and institutional finance for marketing. Marketing defects like distress sale, too many intermediaries and their exploitative practices, and price disincentives for perishables have adverse effect on farmers' share in consumers' rupee. Shivamaggi suggests establishment of sub-yards of regulated markets and marketing co-operatives as solutions. While the former is feasible, the latter is unwarranted. Instead, existing primary agricultural co-operative credit societies (PACS) may be facilitated to undertake agricultural produce marketing. Even this alternative is likely to be problematic because of severe competition from private traders. Hence PACS may perform a market intelligence service and act as agents of apex co-operatives like NAFED, and other public agencies. As regards exploitative practices there are contrary evidences. Higher margins are more due to high transportation and other costs. Hence what is required is sub-yards and broad-based transportation and communication network. This alternative is better than the creation of public institutions and monopolies like cotton monopoly procurement scheme

in Maharashtra. This is because of strong comparative advantage of the private sector in agricultural trade. It is perhaps for this reason even co-operatives have not much succeeded especially in non-perishable agricultural commodities. In this context it would be worth studying whether or not, how and where NDDBs vertically integrated co-operatives of oilseeds growers have served their objectives.

Shivamaggi interestingly discusses three types of institutional finance for agricultural marketing. These are finance for traders engaged in agricultural produce marketing (AMS), farmers selling this produce (APS), and dealers selling agricultural inputs (AIS). All these three may be encouraged because they facilitate forward and backward linkages among AMS, APS and AIS. These linkages lead to higher agricultural productivity, production, value added, and incomes of farmers. These types of agricultural finance by RFIs enable them to spread their common transaction costs and reap scale and scope economies for their viability, besides diversifying risks in credit business and portfolio with high as well as low interest bearing loans. Current policy indifference for and/or bias against such agricultural finance must be appropriately corrected.

The discussion of institutional rural credit for farmers' working and term capital needs overemphasises implicitly indicated supervised rural credit policy. Similar is the case about his suggestive consideration of only the rural poor (i e, landless, marginal and small farmers both of whom constitute 76 per cent and operate only 29 per cent of land in mid-1980s) as clients for the RFIs. This is surprising because Shivamaggi is acutely aware of limitations of institutional credit policy for them. But his stress on this policy in a technologically dynamic agriculture is rightly placed. So is the case with his recognition of credit and non-credit functions of RFIs at grass roots level for both agriculture and non-farm activities. These functions are (1) working capital loans (both in cash and kind), (2) term loans, (3) technical services, (4) inputs supplies, (5) marketing of produce, (6) sale of consumer goods, (7) collection of deposits, (8) other borrowings, and (9) loan recovery.[3] While PACS are eminently suitable for most of these, commercial banks and RRBs have a genuine problem in undertaking commodity marketing related functions (4) to (6). But, the earlier discussion of three types of marketing finance is extremely pertinent here. Another mechanism is to co-ordinate with the existing institutions engaged in commodity marketing. Let us not forget that rural India in 1990s is different from what it was in 1950s or earlier. That leaves only one controversial function, i e, technical services. Some of the commercial banks have well organised this through creation of specialised branches, technical service centres for a group of branches, etc. What may further be considered is the organisation of technical staff on a peripatetic basis and improved co-ordination with the government extension and other services, agricultural universities, NABARD, and inputs industries. These decentralised alternatives are likely to be better than Shivamaggi's suggestion of creation of a government-cum-bank's separate institution for technical services. Let us also recognise that diversified and decentralised rural banking entails not only costs but also returns. Moreover, there are evidences of either scale economies or constant returns to scale for RFIs.[4] These can be reaped not only from larger, diversified and multiple operations but also from larger reach or coverage of rural households. In this context a word about group loans may be stated. While such loans would also bring scale economies, they need not be the only and strait-jacket solution. This is because a group can collude to jointly default and can also have a free rider who would create a problem for genuine borrowers. Three additional points on institutional credit may be commented.

First is the suggestion of establishment of multi-purpose rural co-operative banks at tehsil or town levels. It appears to us that this would create many more complexities—social, political, organisational, etc. Instead existing PACS may be developed into a truly multi-purpose co-operatives. This may be done in stages beginning first with vibrant inputs sales operation, besides whatever else they are presently engaged in. For this they would require godown, sustained cash credit facility to buy and stock inputs well ahead of the season, some performance-linked incentives for their staff, and organisation of managing committees into three or four smaller groups to assist the staff. RBI/NABARD, state co-operative banks, and district central co-operative banks may assist in all of these. Such process of transforming PACS would also then not require the functional co-operatives the author advocates. However, such commodity-based co-operatives may be encouraged for perishables but they (as well as oilseeds growers co-operatives) should concentrate only on produce marketing and processing including primary and tertiary in nature.

Secondly, Shivamaggi's suggestion of district credit planning (DCPs) by the Lead Bank together with projectisation of different types of rural term loans combined with core working capital loans by different individual banks is worth implementing. These DCPs may also incorporate the three types of marketing finance discussed earlier, besides agro-processing finance.

Thirdly, paradoxically credit-based poverty alleviation programmes may be viewed with some detached but not indifferent approach especially for the landless. Some carefully designed such agricultural artisan, and other activities for them may be promoted. Moreover, their problem of unemployment and low incomes must be also attacked by concurrent (a) programmes like JRY and Employment Guarantee Scheme, (b) rapid technological change of land and labour augmenting type for other farmers especially medium-sized (2 to 10 hectares who constitute 22 per cent and cultivate as much as 51 per cent of land), and (c) policy-induced decentralised processing industries particularly for foodgrains, oilseeds, sugarcane, dairy-products and horticulture which tend to be labour-intensive and nearer their raw materials.[5] Institutional credit for these last two categories would be extremely crucial.

On economic change three major issues may be discussed. These are agricultural prices, inputs subsidies, and government investment for basic agricultural infrastructure.

Shivamaggi convincingly argues for a cautious approach to agricultural price policy. This is because of its conflicting influences on agricultural production, saving, and investment, industrial development, government saving, and income distribution. He also recognises that increases in procurement prices for pulses and oilseeds have not much encouraged their production. This is because of binding constraint of inadequate adoption and/or availability of appropriate new technology for them. But his suggestion for favourable terms of trade for agriculture overlooks the possibility of sustaining neutral or harmonious relative agricultural prices through guided price mechanism. It is also important to note that farmers are not compelled to sell their produce to the government. Public agencies merely act as

a buyer of the last resort. All these policy initiatives are worth recalling when injudicious increases in procurement prices are announced more often now.

On inputs subsidies the author advocates discontinuation or modification. Latter seems to be preferred because he thinks they are a necessary evil in a welfare state and also because they are better than the produce price support. We concur with the latter and emphasise that the inputs subsidies provide incentives for technological change. Having said this we also suggest that prices of fertilisers, canal irrigation water, and rural electricity must be periodically raised lest farmers get accustomed to the cushion these subsidies provide. Likely adverse impact of this on the demand for these inputs and hence production may be averted by non-price policies. Subsidies on all these three inputs unlike interest rates are budgetary subsidies. We disagree with the author's concept of interest rates on rural credit being a direct financial subsidy. Moreover, we also underscore that interest rate subsidy exists only when real interest rates (i e, nominal rates minus normal inflation rate) are negative. But interestingly these rates on rural credit have remained positive in last two decades or so except for four abnormal years witnessing exogenous oil shocks, droughts, etc. Lastly, the author advocates full remission in loan repayments in place of capital subsidy for IRDP beneficiaries because of difficulties in controlling its end-use, leakages, corruption, etc. However, all of these can be rectified. Moreover, remission in loan repayments would endanger building a sustained, dignified and disciplined relationship among the government, banks and beneficiaries. Such a relationship is crucial for future banking including credit transactions among these actors.

Shivamaggi rightly emphasises government's role in agricultural and rural development. However, he does not pinpoint this in the form of appropriate investment and how has it changed over the past seven five-year plans. What needs emphasis is that government investment in such agricultural infrastructure as research, extension, irrigation, electricity, communication, roads, education, regulated markets, and weather forecasts crowds-in rather than crowds-out private investment by millions of rural households. Both public and private investments for agriculture have a declining trend in 1980s.[6]

Ram Janmabhoomi, Consumer Identity and Image-Based Politics

Arvind Rajagopal

Underlying the adaptation and encroachment of communal discourse within commodity culture is the rise to prominence of mass-mediated images as a centralised locus of social and political discourse, indexed by the recent establishment of national television. With this crucial development emerges a new era of symbolic politics.

THE Indian economy, in a famous quip by economist Raj Krishna, suffered from a 'Hindu rate of growth' for decades after independence—a "sluggish" 3 to 3.5 per cent per annum between 1950 and 1980.[1] Embodied in the phrase is not only the economist's old adage that growth is the chief goal of any economy, but also the self-deprecating characterisation of this failure as 'Hindu'. 'Hindu' here was metonymic of India—ancient and out-of-date, too vast to be successfully influenced by mere mortals, and, possessing in this intractability its own peculiar distinction. Yet the overriding feature of this distinctiveness was failure—its seeming incapacity to answer the needs of changing times. From being considered the glory of an old civilisation, to be 'Hindu' had become the unbudgeable burden of a backward nation attempting to be modern.

Yet in a matter of a few years, the term 'Hindu' performed the equivalent of a semiotic somersault. To be Hindu became a triumphant declaration of strength and vigour, and the symbol of an aggressive culture eager to acquire hegemony. Now it was those who had believed the term to signify anything else who were at fault—they were traitors to a great heritage who, by their unbelief, had paralysed an incomparable civilisation. In a criticism symptomatic of the change, RSS ideologue Jay Dubashi declared, "It was not the Hindu rate of growth that failed India but the Nehru rate of growth and men like Raj Krishna are as much the guilty men as Nehru himself".[2]

In the 1980s, the average annual growth rate was above 5 per cent, thereby "breaking the barrier of the Hindu growth rate", declared a prominent business magazine.[3] "The last 10 years have transformed not only the society and the economy, but also the psyche of the country", it proclaimed. "[R]evered terms of the past are now *passe*: socialism, controls, state interference (*sic*)... One can easily sum up the decade by saying, 'Long live democracy'. Or if one wants to be more specific, 'Long live liberalisation' " (p 50). There is journalistic hyperbole here, but the choice of rhetoric itself is revealing. With the lifting of socialism, or, state interference (the terms slide into each other, as in many such accounts), and the liberalisation this implies, democracy springs forth, and psychic transformation proceeds. From being seen as a burden, events seemed to suggest that 'Hinduism' too was a part of the repressed truth of society, released by the lifting of state controls and the mobilisation of latent popular forces, although those espousing 'Hinduness' insisted that much remained to be done.

Two streams of discourse, on economic liberalisation and 'Hinduisation', respectively, came to prominence in close proximity in the mid-80s, reinforcing each other, but also interrupting and clashing periodically as in the debate over swadeshi vs entry of MNCs, which saw internal dissent in the BJP. The euphoria over liberalisation, the growing assertiveness of its beneficiary classes, and the spread of a consumerist ethos that accompanied these phenomena, created, in fact, new spaces into which communal discourse inserted itself, to the great advantage of the latter. In this paper, I argue that underlying the adaptation and encroachment of communal discourse within commodity culture is the rise to prominence of mass-mediated images as a centralised locus of social and political discourse, indexed by the recent establishment of national television. With this, crucial, development emerges a new era of symbolic politics, one whose consequences this paper makes a limited attempt to explore via the Ram Janmabhoomi campaign.

Market Forces and 'National Culture'

The celebratory rhetoric of radical change Rajiv Gandhi brought in with him to office, fashioned for policies modelled after Reagan and Thatcher, signalled a twinned emphasis on both market forces and 'national culture' in some sense.[4] A reliance on market forces (via 'supply side' policies) meant a reduction of the socio-economic role of the state; individual initiative in the private sector was expected to fulfil this role more efficiently. In effect, this replaced tax revenues with massive public borrowing from market sources to finance the expenditure of the rich, a policy which in India led eventually to a negative balance in net reserves during June and September 1991.[5] In the US and UK, the reactionary character of these economic policies was complemented by a celebration of national heritage—involving an affirmation of racist and imperialist attitudes and policies. In India, Hindu upper-caste dominance became marked by a stridency and coerciveness unprecedented since independence, while at the same time the consent it was based on was sought to be widened. In these (and many other) countries, then, there was a cultural as well as an economic assertion of ruling classes at this time.

Rather than simply 'read off' the Indian situation from Reagan's America or Thatcher's Britain, it is important to mark the historical specificity of the path of development of each country, a point I return to below. An important result of this difference is that 'national culture' in India has a different character from that in the US or UK, with a shorter history and a far narrower popular base. Since independence, the task of 'development' has been understood as predominantly economic, with culture being treated as a residual category. With the labours of the state directed elsewhere, 'national culture' has largely meant official propaganda indifferent to its reception.[6] In contrast, its counterparts in the US and UK were well-established in popular understandings of national identity as distinctive, superior, racially based, and endowed with a global mission (which was past in the case of the UK, but as the Falklands war proved, could be quickly revived). The notion of national identity promoted by the Indian government was in many ways similar, for indeed it was modelled on the west, but it was little known beyond a segment of the predominantly Hindu, upper caste, middle and upper classes.

Rajiv Gandhi's accession to power saw a determined, high-level attempt to popularise this vision of national identity for the first time, with the employment of native idiom and vernacular narrative traditions. Those who followed the news then may recall his wearing a sacred thread above his vest during his mother's funeral rites, which were nationally televised. This was a hint, for those attentive to such symptoms, that the public culture of the Rajiv Gandhi regime would bring with it something quite old, but worn in a distinctively new fashion. Cultural sponsorship concentrated on the spectacular form, to reach beyond the educated minority as well as to highlight the state's imprimatur on the events. A guiding precedent was perhaps the 1982 Asian games, which for the first time in India were broadcast in colour, and won large domestic audiences. There followed a host of other events, with the sponsorship of 'Apna Utsav', the festival of

India in the US and in France (and their transmission back to India via the media), and perhaps most important of all, the initiation of 'national epics' on the newly institutionalised national programme on television. These were novel ventures—epitomised by television, which created for the first time a single cultural platform that could be 'shared', in some sense, right across the country; and in the early, crucial years the state served as undisputed ringmaster of the show.

The mid-80s saw the ensconcement not only of national television, but the burgeoning of other media and media-related businesses—the advertising industry alone quintupled in size over the decade. With the boost given to consumption by Rajiv Gandhi's government, the increasing prominence of the media signalled an industrialisation of not only material cultural goods but also of 'culture' in general. The things people used, as well as the ideas and images they received, were more and more part of a single circuit of consumption, relayed by industries that for all their differences, were engaged simply in the business of business. The unprecedented centralisation of cultural production makes understandable the circulation of similar narratives in different fields—economy, polity, and culture, as social discourse increasingly begins to pass through a small number of interconnected channels. Just as the value workers produce is alienated from them, socially produced meanings too are, increasingly, privately appropriated through the media.[7] While these channels are far from reaching all of society, as apparatuses of its ruling elites thay claim a new representativeness for public discourse by virtue of the 'consent' implied in winning media audiences.

With the growing distance between lived experience and public culture, however, the commitment implied by audiences' consent no longer has the guarantees personal presence would entail. Commitment then becomes far more fluid and mobile, being based more on the gratification different images afford than on any investment of personal resources. Where this refers to box office receipts at cinema halls, and other such market activity, it is but an indication of the rhythms of the economy at work. With the recent rise of communalism, however, politics has drawn from and shaped public culture to an unprecedented extent, thereby giving politics claims to represent lived experience in a way that it did not before. A highly disciplined and organised force like the RSS, which has overseen and propelled the growth of communalism, can exploit this altered form of commitment to present its own politics as representing those of the public at large. The Sangh parivar's appeals to identity, exemplified here by Ram Janmabhoomi, overlapped with the rhetoric of advertising and consumerist identity formation. The overlap was necessarily partial; it arose as part of a broad stratagem to maximise acceptance across as wide a section of society as possible, priming the field as it were, for the RSS's storm-troopers. Such a view helps disarticulate essentialist notions of a fundamentalist monolith, and specifies how acceptance of the Hindutva agenda may have been partial rather than complete. At the same time, it highlights the swift slide possible (and recently witnessed) from a consumerist celebration of a 'Hindu' identity, to a libidinal collective identity which requires violence against a satanic 'other' as its chief form of expression.

I understand the rise of communalism as both an expression and a consequence of changing ruling class strategies to retain political power, in a society undergoing 'passive revolution'. That is to say, while ruling classes may support communal forces, they may not identify with them at all times; in communalism's most violent manifestations, ruling classes may attempt to retain it as 'a dog on a leash', i e, as a threat to be controlled.[8] Randhir Singh has pointed to the 'massive feudal-colonial inheritance' of the ruling classes, in a society characterised by deep religious divisions, as leading to communal politics by the ruling classes (1988: 1548). The ruling classes are not monolithic; rather, as Bardhan (1984) has argued, they form a coalition of different groups; the relationships amongst these groups, then, require reproduction and renegotiation. Communalism is to some extent the expression of relatively new, vernacular elites vying for power against older, more often English-educated elites, although the last few years have seen a blurring of this distinction, with more and more educated professionals espousing communal views. In a very limited way, the spread of communalism has been contested, with the Congress Party periodically resisting the BJP's advances in the temple movement and getting a postponement of 'kar seva'—although such moves prolonged the issue as much or more than they impeded it. To what extent the face-off between the two political parties was real may be briefly indicated in the outcome: the BJP achieved its immediate objective of masjid demolition, while the Congress stayed in power. The support given by large corporate houses to the Shiv Sena, whose labour unions are used to smash independent workers' organisations, is only one instance of the support given by the most 'modern' segments of the ruling classes to communalism.[9]

Gramsci's concept of the 'passive revolution' refers to the means of capitalist development alternative to the 'classical' path. Whereas the bourgeois ascent to power in the west was accompanied by a revolution in social relations, and had the character of a genuine movement, this was not the route in other countries such as India. In the latter case, capitalist accession to power came first (through 'transfer of power'), and social-economic restructuring came subsequently, via legislative intervention by the state. Despite the teleological implications of the term, Gramsci stresses that the ideological schema of the passive revolution creates a set of expectations with its own force; the success or failure of the attempt is therefore a secondary question. Here he cites the case of Italy, where the aspirations of the great mass of the urban and rural petty bourgeoisie were raised, enlisting their services in the reinforcement of the hegemonic system of the traditional ruling classes [Gramsci 1988: 267]. In India too, a predominantly state-led process of capitalist development can be seen as now undergoing a process of restructuring, of delegating a larger share of power to the system of 'fortresses and earthworks' of civil society [Gramsci 1988: 229] to private businesses and to dominant Hindu upper caste elites. Corresponding to this, then, is a turbulence amidst which ideological rearmamentation is being sought, suitable to the changing formation of power being attempted.

What is dissatisfying about most class-based explanations is the economism they imply, reducing all questions of human agency and motive to expressions of 'His Majesty, the Economy'. What results is an apparent exhaustion of the meaning of any event by its description as 'serving ruling class interests'—a top-down, rigidly functionalist view that suppresses any further questions, for instance about contradictions in the working out of ruling classes' interests via contingent processes that have no guarantee of success. Here, Gramsci's notion of hegemony is helpful, in foregrounding the necessity of winning the active consent of subaltern classes, of defining the terms of debate so that dissent itself may occur within a larger field of consensually-based politics via a process that is uneven and contested. Examining meanings in discourse offers a way of directly addressing human agency, since agency is informed and directed by meaning.

If we connect discourse analysis to uncovering individual agency, how are we to understand its simultaneous connection to larger social processes? We can begin by considering Erving Goffman's notion of frames. Drawing from Bateson, Goffman has defined frames as mechanisms by which reality is selected and ordered, in patterns for making sense of the world. Frame-making is hardly explicit, or perceived as imposing order from without. Rather, it emerges as individuals confront a chaotic world and struggle to retain orderly perceptions amidst an infinity of sense-perceptions. While Goffman makes skilful use of the concept, it risks becoming a static and two-dimensional

grid that limits movement and development, leaving human agency outside the 'frame' itself. (This has in fact been its fate in media sociology, for instance.) Most importantly, his methodological individualism does not allow for broader cultural patterns that may span social formations. Recent theorists, such as Hayden White, drawing from literary studies, point to the production of narratives as the basic function of culture. He discusses the relationship between narrative and culture in broad terms, acknowledging the primary role of subjectivity and desire in the process of "making sense" of the world, of constructing a sense of order that is both "out there" and needs to be fulfilled at the same time. "What wish is enacted, what desire is gratified, by the fantasy that real events are properly represented when they can be shown to display the formal coherency of a story? In the enigma of this wish, this desire, we catch a glimpse of the cultural function of narrativising discourse."[10]

Narratives make sense of the world too, but they invite the investment of the subject's desire in their progressive unfolding; as scripts of the culture at large, they have a certain external, coercive power, but nevertheless, require subjects' agency for their fulfilment. We may think of a narrative as a series of (culturally prescribed) frames, in a film whose viewers are also protagonists, in a sense. Socialisation then consists in the making invisible of narratives, of rendering them naturalised aspects of the world. And social conflict represents not only contests of different, opposed narratives, but also the failure of narratives' prescriptions, as they clash with a reality indifferent to human desire.

Marx's notion of commodity fetishism, which usefully connects relations in the economic 'base' with 'superstructural' relations, prefigures the discursive emphasis being made here. Commodities in capitalist society appear to have a magical life of their own, although they are in fact a product of human labour. Instead of forming an attribute of the producers and an expression of their effort, they appear external to them as objects that of their own accord 'rise' or 'fall' in price, 'move' and 'circulate' amongst various people, 'improve' or 'decline' in quality, and so on. Moreover, these movements and changes in attributes actually determine the lives of those who produce these objects: "[A] definite social relation between men assumes, in their eyes, the fantastic form of a relation between things."[11] Marx is referring here to the ways in which things are described (" in their eyes "), or the narratives that are constructed to 'make sense' of capitalist relations. Such narratives invert 'real' social relations (and so will eventually be overcome, for Marx), but they do express the partial historical truth of the producers' subjugation. Marx understands this as a cognitive rather than an emotional perception: as commodity fetishism permeates society, social relations are misperceived as relations between things. Desire plays no part in this process, for Marx, save to express itself as alienation from species being.

Desire enters, however, with the language of advertising, which develops with mass production and the emergence of 'consumer society'. Advertising naturalises the mysterious 'life of things' and affirms it as the source of all positive human attributes. Whereas Marx saw commodities as alien and opposed to workers, who became paupers as they produced more goods, the shift to 'mass consumption' heralded a change in this regard. Provoking desire now forms the basis of escalating production of goods: consumption is held out as the guarantee of a good life, or the salve for an alienated one. Advertisements build a cluster of qualities and attributes which, by allusion, argumentation and imagery, are associated with a product or a 'brand name' and can transfer to the buyer. The nature of the 'transfer' is of course purely magical, as Raymond Williams has pointed out, and stands out sharply against the rationality of capitalist production itself [Williams 1980]. This 'magic' is nothing but the projection of the consumer's desire onto the objects whose attributes she desires. Consumption, in this situation, is a means to achieving identity, a project of self-definition using socially approved meanings.[12]

In seeking an analogy to explain commodity fetishism, Marx took recourse to "the mist-enveloped regions of the religious world", where the emanations of the human mind come alive as independent creatures, "entering into relations both with one another and the human race" (1954: 77). Marx's critique of religion, in fact, foreshadows his later critique of commodity fetishism. The objects of human worship, he said, were merely the projections of humankind's most valued qualities onto an external being, which was then believed to have power over them. When alienation was overcome, he argued, men and women would come to recognise themselves as the true makers of their history; religion itself arose as an expression of the lack of power over their own lives.

The historic distinctness of commodity fetishism as an expression of alienation is that, in capitalism, human self-reproduction through labour is itself alienated, as the product belongs to the capitalist rather than to its producer. This clarifies the receptivity to advertising as a means of fashioning personal identity. With the progressive erosion of social relations in use-directed contexts of production, traditional sources of identity are scarcer even as the crisis in identity becomes more urgent. If the old sources are scarcer, Marx's argument seems to suggest that the old models are still useful, with religious magic lingering on in advertising. This pertains to the appeal of the Ram Janmabhoomi campaign, which certainly used the methods of modern publicity. The galvanising power of the issue proved that the meanings evoked by its archaic-seeming subject had all the force of contemporary concern. How can we understand the subject-position constructed in the campaign: what desires are mobilised in it?

Ram Janmabhoomi and Construction of Desire

I will begin with a brief consideration of the Ramayan serial, whose broadcast from January 1987 to August 1989 (with a break before the final Uttarkand) covered the most crucial phase of the Janmabhoomi movement, when it changed from a relatively little-known 'tala-kholo' agitation to the dominant political issue before the country, one that made and unmade prime ministers and ruling parties. With the Mahabharat serial that followed on its heels, the Ramayan achieved record viewership in every part of the country (something no serial before it had done), and made Sunday mornings 'belong' to it; any public event scheduled for that time courted disaster. Many commentators, including supporters and critics both, of the Sangh parivar, have noted the enormous impact of the Ramayan serial in preparing the ground for the Janmabhoomi issue. With such publicity given to its pre-eminent symbol, it is not surprising that by the middle of 1989, the BJP itself later declared that the Ayodhya movement "had reached a state and status in Indian public life when it was no more possible to ignore its effect in politics, including electoral politics".[13] Before the serial was over, the VHP had conducted its shila pujas and shila yatras, and in June 1989 the BJP made its historic resolution at its quarterly executive session at Palampur, to adopt the Ram temple issue in its electoral platform.

The decision to televise religious serials represented a considerable departure from earlier broadcasting policy, and clearly signalled an attempt to formulate a cohesive, Hindu upper-caste dominated cultural identity for the nation.[14] Justifying the telecast of the Ramayan serial, the information and broadcasting secretary overseeing the decision, S S Gill, described the epic as cultural rather than religious, with universalist values applicable to all. There was a majoritarian premise to his argument, but clearly, the quotes were being removed from 'religious' programming: a Hindu epic was now identified with Indian culture in general.[15] The director of the serial, Ramanand Sagar, who described himself as a 'romanticist', rendered the story in a highly sentimentalised fashion, with a glacially paced script, and copious use of deep close up shots.[16] He introduced the conventions of the Hollywood soap opera to an epic tradition, with shot-reverse shot sequences and alternating close-

ups following every master shot. This replaced the embodied narrator of poetic convention, of a Valmiki or Tulsi rendering a highly personalised story and making his direct address to audiences, a thread parallel to and interweaving with the entire length of the epic. Sagar's production positioned a disembodied, omniscient spectator akin to that of conventional cinema. This reinforced a certain voyeuristic emphasis in presentation. Hammering insistently on the idealised behaviour of the story's protagonists, Sagar made every interaction an emotion-choked encounter as characters were made to emphasise the extraordinary 'bhava' of each act. In the process, he used the small screen to advantage: the deep and prolonged close-ups suggested the visual capture of emotions, and the repeated reaction shots served to reinforce the sense of a tightly homogeneous moral community with the entire cast unfailingly responding in like fashion.[17]

The highly romanticised relationships depicted an idealised inter-subjectivity in which the protagonists made unearthly sacrifices for each other casually; and that is indeed the ethos of both the Tulsi and Valmiki Ramayans, from which Sagar claimed chiefly to have drawn his material. In Sagar's serial, when Bharat accosts Ram in Chitrakoot to offer him the kingdom and is told to keep it, he asks if Ram would fulfil a request. Ram replies, 'Pagle! Tu mere pran mang le to is kshan de doonga. Bol, kya chahiye tujhe?' [Idiot! Ask for my life and I will give it to you this moment. Tell me, what do you want?]. To which Bharat says, 'Mujhe apni charanpaduka de do' [Give me your wooden sandals]: he will use them to represent Ram during his absence from the throne.[18] Such a discourse of extreme self-abnegation and mutual sacrifice could be taken as parodic, but was in fact widely understood as a literal description of a bygone past.[19] As figures in a distant past, the characters engaged in secure, selfless relationships that showed no hint of the uncertainty customary in real life. If identification occurred, then, it was to the exclusion of any threat of recognising oneself in them. Viewing therefore had an important vicarious aspect, with the serial seen as endorsing much-desired possibilities unrealised in present-day society. The abstraction employed in Sagar's Hollywood-influenced positioning of the all-seeing absent viewer is a crucial technical determinant of this vicarious reception.

Eliciting accounts of the serial from viewers supported the understanding that, while they may have responded emotionally, they discounted the possibility of the viewing experience carrying over into daily life. One letter from a viewer stated: "Everything in the serial is simply too good. We become so emotional while watching the relationships between Ram and Lakshman and between Ram and his mother." "Often tears come to my eyes", said an ex-MP in an interview. "Then I think life should be like this, on the basis of ideals." But many viewers were scornful about the idea that people would be affected by the serial: "The way Ram gave up a kingdom and went to the forest to save his father's honour... Who would do that nowadays?" wondered one worker. "Today a son would say, you go to the forest, I'll stay here." Another viewer expanded on this theme: "People take the Ramayan as entertainment", said a small businessman. "Rarely you will find in families today that members fulfil their duties. Today we don't want to sacrifice. Today we want that Bhagat Singh should be reborn, not in my family but in the neighbour's... Today's mentality is that he suffers, I enjoy the fruits."[20]

Viewers are of course usually the first to discount any question of effect or of ideology. What these answers suggest rather is that the Ramayan serial made images of sacrificial relationships, via personable Hindu icons, seem painless and even desirable. Projected onto a distant past, both the plausibility and the implausibility of the story could be accommodated together in a dynamic contradiction—this became part of the tragedy of the nation, which had once attained greatness and today was in dereliction. The theme of loss, alluded to but never directly addressed, underlay the entire serial. In interviews, it was explained that the culture and values of olden times had been lost, that people required reminding of them.[21]

Viewed in the privacy of the home, the notion of a great Hindu culture as a libidinal collectivity came to exist in the intimate spaces of people's lives, and over the lengthy period of broadcast, these images became familiar, domesticated and comfortable. This was arguably a key symbolic backdrop against which the Ram Janmabhoomi movement can be seen to have 'taken off'.

The resonance of the term Janmabhoomi is important by itself; that it is Ram's only highlights this importance. Two narratives overlap here. First of all, the quest for Janmabhoomi implies a dislocated individual subject, one who seeks to regain his or her old moorings, spatialised in the 'birthplace'. There is a promise here of regaining a primordial oneness with the self, of reconciling the divisions within the self in the unity of that self-evident location. The frequency of migration, resettlement, or just 'moving on', with the indifference this implies to context, local ties and continuity of tradition, are part of the existential backdrop here.[22] Fused with this is a broader historical narrative, of the failure of post-independence India—with Ram presented as a national symbol, even *the* national symbol, of a return to origins as an attempt at revitalisation, of the renewal of the distinctive energy and spirit of the national project.

Social theories tend to describe temporal processes in a pre-existing spatial order; the latter is not analysed so much as taken for granted, and treated as a contingent, neutral category; time itself is understood as singular, homogeneous, linear and irrecoverable. What is remarkable in the Janmabhoomi issue is the privileging of a highly particularised space as the market of that lost time—'mandir wahin banayenge'. This occurs against the context of modernity, in which space and time are both emptied and made homogeneous. The insistent claim—there and nowhere else—as baseless as it was maniacal in its relentlessness, embraced a resistance to the ephemerality of modernity. Simultaneously, there was the unprecedented concretisation of a figure of hitherto only fuzzy historicity. Suddenly, the claim to have identified his birthplace uniquely became "an indisputable fact of history", in a statement of justice Deoki Nandan, then president of the VHP.[23] It was also "indisputable" for justice Nandan that a Hindu idol consecrated as a deity "has a juridical personality of his own. He is capable of owning property and of suing and being sued in a court" (ibid p 12). Nor is this excess characteristic merely of the VHP. In a response to a petition demanding darshan of the Ram Lalla idols at the site of the demolished mosque, justices H N Tilhari and A N Gupta of the Lucknow bench of the Allahabad High Court ruled, on January 1, 1993, that Lord Ram was a "constitutional entity and admittedly a reality of our national culture and fabric and not a myth." They based their contention on the presence of a sketch of Ram among the illustrations present in the original constitution of India, which according to them proved that "the Constituent Assembly accepted the history of Rama in relation to the places as a fact, a reality of national pride and cultural importance (*sic*)".[24] Here the fetishism of images is, with a degree of consistency rare in modern society, decreed to have the status of law!

This corresponds to the lately degraded status of myth. Considered incompatible with a 'scientific temper', myth is equated with untruth or falsehood, and is thus unable to anchor a defensible politics. Hence the need to insist relentlessly on the literal truth of the Ram figure, and to construct a new body of myths around it, now named as 'fact'. This was paralleled by a change in the modes of representing the figure of Ram. The Janmabhoomi issue transformed Ram into a symbol of a militant campaign claiming to span the country, and standing simultaneously for nation and citizen. It was a reduction that by the very vociferousness and repetitiveness of the claims, acquired a force to be reckoned with.

The following excerpt from a booklet, by Balwant Rai Garg, on the October 30-November 2, 1990 firings in Ayodhya, *Sri*

Ram Janmabhoomi Mandir: Ayodhya ki Rakt Ranjit Gaurav Poorn Gatha, or 'Ayodhya's Blood-Stained Pride-Filled Story', minces no words in its uncompromising declaration: "In Ayodhya Ram janmasthan is the foundational pillar of our culture, it has always been the inspiration for the ideal of *apnai* in social life".[25] A bi-lingual pamphlet of photographs narrating the December 6, 1992 kar seva, Sundar Kanda in Ayodhya, projects the movement to build a Ram temple as a centuries-long struggle that has obsessed 'Hindu society', and in fact been its defining trait through the ages:

> Ayodhya, the Mokshadaini [giver of salvation], is the birthplace of Lord Sri Rama, who is the sole, heart and very life of Hindu society (*sic*). Babar the invader got destroyed the temple that stood on Ram Janmabhoomi... Hindu society never accepted this humiliation and waged 76 wars in which four lakhs laid down their lives to erase that stigma. Unfortunately even after the independence Congress also followed the same political game. Hindu awakened and realised that he is deceived by Congress. and pseudo-secularists (*sic*). Seething anger of Hindu volcano erupted on December 6, 1992 at Ayodhya.

Nor were these crudities confined to popular pamphlets. In the BJP's 1993 White Paper on Ayodhya and the Rama Temple Movement, L K Advani began his preface thus: "Sri Ram is the unique symbol, the unequalled symbol of our oneness, of our integration, as well as of our aspiration to live higher values. As Maryada Purushottam, Sri Ram has represented for thousands of years, the ideal of conduct, just as Ram Rajya has always represented the ideal of governance." By 'our', Advani meant, of course, both Indian and Hindu; the two were equivalent.[26] In this series of astonishing condensations, the history, polity and culture of India are all comprehensively expressed in the single figure of Ram, for whom, it then goes without saying, everything must be done to protect.

Parallel to this was an extensive refashioning of the Ram icon itself. Conventional iconography shows Ram *en famille* as it were, flanked by Sita and Lakshman, with Hanuman at their feet. Ram's expression, as befitting a maryada purushottam, or ideal man, is gentle and serene and in harmony with himself. He is finally reunited with his wife (until the Uttarkand at any rate—a phase of the story marginalised in dominant representations); after years of uncomplaining renunciation, he has the reward of long-denied grihasthashrama, and has been crowned king. Piety and obedience, with selflessness and compassion, are perhaps the virtues he has most been celebrated for; and these are qualities well-befitting the householder depicted in the extremely popular picture described above, of 'Pattabhirama', Ram anointed as king. The deities are in full front view, positioned in a stately, ceremonial stance fit to receive worship, confirming their divine status. This is characteristic: to depict deities in dynamic poses would indicate incompleteness, with desires as yet unfulfilled, and thus as more human than godlike.[27] The manner in which the VHP defined its Ram symbol represented a considerable innovation—Ram having been plucked out from what was traditionally shown as a pantheon and presented as a solitary hero, and striking a range of poses as if to suit the varying mood of the consumer: child-like, adult and war-like, benevolent and godly, and so on.

Ram encloses contradictory attributes: he is described by Valmiki and Tulsi as softskinned and almost girlish in appearance, and self-effacing in nature; yet he is mature in temperament, manly in his courage and invincible in battle. Androgynous in his looks as well as his character, with the appearance of youth and the wisdom of age, he offers semiotic plenitude for the propagandist: a wide variety of characteristics could be attached to Ram and still gain popular recognition. The VHP draws from this repertoire, but goes beyond it, using the representational modes of Hanuman and the infant Krishna as well, to present Ram in the guises of the three most popular male deities in northern India. Hanuman is the only god from the Ram legends who is typically shown by himself, and often in mid-stride, putting his strength at Ram's service. This pose is simulated and enhanced in a widely distributed picture, when the angry look on Ram's face is mirrored in a turbulent sea and a stormy sky. His torso is proportionately bigger than usual, and he is shown as finely muscled, emphasising the masculinity of his image. His hair and his malas are disarrayed in the wind, he holds his bow aloft, as if about to shoot. The whole mood is apocalyptic: violence is understood as the means by which earth, sky and human alike will regain calm.

The Ram Lalla image, which represents an emphasis on the infant phase of Ram's life, is an innovation in the tradition; both Valmiki and Tulsi, for instance, dispose of Ram's childhood in a few verses. Shown sometimes in a crawling posture, and at times holding bow and arrow, the playful-looking, creamy-complexioned child is readily associable with the infant Krishna and with baby food ads as well, reinforcing the maternal impulses it is meant to appeal to.[28] Other pictures show Ram in a more traditional ceremonial stance, and more feminine in appearance, smiling and with his hand raised in blessing, superimposed above a picture of the would-be temple. The temple itself, it should be pointed out, is syncretic in design, incorporating south Indian style 'gopurams' which are subordinated to a north Indian-style 'shikhara' quadruple their height. In one picture, while Ram is in statuesque front view, his expression is pensive, and he holds up his right index finger rather than his hand, as if in warning.

A range of portrayals of Ram is offered to invite devotees of every persuasion, so to speak. But this is only an apparent plurality of meaning; in effect, the variety of meanings evoked by the various images are all meant to be subordinated to the singular one of Ram in 'krodhitbhava', leading an army to avenge injustice. The effect of the latter portrayal, as a VHP activist in Ayodhya told me, is that people get inspiration from such a depiction.[29] Clearly, the kind of inspiration derived from more traditional depictions of Ram is inappropriate for the VHP's purposes. Uma Bharati was derisive about the older depictions, and made it clear that for all the variety of Ram images the VHP may offer, only one of them was on their agenda: "'Haan', that picture of Ram, with Hanuman bowing to him, or Krishna playing the flute. That's why we are so weak and ineffective. You have to show them fighting. Krishna with a chakra, Ram with his bow drawn."[30] In contrast with the old iconography, which provokes reverence and contemplation, the VHP representation is propagandistic and seeks to steer and direct thought and action. Thus there is a careful selection and rearrangement of elements from the available repertoire according to the kind of behaviour sought to be provoked.[31] The point is not, of course, to stimulate 'Hindu' consciousness as such—least of all in the vaunted plurality and inclusiveness of that term, but to attach the appellation 'Hindu' to the desired aggression.

The structure of these portrayals is similar to that of commercials themselves: (a) abstracting meaning/value from certain familiar symbols or images (in this case, aggression from the polyvalent symbols of 'Ram'); (b) asserting an equivalence between the meanings/values of the images and that of the brand name or identity being promoted (so that Uma Bharati's Ram stands for Ram in general, and connotes Hindu aggression); and (c) urging an exchange of the reader's money/acceptance/allegiance for the brand name or identity ('Hindu', 'Ram'). That is, like advertisements these portrayals are structured on the model of commodity exchange, with all the violence to specificity that implies.[32] However, their rhetoric of necessity emphasises the uniqueness of the transaction being advertised, of the special affinity between product and consumer, and the pre-destined nature of the satisfaction/success to follow. At the same time, because the co-operation of the reader is required, an element of uncertainty is introduced, this is represented as the individual's effort to remake herself, as a (potential) triumph of will. We see in the advertisement, then, a

characteristic conjoining of contingency and fate, of individual effort and pre-destination.

A series of advertisements made by the BJP's election campaign advertisers, announcing a "new identity" for a corporation, is useful here in clarifying the kinds of links that are made between Ram Janmabhoomi and consumer identity. The ads attempt to sell acceptance for the company's image rather than for a product *per se*, but this does not affect their basic structure. The Madras-based company, R K Swamy and Co, was founded by its owner in 1972 after years of service at J Walter Thompson.[33] The company, now a subsidiary of BBDO, has been engaged by the BJP for the past two elections to devise its campaign propaganda. The ad series is a post-demolition series, appearing shortly before the crucial 1993 assembly elections. It is made for Greaves Limited (formerly Greaves Cotton Limited), an engineering group subsidiary of the Thapar Group of companies. The ads each carry a picture of a large pyramid against the sky, seen from the base of the structure, with a smaller, blue-white pyramid emerging from one side of it. The logo of the company is the smaller pyramid itself, which has a stylised graphic of a phoenix, signalling resurrection.

In the first ad, the legend above the picture, in large type, goes: We went back 5,000 years to be in great shape for the future.

The sky against the pyramid shows uncharacteristically saffron tones suffusing a dark sky as the sun comes up, suggesting the dawn of history, and perhaps a Hindu history at that. The picture of the smaller pyramid emerging from the larger one signals the broader theme, at any rate, of deriving the company's identity from 'history'. The text on the side of the ad, begins in small type, signifying 'basic information':

The Great Pyramid of Egypt, a 5,000-year-old monument, is more than just a tourist attraction. It is a storehouse of extraordinary powers. An embodiment of engineering perfection. A symbol of enduring strength. And an elusive secret of superior knowledge. [And in slightly larger type] *Precisely all that we stand for.*

Of the handful of old monuments held to symbolise an entire civilisation and, by inference, modern-day nation, the Great Pyramid is probably the oldest. This highlights the nature of the claims intended—first, oldest, strongest, most superior, etc. That is, all potential competitors can be answered with finality: no argument is possible. On seeing the pyramid, we remark not merely a physical structure that has endured the elements but also the mysteries of its survival itself: this points to the power and knowledge that must lie behind such a marvel. Little attempt is needed to actually understand the 'elusive secret' of the pyramid's makers. With these extraordinary qualities, the message is clear—they are all that 'we' stand for. As an ancient civilisation whose age and ill-understood wisdom are generally invoked as tokens of its greatness, 'India' is an obvious referent here. The pyramid itself is not the focus, so much as its age and associated qualities, aspects with a ready resonance for an audience recently animated by the assertion of special powers claimed for another structure.[34] The elusive secret of superior knowledge is lost to us, but its proof endures. Loss is elided over in the text's gliding between past and future, as underlined by the main legend. "We went back ... for the future". Loss is a feature of the present, impelling movement beyond its frame.

A broad red band separates this from the 'argument', printed in larger type:

Quite naturally, we adopted the Pyramid as our new identity. And shortened our name to Greaves Limited.

We've also realigned ourselves ...to ...synergise ...and grow in size and stature ...to become a global force in the years to come.

Rarely has the past so accurately defined the shape of the future.

The company logo is then reproduced again, with the words: *Greaves Limited. We're in Great Shape for the Future*

Identity here is a choice, shaped albeit by an affinity of attributes, by natural likeness. The need of the present, then, is to recognise oneself and one's powers through judicious selection from symbols of the past. The superior knowledge of the past may have become secret now, but to recognise its superiority and appropriate it for oneself is crucial. What lies behind this notion of identity that one simply appropriates by fiat? A profound declaration of will, and of an ability to refashion the self to be 'in shape' for the future. The choice of a new identity poses a question about the nature of the old identity, but again the issue of loss is only elliptically raised: the needs of 'the future' create an imperative that is immediately intelligible, and requires no explanation. The uses of identity, it appears, are thoroughly worldly, though its choice seems mainly a matter of self-recognition. The rewards will be gratifying: one 'grows in size and stature ...to become a global force in the years to come.' There is deliberation in the choice: 'We went back 5,000 years...', and yet both the event of that choice and the growth it bestows seem 'natural', even foreordained: 'Rarely has the past so accurately defined the shape of the future.'

The suggestions proceed on parallel lines that are nevertheless presented as united. Identity is chosen, yet it is natural; it has to be sought out, and yet it is fated. Agency and destiny are fused here in a dynamic contradiction that bestows the confidence of success to action, while asserting the necessity of will. Advertisements acknowledge a certain contingency (in the associations, and by implication in the encounter of consumer and message) but ultimately reveal this too to have been the working of fate. Identity, after all, is the overcoming of the split between subject and desire.

The subsequent ads in the series elaborate on the pyramid's qualities, which are said to have inspired the philosophy of the company. Each text concludes with a line which, in the context of the ad alone, is curious, and lacks the kind of ready resonance one is accustomed to in advertising: Rarely has a "pile of stones" provided such a solid foundation for growth; and: Rarely has such a "passive piece of history" had such an impact on the future of business. In a sense, the allusive argument begun in the first advertisement becomes progressively less nuanced and instead more direct and literal. In a displaced way, these ads are referring to the Ram temple that is alleged to have stood at the site of the Babri masjid, and to the demolition of the masjid. The aggressive thrust of the Hindutva movement is here reasserted as an identity offering a vital impetus to business growth. Reiterating his party's commitment to liberalisation before the 1993 assembly elections in an interview with *The Economic Times*, L K Advani echoed similar ideas in explaining why business should support BJP: "I think [the] approach of the present government stems from diffidence, a sense of inferiority complex and a lack of faith in the capacity of the country itself to face the present economic crisis. And since there is no conviction as a party... it is not fit to be an instrument of change."[35]

Advertising takes the fetishism of commodities for granted, making the second-order 'reality' of capitalist society into a naturalised, first order: the power individuals have is to empower themselves by purchasing/appropriating things. We may raise the question about advertisements—why do individuals have to be told how to empower themselves, or make themselves desirable to others, and if they had this power before, how did they lose it? This is a question advertisements may provoke, but they prefer to elide over this moment, focusing at most on the inadequacy generated by loss. Their emphasis instead is on the accessibility and desirability of renewal and fulfilment.

Hindu Imagery and Narratives of Improvement

The rhetoric of Ram Janmabhoomi, to its ineffable advantage, centres on this elided moment, on the violence of loss, on the pain and humiliation of an enforced deprivation,

all encapsulated in the demonised figure of the Muslim 'other'. It is at this point that the narratives of Hindutva and advertising part company. The story advertisements cannot tell is that of the founding violence of a commodified universe where men and women strive for a uniqueness and individuality made impossible by the levelling force of exchange value rendered dominant. Ram Janmabhoomi propagandists allegorise this originary violence with their story of the 'foreign invader' whose brutality and destruction echo across centuries. Their dwelling on the moment of loss renders the communal solution that follows urgent and vivid. The focus on addressing the individual gives their discourse a compelling immediacy. Most important, we have now entered a world in which there is no question of contingency or uncertainty in the resolution of identity. We have here a Manichaean order where a razor-sharp line separates good and evil, and the righteous have no recourse but to join in the life-or-death struggle against the enemy.

The Hindu imagery in market circulation, in Ramayan videos, calendar art, or advertising, redefines popular symbols, and proffers an invigorated sense of identity by inserting these symbols into a narrative of improvement. So far, the transactions involved replicate those of commodity consumption, and like the latter, offer success as the reward for the effort of allegiance/purchase. The rhetoric of Ram Janmabhoomi, however, cannot allow its addressee merely to entertain its message, or to weigh whether or not they choose to invest in it. The very possibility of rational calculation is swept away with the urgency of the crisis—one must join or die! The sense of complete redemption entailed in the discourse's abolition of doubt is cathartic.

The following excerpt from a widely distributed article entitled 'Angry Hindu! Yes, Why Not?' is symptomatic of the kind of rhetoric involved:

> Yes, certainly I am angry. And I have every right to be angry... Otherwise I would be no man. Yes, for too long I have suffered affronts in silence... My temples have been desecrated, destroyed. Their sacred stones are being trampled under the aggressor's feet. My gods are crying. They are demanding... reinstatement in all their original glory. When I speak out my agony, you of the secular tribe condemn me as a threat to our 'secular peace'. You add insult to my injury. . I now realise I had been too good for this world of 'hard reality'. I believed that others would respect my gods and temples as I respected others'. I believed generosity begets generosity.. But alas, again and again I was deceived... I was stabbed in the back.. My goodness has been turned upon me. I know now a bit of the ways of the world. And I have decided to speak to others in the language they understand. And finally I have come to know the value of my anger itself.[16]

The language exceeds its subject, and invites those with a variety of grievances to share the writer's indignation. Those accused are only vaguely referred to; almost any object of fear or hatred could be that 'you'. Accepting this writer's meaning offers absolution, an identification with the 'I' who has only been 'too good', although he seems to have lived to tell the tale. A closer reading elicits a strongly gendered imagery: the absolution offered is of a distinctly masculine kind. In his 'silence', in the condemnation he invites by 'speaking out', in being 'stabbed in the back', there is a surfeit of imagery suggesting that the character described is 'no man' if he remains in his passive condition, and that in fact he has been repeatedly raped. In a characteristic set of tropes, the typical Hindu (who is male) is depicted as silent, virtuous and feminine, qualities that bring him only 'insult and injury'. In metaphors meant to taunt Hindu men and rouse their aggression, the message implies that only assertive and vociferous masculinity are the attributes of real Hindus; these are qualities of the Muslims who threaten them, which they must acquire for self-protection.[17] The gendering of the imagery here is far more one-dimensional than that of advertising, which in its construction of the pleasure-seeking yet assertive consumer carries both masculine and feminine attributes (here, as above, I refer to socially constructed polarities of gender attributes, of course, rather than to any essentialised set of differences).

We are now in a world in which people are either of the delivered or the damned, where the choices are of life and death. One VHP pamphlet, *Warning: India in Danger*, that asserts, "The enemy of Hinduism is the enemy of human race (*sic*)", ends: "Please zerox, print and distribute this matter throughout the country, through 10 crore pamphlets (*sic*). This can save India. It is your moral duty. If you are unable to do even this much then you will lose your right to live in India... [T]hen your doom is certain..." The hysterical tenor of these passages suggests the overwhelming of all considerations other than that of survival, i e, of preparing for the violent 'other'. What must be stressed is that, under suitable circumstances, such messages become enormously attractive in the very simplicity of their mechanisms; chiefly the displacement of all discontents onto a tyrannical 'other', and the submergence of the self in the mass struggle against this other. Uma Bharati disclosed that although she had been long used to giving addresses on Hindu dharm, merely telling people to be good Hindus was not "effective," whereas saying: Hinduism is in danger! drew huge crowds.[18]

The private space the consumer is exhorted to use to explore and affirm her subjectivity, namely, the space of consumption is an externally constrained space. Without harnessing individual desire, and providing a space for subjectivity, the social mission of consumption could not be reproduced. Yet by privatising the spaces of individual expression, their social potential is meant to be delimited and regulated. In contrast, the Hindutva mobilisation called explicitly for aggressive political action, albeit under their own stewardship—it was a call to join the suicide squad of Hindutva, in a sense, though mere support was welcome too. The discourse of consumer identity formation and that of Hindutva thus appear far removed from each other. The problems they address, however, are at one level identical: that of securing meaning against prevailing homogenisation, of the need to articulate feelings of injustice as against the erosion of means with which to do so, and the radical insecurity that thus results.

We can now distinguish a spectrum along which 'Hindu' identity is offered, where we can distinguish at least three positions. There is the myth-historicised subject of the Ramayan serial, for instance, whose idealising of the past does not inherently polarise the present, although it has the potential to do so. This subject dovetails with that of the calendar and sticker art of the VHP. The authors of *Khaki Shorts and Saffron Flags*, for instance, cite the remark of a 'paanwala' who pointed to his VHP sticker of Ram and the temple, and declared that he kept it for the picture of Ram, and that he did not want the temple. There is a more distinctly worldly position, with a 'Hinduised' identity as an enthusiastic prescription for renewed confidence and success, as Advani implied in his interview. Finally, there is a summons of high urgency, a do-or-die call to arms to guard against the enemy. These identities are constructed and propagated in the form of images; they do not exist as 'live' role-models, for instance, so much as the spotlighted ends of imagined polar oppositions communicated through the media.

With the enormously increased circulation of images becoming integral to the economy, the meaning of the image and the commitment they entail themselves undergo an enormous change. An image no longer has any necessary connection with its referent, although it trades on the echo of referentiality as the means of enabling its circulation. As example we can cite the gulf between real Muslims and those of the Sangh parivar's propaganda, or that between the Ram of popular traditions and of Hindutva. In a well known essay, Walter Benjamin pointed to the destruction of 'aura' resulting from the mass reproduction of the image. He referred to the uniqueness and irreplaceability of the work of art, situated in a given context and, in older times, designating a sacred space of worship. With mechanical reproduction, he argued, this

is lost; what is gained, however, is the possibility of new meanings being constructed from elements of hierarchical traditional cultures.[39] In the case of Ram Janmabhoomi, the power of the new meanings (which, however, are anything but progressive) depends on their novelty being dissimulated, since they are parasitical on remnants of the aura which uneven development protects. Nevertheless, they call for but a weak form of commitment from the participant: while the idea of verisimilitude remains important, its force is weakened in the impersonal and distantiated context of new forms of mediated communication. Thus individuals may shift from one form of identity to another without necessitating a proportional shift in the distribution of their resources. The comfort of securing identity may be achieved in return for little more than the acceptance of this comfort itself; when voting, it may form the means of choosing between otherwise substantially similar political parties.

L K Advani, who was for many years the film critic of the RSS's *Organiser*, has a vivid sense of the power of the image. The metaphors he uses to describe politics draw more on stagecraft rather than on social forces: on the manipulation of props, character roles, and the difference between spotlight and shadows on stage. The BJP used to be thought of as the A K Hangal of Indian politics, he said recently, a good character actor who could not make it to centre stage. That was changed now, he asserted.[40] He understood that to affect perceptions about his party, it was not necessary to change the party itself: illusion could do the trick. "For the purpose of securing the non-committed vote, you must at least create an illusion that you are likely to come to power", he has said.[41] The "non-committed vote" here represents a peculiarly contemporary breed of voter, one without strong convictions or distinct political affiliations. Choosing a winner is instead more important. We can, of course, immediately relate this to the crucial swing vote of the OBCs in the 1993 assembly elections; their shift from the BJP to the Samajwadi Party was decisive, just as their earlier shift from the Congress to the BJP made the latter's electoral fortunes in 1989 and 1991. The frequent shifts represent a number of important political developments, including an increased political assertiveness of OBCs, and a rejection of the paternalistic neglect they had received for years from the Congress. But the rise of the category, 'non-committed voter', is itself socially symptomatic, and prophesies a swelling in its ranks as well. It indexes the growing reliance on mass media in political mobilisation, and reflects the recent emphasis on identity rather than on interests *per se*, as politically most salient.[42]

The focus on the uncommitted voter, highlighted in the recent media-based mobilisations of the VHP, represents as well a signal reformulation in the Sangh parivar's understanding of its own role in society, and in the stratagems it was willing to deploy in extending its power. Prior to 1983, the emphasis of the VHP and the RSS was on the 'threat' to Hinduism from conversions and the need to keep lower castes within the fold, exemplified by the 1981 Meenakshipuram conversions. As late as May 1984, articles on the awakening of the 'Hindu heart' in the RSS's *Organiser* referred not to the rediscovery of identity, but to the sympathy of upper castes towards Harijan oppression.[43] The failure of this campaign to generate much support indicates an indifference regarding the prospect of diminishing numbers; this may suggest the "fuzziness" of the Hindu community, in Sudipta Kaviraj's sense of the term.[44] Even if the RSS treated Hindus as a quantifiable, precisely definable community, and as always already a nation, such an understanding was not widespread enough, or able to articulate well enough with the issue foregrounded, to ignite a mass movement.

With the Ekatmata Yatra in 1983, we can observe a refinement of publicity strategy. Here, prominently bedecked 'rathas' carrying a portrait of 'Bharat Mata' against the map of the Indian subcontinent, and a huge 'Jal Kumbha' of Ganga water, covered more than 50,000 kilometres bringing the message to small towns and villages of the unity of India; for a sum of money, people could also obtain small bottles of Ganga jal mixed with 'holy water' from more proximate sources, thus appropriating for themselves a part of India's interrelatedness. Little was heard in subsequent campaigns of Bharat Mata, or Ganga jal. New symbols were found to symbolise Indian unity with the same indisputable necessity, symbols that would bring better dividends than the relatively unknown 'Bharat Mata'. But the campaign was claimed to be a huge success. The idea of an outreach programme to retail a concept as it were, reduced to the form of a product, with success measured in the relatively undemanding terms of the public's willingness to 'accept' the product retailed, established a precedent for later use in the Ram Janmabhoomi campaign (beginning with the worship of bricks in the 'Shila puja'). This is suggested in a VHP pamphlet: "The subsequent decision of the leading dharmacharyas to construct a befitting mandir to Lord Sri Rama at the Janmasthan followed as a logical sequel to the above."[45] The 'logical' connection between the two, otherwise quite different, campaigns was precisely that of retailing Hindu identity, I would argue.

The notion of retailing Hindutva for easy consumption was far removed from the understanding and the strategies the Sangh parivar had hitherto adopted. For RSS guru—Golwalkar, the term 'Hindu' defied all definition, referring to a people that pre-existed names and language, and whose distinction was their universality, their all-encompassing nature. The modest mission of the RSS, as the only organisation gifted with the means to share this wisdom, was to actualise the possibility of universal brotherhood, to unite and organise Hindu society, into an "invincible force".[46] He warned against the "short-cut mania", the "mean and ignoble attitude" that a quick route to power existed. "Because of such an atmosphere all around, people begin to think whether there are short-cuts in the Sangh work also. They ask, 'How long do you intend to carry on like this? When will you be able to bring about the total transformation of society that you visualise ..?' Then, they begin to look around and see the mighty government wielding vast powers...They begin to imagine that invested with such resources...they can, within a short time, change the entire face of the country...But let us not be carried away by such a superficial view".[47] The RSS had chosen to change people's attitudes rather than seek political power. The focus on changing attitudes aimed at supra-political power, defining the very horizons of political debate and party conduct, in this sense it was far from being non-political. Rather, it aimed at a stability and an influence beyond the reach of the vicissitudes of electoral democracy. "We come to the conclusion that the type of organisation that we are building—keeping ourselves aloof from the lures and tentacles of political power, but at the same time alert and powerful enough to check the erring powers that be—can alone give a healthy and permanent order in which our society can live and prosper.... Why should we, who have the integrated vision of the entire national life, run after a fleeting thing like political power? "[48] For Golwalkar, the Sangh would inevitably triumph but there was no question of hastening the process artificially. He was particularly disdainful of "today's method of more advertisement than actual work".[49] There was no substitute for slow, long drawn-out organisational work, of drawing more and more people into shakhas and the accompanying daily discipline of an hour's prayer and ritual, until society was eventually coterminous with the sangh. This would lead to actualising Savarkar's dictum, 'Hinduise all politics and militarise Hindudom', a task far more profound in implication and long-lasting in effect than merely winning office.

But by the late 1980s, with the Congress Party weakened and the opposition disarrayed and fragmented, seizing political power at the centre began to seem like a real possibility. The deployment of the Ram Janmabhoomi issue was an attempt at to make a relatively

quick bid for power at the centre, foregoing the patient extension of mobilisation that the RSS had hitherto based itself on. In *Khaki Shorts and Saffron Flags*, the authors have discussed how, from the mid-80s, the parivar's laborious task of making the Sangh coterminous with society was rapidly simplified by their adopting a new strategy. The VHP, which had overseen the growth of an enormous number of subsidiary organisations officially distinct from itself, now declared itself to represent the entirety of Hindu society itself; its actions were now a manifestation of Hindus' collective will.[20] This was of course a claim that could only be sustained by an orchestrated media campaign. Assisting this move was an increasingly specific and concretised definition of Hindu identity. Simple, and easy-to-understand images could be manufactured, if necessary, to define what was for Golwalkar, the undefinable. Nor would they rely on some cartographic deity to make a literalist connection between Hinduness and nation. If popular support was to be quickly mobilised, abjuring long-term grass roots work, the use of already popular symbols was essential. Negotiating discrepancies between RSS use of the symbol—in this case, Ram, and popular meanings attached to it, was a matter of public relations, for which sophisticated apparatus was now available.

The Mandal proposals undoubtedly dealt a body blow to the BJP's bid for power. It exposed their upper caste base and obliged them to take an explicit stance against the commission's recommendations in order not to alienate their constituency. The 1993 assembly elections in the north expressed this fallout, as it were, with crucial sections of the OBCs, notably the yadavs, deserting the BJP. Ultimately, indeed, both the narratives whose parallel trajectories we noted earlier seem to have climaxed for the time being, and are in a noticeable downswing. With the stock market scam indicating what the consequences of deregulation could be, the ignominy of GATT making a mockery of claims of Indian autarky, and inflation now reaching double-digit figures, the euphoria accompanying the early days of liberalisation has been replaced mainly by nervousness and anxiety. Economic reforms continue, nevertheless, but with little attempt to invite the masses onto the stage of history, so to speak. Rajiv Gandhi, on his arrival in office, had loudly proclaimed that the middle class was going to revolutionise society with its superior business sense. His triumphalism, undergirded, albeit, by debt-induced economic growth, produced for a while a rhetoric of popular participation in nation-building which sought its cultural complement in a 'soft saffron' Hindu identity. In a society where, after independence, there had been a firm exclusion of the masses from any discussions of nation-building, this was a risky enterprise, as events turned out; there was no longer a Mahatma around to fast in protest against actions that went 'out of control'. It would be surprising, however, if the limits of image-based mobilisation are not tested again: the narratives constructed may stand revealed as partial and motivated, as with that of Hindutva, but a considerable amount may be accomplished (and accumulated?) while the narratives themselves manage to stay in circulation.

Notes

1 The overall GDP growth rate between 1950 and 1989, 3.7 per cent p a, is still lower than that of all developing countries as a group [Desai 1993].

2 Viewing the term as unpatriotic, Dubashi writes: "...I did not expect socialists like Raj Krishna to play the British game and blame the apparent stagnation of India's economy on the Hinduness of India" [Dubashi 1985:2].

3 'The Eighties: A Decade of Change' in *Business India*, December 11-24, 1989, p 52. By 1990, the growth rate would drop to a low of one and a half per cent, a rate which persists at the time of writing (1994).

4 *The Wall Street Journal's* editorial, when Rajiv Gandhi presented his 1985 budget, was titled—Rajiv Reagan! Cited in 'The Budget. A Bold New Approach', *India Today*, April 15, 1985.

5 Most of the growth in industrial output during the 80s was in consumer appliances, and the fastest growing category in the imports bill appears also to have been consumer goods A substantial fraction of the external debt—which grew from $ 7.9 billion in 1975 to $ 20.6 billion in 1980, reaching $ 70.1 billion by 1991—went on consumer goods, Meghnad Desai has argued [Desai 1993: 8-10].

6 Sudipta Kaviraj, in an important argument, has noted that with the Nehruvian emphasis on planning, there was a major focus on English language "information" in the processes of state functioning, which represented a shift from the bilingual culture characterising the nationalist movement [Kaviraj 1990: 68-69]. English came to seem the repository of real nationalism, rather than any of the vernaculars. And with economic development, there came, contra Gellner, a growing cultural differentiation, rather than homogenisation, between dominant English language elites and vernacular 'others'. Attempts by the state at cultural engineering immediately lifted these tensions onto the larger political stage

7 Here I paraphrase an argument made by Todd Gitlin [Gitlin 1980:8].

8 A term recently used to describe Hindutva fascism by Prabhat Patnaik, a description he derives from Michael Kalecki [Patnaik 1993:76].

9 P Sainath notes that 'very large corporate houses' in Maharashtra and elsewhere have been using the Shiv Sena to crush trade unions in their factories. The Reliance group, for instance, has systematically promoted Shiv Sena unions in all its factories to replace the leftist unions within them [Sainath 1994].

14 'Religious' broadcasting was far from unknown on the radio in colonial India, or indeed after independence Festivals, anniversaries and other special events of various communities were regularly observed with programmes suitable to the occasion. However, after a Station Directors' Conference in 1942, it was decided that services of this nature were crowding the calendar, and generating unmanageable demand. Moreover, particular days were coming to be associated with religious programmes of particular communities: Friday for Muslims and Tuesday for Hindus in Delhi, and so on. It was decided that only 'important' festivals should provoke programmes on their behalf; further, regular weekly broadcasts on behalf of any religion were proscribed Until the mid-1980s, this was the operative definition of 'secularism' on Indian broadcasting.

22 Bachelard's meditations on the 'poetics of space' are illuminating in this context. "Memories are motionless, and the more securely they are fixed in space, the sounder they are. Space contains compressed time. That is what space is for. And the space which is paramount for memory is the house.

"Life begins well.. it begins enclosed, protected, all warm in the bosom of the house ..In this remote region, memory and imagination remain associated, each one working for their mutual deepening...[W]e travel to the land of Motionless Childhood, motionless the way all Immemorial things are." Cited in Harvey 1990: 218. The metaphor of Janmabhoomi taps the deepest recesses of the mind, 'where memory mixes with desire', evoking longing for an irrecoverable love and wholeness, and fixing that longing in a secure, delimited space. The associations it provokes clearly go far beyond any ascriptive characteristics of culture or creed.

34 "...Ram mandir construction in Ayodhya will bring good luck to India", declares the banner of one VHP pamphlet, *Warning India in Danger*, n d. The 'good luck' derives, of course, from the sacredness of the site, and from a Ram temple having already inhabited the site before—or so the VHP claim.

35 L K Advani, interviewed in *The Economic Times*, August 10, 1993, p 7.

36 Cited from a 1988 issue of *Organiser* in Bhattacharya 1991: 127-28.

37 Describing their interview with B L Sharma 'Prem', VHP leader and presently BJP MP, after the riots in Nizamuddin, Pradeep Dutta and Sumit Sarkar write: "While he was talking to us about the Hindu and the Muslim, his facial expressions went through revealing changes. The gestures and looks through which the Muslim was portrayed conveyed a hard virile masculinity. While describing the Hindu, his voice and face took on a supplicatingly feminine and helpless expression. When he talked of the ideal Hindu of the future, his face resumed the expression that it wore when referring to the Muslim. The Hindu should, then, become what the Muslim supposedly is—violent and masculine" [Dutta and Sarkar 1994:89].

38 She disclosed that attendance at her talks went up from five to six thousand, to one or two lakhs after this change of theme. Uma Bharati, personal interview, August 1, 1992, New Delhi.

42 The Sangh parivar's own use of media demonstrated a sophistication in communication strategy perhaps never before witnessed in Indian political mobilisation. More could be said in this regard than space allows here—the class-stratified propaganda deployed indicated a systematic understanding of the fractures and fault lines in social ideology, as well as the power of particular symbols and themes to form links across these fissures, to craft broad-based political movements. The broad approach consisted in using a blend of myth and folklore for rural and small-town audiences, and a reliance on 'experts' of history, archaeology and jurisprudence for educated urbanites, using the paraphernalia of scientific research and argumentation. Apart from this, there was the fostering of cottage industries that retailed the VHP message through pamphlets, posters, stickers, buttons, toy 'movie cameras', as well as mass produced books, cassette tapes and videos (Basu et al, 1993: 60-63, 82-83, and 92-109). The formidable influence of the parivar on the press, often working from the level of cub reporters upwards—rather than from the editor downwards, provided a channel of communications that was able to survive or evade even the most 'secular' of editors, and helped to create a climate of opinion in which pro-Hindu ideas appeared in their most favourable light.

Some Issues in the Debate on Policy

Sebastian Morris

The current discussions on the liberalisation programme of the Indian government have found little common ground and have yet to come down to an empirical level where the hypotheses and fears on both sides are posed against facts. An attempt is made here to raise questions which need to be resolved.

THE liberalisation of the Indian economy which began in the early 80s has now accelerated. The content of the reforms announced in 1992, and 1993 go far beyond what may conceivably be attributed to pressure from the World Bank and the IMF. It is no longer possible to see the liberalisation as purely a response to the balance of payments crisis. While effective policy as such has changed more slowly than what the initiatives and intentions would indicate, it is nevertheless true that the pace of change has been rapid, and as never before since the crisis of the mid-60s in the Indian economy.[1]

There is much discussion about these initiatives in the popular press as well as in business and academic journals. The responses and stances of most scholars have been rather predictable. Most, but not all, left intellectuals have vehemently argued against the current initiatives particularly in their equity aspects, and have warned that under the guidance of the Fund/Bank India can go the Latin American way. Some have even argued that the policies of the 80s were in fact designed to bring the Indian economy to the impasse of 1991 so as to ensure the liberalisation of the economy under the Fund/Bank auspices!

Intellectuals closer to the government have on the other hand argued that the system of controls (and subsidies), and in general the superstructure of economic governance and policy had long become dysfunctional, having little bearing on the economic reality either as it exists today, or as had existed in the immediate past. They would demand that discretionary and bureaucratic control of the economy would have to go, to be replaced by price-based measures and eventually to be removed altogether. They have also argued for a trimmer and more efficient public sector, for privatisation of particular sectors, for a concentration of the public sector in its traditional infrastructural areas, and for throwing open sectors hitherto reserved for the public sector to the private sector. Licensing, with the obvious distortions that it has brought about not only in the industrial economy of the country but also in the political process, as well as the pointless nature of much of the provisions of the MRTPA (until its recent amendment), are all supportive evidence in their agenda for change. They would also insist that the economy ought to be opened up for import competition, and for foreign direct investments (FDI). These are claimed to be necessary to make Indian industry competitive. The high growth of the Indian economy in the 80s, which none can now deny,[2] has certainly provided the confidence to government and policy-makers pushing for change. The impact of liberalisation on growth is not quite clear. The traditional determinants of the performance of the manufacturing sector in India, namely, good agricultural harvest, increased public investment and relaxation of infrastructural constraints, may very well have underlined the good performance in the 80s.[3] Some scholars outside the government but not all necessarily left-wing have initially tended to deny the growth in the 80s. Later many have characterised it as being import and luxury goods led, as furthering inequalities, and as leading to a dependence of the economy to the detriment of its long-term prospects for industrial transformation.

The collapse of 'socialism' in eastern Europe and the erstwhile Soviet Union have certainly effected the conduct and content of the debate. The events therein necessarily open up, like unhealed wounds, particularly for the left, the questions of viability and desirability of Soviet style 'socialism' in the LDCs. It also puts the left on the defensive, and has given the right the upper hand in economic and political debates. Today, unfortunately the onus is on the left to argue its case.

The discussions have found little common ground and have yet to come down to an empirical level wherein the hypotheses and fears on both sides are posed against facts.

Is Latin America really relevant? In Latin America and some of the African countries, it is now quite clear that Fund/Bank guidance have brought about BoP adjustment only with great cost in terms of growth and equity. There are obvious differences between India and Latin America. The regular cyclical growth and collapse of the economy were features of Latin American development even before world war II and may not be unrelated to the large amounts of capital flight from these countries. Somehow, Latin America has proved incapable of retaining the surpluses it creates during boom periods for domestic investment. Even gross underestimates[4] of capital flight, would show that capital flight from Latin American countries, particularly during periods of recessions have often been in excess of, or comparable to all capital inflows. This means that despite the relatively high level of development of the economy (as indicated by the sectoral occupational patterns), the unambiguous breakthrough into an advanced capitalist economy is thwarted. Capital flight in these countries takes place as the very rich in these countries have consistently chosen to transfer their earnings abroad to spend and save, since their racial and cultural affinity with Europeans and Americans makes this possible. Other countries in Asia (Japan, Korea, Singapore) and Europe (Italy, Spain, Portugal), besides the 'socialist' countries have come from behind to overtake them. The Indian elite in sharp contrast, but quite like the Asian elites in Korea, Japan, Thailand, and China would hardly find it possible to integrate with the advanced west (since racial and cultural differences stand in the way), so that capital flight from India could never reach the same order of magnitude as from the Latin American countries. It would tend to be strongly correlated with the economic policy and situation, and can potentially be reversed[5] with suitable growth promoting policies. It is quite relevant here, to note that the Chinese bourgeoisie based in south and east Asia, is a principal if not dominant source of foreign capital (including FDI) for mainland China now that China itself is growing very fast under liberalisation.

Currency depreciation and terms of trade losses: Fund/Bank prescriptions to devalue have rightly been criticised for their neglect of the (compositional) effect of simultaneous devaluation in a number of countries at the same time leading to a competitive collapse of natural resource product prices, leading to large terms of trade losses. Yet India with little (or negative) net exports of natural products[6] may perhaps not face the same situation under devaluation as the LDCs in Africa and many in Latin America which are large exporters of natural resources. Indeed when the potential for manufactured exports (given the wide diffusion of modern technology through much of Indian industry, and the low costs), is high, currency depreciation may very well be vital to economic performance and faster growth. Beyond the rhetoric there is little evidence to show that currency depreciation (more correctly correcting the bias against exports, and creating a positive bias for exports) does not work to increase manufactured exports.[7] The recent experience would, to even a casual observer show that manufactured exports have indeed responded to currency depreciation in dollar terms at a time when

demand factors have acted adversely against Indian exports.[8] LDC's exports, more so the manufactured exports of the NICs, have suffered significant terms of trade losses,[9] but on that basis to argue that manufactured exports are either irrelevant or not desirable in the process of industrial transformation, would be invalid. Historically, all LDCs (and late industrialisers via the capitalist mode) do show declining relative prices for exports particularly when they are directed at the already industrialised nations. This is the inevitable 'tribute' that the late industrialising countries pay to the already industrialised for access to the latter's markets. Manufactured exports have a vital role because they help to overcome the demand constraint, and provide for scale and scope economies through which technological upgradation and productivity growth takes place. This means that successful industrialisation via a dependence on manufactured exports, is accompanied by barter terms of trade losses while there are income terms of trade gains.[10]

Manufactured exports and land man ratios: Land (and resource) rich countries—e g, the US, Canada, Australia, Brazil, Indonesia—can afford to make do with little or no surplus on manufactured goods, but not India for which Korea and Japan holds the mirror in which we may see her future on this score. Japan exports five to six times as much manufactures as it imports, Korea four times, against the UK and the US which today export less or only about as much as they import. India in the 60s (at levels of income about fifty to a hundred times less than that of the US) was already exporting about as much manufactured goods as it was importing.[11] Since the Mahalanobis period had brought about a diversification of the economy by the mid-60s, India unlike most low income LDCs was a net importer of raw materials and natural products, and in certian years a net exporter of manufactures. It is only India's very low levels of income that has kept its demand for natural resources rather modest. For the continuance of even the moderate growth of the 80s, manufactured exports are necessary, not so much for capital goods imports but for raw materials including energy.

State direction vs *laissez-faire*: The Fund/Bank thesis that 'open' economies have generally grown faster has been criticised on conceptual, methodological and empirical grounds.[12] Others have argued that the east Asian economies show that it is high quality state intervention in all aspects of economic development including an active intervention on the trade front that underlie their success. Despite these criticisms the Fund/Bank have continued to be guided by such *laissez-faire* thesis. Indeed the Fund has increasingly become 'monetarist' in its approach. Its critics while always calling attention to the extent of state intervention in Korea and other better performers such as China have not generally recognised that the nature of state in India would impose limitations in terms of the quality and the extent of its intervention, and hence of what is feasible.

Employment growth, wage rates and equity: Since the mid-60s employment growth in industry has been tardy.[13] And even in the 80s despite good growth in output it is apparent that employment growth in the organised sector (excluding the public sector) has been woefully inadequate. Employment growth in the public sector seems to be a dysfunctionally autonomous process with little bearing on either output and productivity growth, or on capital formation in the sector. Suitable policies, that can retard real wages growth in the organised sector while increasing public and private investment, could possibly increase employment and lower the capital intensity of that sector. The unorganised sector, where the wages are low and militancy entirely absent, despite capital and policy constraints, has absorbed labour at a rate that has exceeded 4 per cent per annum.[14] This fact points to a potentially complex relationship between liberalisation (with its possible wage reducing effects in the organised sector, particularly under Fund/Bank auspicious) and employment growth. In the context of transformation, static equity considerations are devoid of meaning. Equity in the Indian context of large disguised, unemployment becomes largely equivalent to employment growth. Successful 20th century industrialisation whether of the dynamic NICs or the 'socialist' economies has been based on low wage rates, until such time as the disguised unemployment is overcome.[15]

Poor performance of India: Many of the south-east Asian economies whether well-endowed with natural resources (e g, Malaysia, Indonesia), or not (South Korea, Taiwan, Singapore, Hong Kong), and others (the Philippines, Thailand) in a more intermediate position have been better growth and employment performers than India. They may well be better performers even in equity—certainly true of south Korea, Taiwan and Singapore—than India, despite their authoritarian regimes fully wedded to capitalist growth. Even Sri Lanka has shown better growth performance than India. All of them have done far better than India in terms of physical quality of life indicators too.[16] India despite the notable achievements during the Second and Third Plan periods, and the rhetoric of 'socialistic pattern of society' has been a society with much inequality and low growth. (Inequality in India may be much worse than what is generally believed if the incomes, and the rents the very rich earn were truly included for the estimates.)[17] Only in comparison to war-torn Indo-China, obscure Burma, Nepal and Bangladesh does India's performance in Asia seem respectable. The need for change therefore can hardly be disputed, and so the debate about the content of the changes becomes very important.

Indian 'narodniks': The left and the Indian 'narodniks' (under which we might include Gandhians, Lohaites, alternative-development schools, many of the conservationists and environmentalists, non-Marxist radicals of various shades) have easily made the dichotomy between growth and equity: There is an enormous literature in India that sees growth as disturbing, as affecting the poor for the worse, and as bringing about social inequity. The widespread acceptance of such a thesis among intellectuals and activists alike is no doubt due to the slowness of Indian growth, which has made the beneficial effects of growth less observable, while the adverse effects on the poor marginalised sections (poor slum and pavement dwellers in the cities, tribals in areas subject to ecological and other dangers) glaring.[18]

'High speed growth': High speed growth (as in Korea, China, Thailand and Taiwan) has certainly meant that even the poor gain. With China having grown at a searing pace of about 8 per cent for now nearly a decade and a half, it is hardly possible to argue that large countries like India have to accept relatively slow growth. In Korea where investment rates have been very high, and disguised unemployment eliminated by the early 70s, the inequality of consumption expenditure (which is the relevant measure) has been less than of income. Even on the basis of income it is much less than in most other countries in Asia. Indeed if much of profits are invested to create employment opportunities, the notion that surplus value (profit) is at the cost of exploiting labour while quite true technically, may lose much of its political and social implications during the phase of high rate of capital formation.[19]

'Transformation' rates of growth: More importantly, we are led to the notion of transformation rates of growth. Countries which have industrialised late have grown at faster rates than the early industrialised to catch up with them. Does this mean that the LDCs when they are on their way to industrial transformation today, necessarily grow very fast? And therefore slowly growing LDCs (say below a certain empirically determined rate) are not really transforming themselves into industrial societies?

Demographic transition: From a population perspective, it is well known the birth rate declines when a certain level of income which is much above India's income today is reached. Economic growth at low rates (up to a per cent or a half above population growth rates) can postpone indefinitely or considerably slow down the demographic transition, keeping much of the Indian population very poor. Fast growth much above population growth rates on the other

hand, particularly when accompanied by an agrarian revolution (greatly increased agricultural production that follows type II land reforms),[20] in raising the modal income brings about the demographic transition, so that the poverty trap and all the ills that go with it are overcome once and for all. To put the argument in a nut-shell, the empirical evidence would indicate that the escape route from underdevelopment is to grow very fast on a sustained basis, and anything else may prove ephemeral.

Today when left refuses to be acutely aware of the vital differences between 'high speed' growth and the sluggish growth that characterises much of the LDC experience, they are denying the spirit of their own tradition which always argued for growth and the release of productive forces. Indeed the Marxist arguments for the transition from feudalism to capitalism, and from capitalism to socialism are essentially based on the need to break down the barriers that stand against productive forces and the proclivity of the system to do so. With the benefit of hindsight it is possible to conclude that the 'socialist' states of the USSR and eastern Europe were on the ascendancy until about 1970 or so, because of their essential functionality in bringing about high speed growth, that clearly was able to successfully transform these societies into industrial, whatever may have been the political and social costs, and without an essential dependence on external markets. When the same political and economic structures proved incapable or grossly inefficient in bringing about the further transformation to an advanced industrial society, they collapsed or had to be given up. Poor performance of the agricultural sector in the USSR, since the late-60s, while important is only a specific aspect of the system's failure. When the task of industrial transformation is still unfinished in China, the functional need for capital formation, at a high rate to make possible the continuance of 'high speed' growth, means, that the state's centralised direction, has relevance. To that extent Chinese 'socialism' is still 'acceptable'. Thus it would indeed be strange if the left were to come close to the 'narodniks' in arguing against "high speed" growth. Then they would have to live with the contradiction of pushing for social and political development without economic transformation.

Limitations of radical politics: Conceivably, the left could argue for radical political change of the type brought about by the October Revolution, in India, and to depend upon the new society to carry out capitalism's unfinished tasks. But its own experience (including that of the 'naxalites'), now for about 50 years would indicate that:

(1) The state still commands great legitimacy, and so the insurrectionist-putsch strategy of Lenin is only a remote possibility.

(2) The long-march strategy of Mao while seemingly feasible, given the wide disparities in rural India, may also not really be so, due the rather numerous class of 'rich' peasants (and even the leaders among the poor who have access to the state's bounty in the form of IRDP type grants and loans), who have gained under the present system; and the lack of a tangible equivalent to China's Japanese invaders.

(3) The growth of the 'middle' class[21] has been rapid, so that today their role in politics is quite important, and can be a crucial barrier to the success of radical politics.

(4) Its own performance has been very poor: The left's strategic blunders in supporting the British war effort during the second world war, its tendency to divide itself based on the ideological battles in the USSR and China, its petty bourgeois orientation which has prevented the dominant streams within it to organise the unorganised workers, have proved most damaging. The mainstream left has all along only competed for the organised workers' attention who have little potential for the kind of radical political action necessary for socialist revolution, since like the English workers commented upon by Marx and Engels (particularly), they do constitute a privileged section who may stand to lose a lot more than their 'chains' in the event of a radical transformation of state and polity. The large mass of the unorganised workers (whose interest could very well contradict with the organised workers), with revolutionary potential, remains a divided lot, easy victims of divisions along caste, religious, and communal lines. The few movements for change among them have been largely localised, so that the state has found it very easy to contain and manage them. It is only the agricultural labourers, and that too in a few areas with high growth (coastal Andhra, Punjab, Haryana), and in Kerala who have been organised, but their struggles have as yet to add up to anything worthwhile in national political terms. In contrast broad-based fronts of landlords, rich and middle peasants, have been quite successful in co-opting the small peasants, and have found national political expression as the following and success of peasant leaders like Charan Singh, Sharad Joshi, and others would indicate.

(5) The left as also centrists parties like the Congress have not been able to read the undercurrent of strong nationalism among the Indian people. Their attention has fallen short on the very visible quarrels along language, creed and caste lines. The result has been that Hindu chauvinist groups were left free to give their own interpretation, and perhaps even the form to this undercurrent.[22]

Revolutionary praxis and nationalism: It is understandable and not at all strange that left movements that have succeeded (ignore the 'revolutions' in eastern Europe that were to a large extent imposed upon by the Soviet state)—China, Cuba, Vietnam, Russia, were all based on the recognition of nationalism as an autonomous force; quite against the grain of the 'pure' left ideology. Abstract Marxist theory in not recognising nationalism as a force autonomous to class struggle is to that extent unreal and distanced from policy and praxis, in today's world of competing nation states, with vast differences in their level of well-being and development.

Only when the slogan workers of the world unite was *de facto* interpreted as workers(poor) of Vietnam or China unite did revolutions succeed. The quite obvious observation that the workers of say the US (however enlightened and educated in the correct ideology) have little in common with the vast masses of the poor and starving workers of say India, was denied systematically by Marxist theoreticians.[23] Growing evidence of racial attacks by white workers of non-white (immigrant and other) workers, and the fact that the workers from the advanced capitalist countries were at the forefront of protectionist campaigns against imports from the LDCs, never made it far into the cognisance of Marxist theoreticians. The thesis of dependent development, and the world systems approach suggests that the value theory in the form that Marx presented, can hardly be valid for open-economies[24] when there is surplus transfer across national boundaries. Hence there is the possibility that workers in the advanced capitalist countries benefit from the 'monopoly' position of their nations' capital. Emmanuel's work[25] points to the 'unequal' exchange between nations, but its implications for the praxis have not been widely recognised. Nor are its profound implications for the theory of exploitation widely recognised. This would mean that Marxists rethink their idea of a fundamental contradiction between capital and labour in the present context.

Liberals and high speed growth: Liberals, as also the state in India have shied away from consistently aiming for high speed growth. Good growth was achieved during the 'Mahalanobis period' i e, 1955 to 1965, and again in the 80s, when in several years growth in fact exceeded plan projections. The state in India has been particularly sensitive to the interests of the middle classes. It has always preferred to put the brakes on the economy, rather than allow inflation at levels higher than about 12 per cent to accompany growth. Most political parties are averse to inflation because it is claimed to hurt the poor But they may be more

concerned because inflation unambiguously hurt the 'middle' classes and the voice of the poor remains unarticulated except in terms provided by the middle classes. High speed growth even when accompanied by inflation (of the type seen in the transforming economies of south-east and east Asia), because they are accompanied by labour absorption and the dissipation of disguised unemployment can very well be pro-poor.

The above perspective would lead us to believe that the current liberalisation would be constrained by the balance of class forces and the nature of the state so that in all likelihood it would sacrifice growth for 'low' levels of inflation; public (and private) investment for public and private consumption expenditure. Already public investment has suffered more than consumption expenditure in the 'structural' adjustment.

The enchantment with the east Asian model on the part of the government pushing for change, and of liberal scholars has not yet translated to a systematic and consistent programme of action: While many would agree with them that the quality of state intervention in India has been poor and costly, and has increasingly tended to be dysfunctional, and therefore in need of an overhaul, the other vitally necessary conditions for a successful transformation, obtained in those very east-Asian societies, have been brushed aside: We would like to call attention to two very important social questions—land reforms and the behaviour of entrepreneurial capital.

Land reforms as a capitalist strategy: It is well recognised that type II land reforms were obtained in these rather densely populated societies, along with agricultural output expansion at about 5 per cent, while they moved on to high speed growth. It allowed the absorption (in Korea for example) or as much as 80 per cent of the increased industrial output between 1965 and 1979, during its so-called 'export-led-growth'. Can India really achieve high speed growth on a sustained basis without land reforms? Today we know that the Mahalanobis type of planning could not be pushed far because *inter alia* one of the necessary conditions for success viz, land reforms, and following from it increased agricultural output were not obtained.[26] The strategy had to be given up; with much slowness no doubt. We may characterise the period from 1965 right up to 1979 as one of anomie. Attempts at liberalisation during this period were feeble and had to be quickly reversed.[27] Two wars, the naxalite upheaval, a serious of poor harvests, emerging fissiparous tendencies, and the complex balance of class and regional interests that the Indian state represents, meant that it could hardly change direction as quickly as in Korea and Taiwan, or even in China, where the autocratic rule of the party means that a battle won within the party is a battle won nationally.

If liberalisation is about bringing the industrial transformation (at high speed growth), then liberal scholars, and the government would have to at least answer the question of how the home market is to grow. The left's criticism of the state in being only rhetorical about land reform remains its most valid critique. Thus far, the government of India has refused to see (beyond of course the rhetoric) type II land reforms as a necessary condition for the capitalist transformation of society. Instead it hopes for what has never happened: the external market providing the basis for growth.

The Indian state in contrast to the east-Asian state: Central to the east Asian model is discipline. It is by now well recognised that a disciplined labour force is vital to the pursuit of industrialisation, particularly in its external market orientation; and that the state's role in bringing about this discipline was crucial. What is less understood and appreciated is the state's role in disciplining the entrepreneurial classes and firms, which had the effect of ensuring that much of the surpluses were in fact invested leading to the virtuous circle of growth.[28] Terms of access to finance and more so its centralised allocation, the functionality of which was ensured by the discipline accepted by firms, was also vital to the success of the state's direction at very low cost.[29] There was little or no diversion of funds provided by the state to more privately remunerative activities, but with little potential to increase societal growth.

The Indian state is contrast has found direction of the economic effort far too costly. Only partly is the high cost attributable to the kind of instruments[30] it has chosen to use: direct and quantitative controls, and bureaucratic and administrative management, in contrast to working via the market and through incentives and prices. That these dysfunctional and/or costly instruments have to change is widely appreciated. Much of the higher cost apparently arises from the state's very nature—its inclusive rather than exclusive character. Thus while the public sector were closer to models of efficiency and effectiveness in Korea, in India, the emergence of the illegitimate need to serve many masters, has taken them far from their primary task of leading the society through its industrial transformation. Well designed institutions and methods for resource allocation, monitoring and direction have been 'corrupted' and rendered dysfunctional as hidden and not so hidden agenda, beyond growth and transformation, have emerged. This is the politics of accommodation. The efficiency of the bureaucracy is much attenuated and it can be a significant drag even when the politics unambiguously demands change. The Indian state's limited capacity to direct the market cannot simply be seen as one of widespread graft and corruption. A worthwhile policy in this context would have to recognise the limitations that emerge from the nature of the state, and build upon the unique spaces and opportunities that the state creates for action. There is no doubt danger here: If we interpret feasibility narrowly, then we may well end up supporting the status quo. It is here where a true understanding of the nature of the state, and of its potential for change, and of the spaces it creates, or could create with political leadership, vital.

As we said before the beginnings of liberalisation in the 80s found a nurturing environment in the growth during the period, but this was hardly based on a total consensus within the Congress. Yet the opposition to liberalisation as it has occurred so far, seems to have come only from rather small (but vociferous) sections of society. This does point to the possibility that of consensus being forged by the section of the elite pushing for change. Their success would depend upon their willingness to address national rather than sectarian interests, and the political will to arrest the eroding legitimacy of the state: and land reform would be the key ingredient for success.

Notes

1 The crisis of the Indian economy ever since it underwent a severe recession in the mid-60s has been a major topic of debate. The so-called 'stagnation debate' that followed (much of it in the *EPW*) brought forth competing theses about the nature of the Indian economy and the state, that ranged from a characterisation as semi-feudal to one no different from any other capitalist economy, which only awaited the right (liberal) policies for growth to take-off.

2 R Nagaraj (1990): 'Growth Rate of India's GDP, 1950-51 to 1987-88: Examination of Alternative Hypotheses', *Economic and Political Weekly*, June 30, pp 1396-1403.

3 R Nagaraj (1991): 'Increase in India's Growth Rate', *Economic and Political Weekly*, April 13.

4 Cf Table 1 of Manuel Pastor, Jr (1990): 'Capital Flight from Latin America', *World Development*, Vol 18, No 1, pp 1-18; or Table 2 in Dieter Duwendag (1988), 'Capital Flight from Developing Countries', *Economics*, Vol 38, pp 26-59.

5 The ratio of capital flight to foreign borrowing for India (Dieter Duwendag (1989)) for the period 1970-83 was very high (approximate 40 per cent) rivalling that of Latin America. This may seem to

belie the distinction between India and the Latin America drawn in the text. But we would still maintain that while the capital flight from India is essentially for economic reasons, that from Latin America has a social and cultural basis as argued in the text.

6 Ratio of exports of natural resources to their imports has averaged about 65 per cent, and has sometimes been as low as 40 per cent, since 1969.

7 The response of Indian exports to policies like currency depreciation or devaluation that seek to remove or lower the bias against exports would not come up against the limitations of the 'one-price' assumption pointed out by Lance Taylor and others. (Cf Lance Taylor (1983), *Structuralist Macroeconomics*, Basic Books, New York.) Given the great variety of Indian manufactures, there always is a set of products whose exports are constrained by the lack of remunerative prices abroad in relation to domestic market realisation

8 Dollar exports to the hard-currency areas in 1990-91 increased by over 10 per cent, even as the exports to the eastern block declined due to developments quite external to the economy. Their slow growth in the year 1991-92 can perhaps be related to the severe supply interruptions and constraints during the year.

9 See for instance Box Figure 5.5(b), *World Development Report*, 1991, World Bank, Washington.

10 Even developing countries as a whole have made large income terms of trade gains, since 1965 (ibid). And these are due largely to the dynamic NICs. China's purchasing power parity based income at about US $ 2,700 in 1987 is about six times its exchange rate based per capita income. For India it is only three times. See World Tables, 1987 and the World Penn Tables, Mark 5. This means that the yuan has been much more aggressively priced than the rupee. It also tells that China is willing to suffer the terms of trade losses that goes with the undervaluation of its manufactured exports for the advanced country market access, without which it would not have taken place in the first place. Korea too during its phase of transformation subsidised its exports in many ways including undervaluation of the won.

11 The World Tables 1989 of the World Bank shows this.

12 Cf Ross Levine and David Renelt (1991), 'Cross-Country Studies of Growth and Policy: Methodological, Conceptual and Statistical Problems', WPS, No 608, March, World Bank, mimeo for a critique of the large number of cross-country regression studies upon which much of the support for the Fund/Bank's thesis is based. A meaningful concept of 'openness' would have to adjust the trade/gdp ratio for the dependence of this ratio on structural factors of size, and stage of development. See Sebastian Morris (1993), 'Structural Determinants of Openness of Economies: The Conceptual Basis and Evidence', IIMA Working Paper, No 1086. Outward orientation in the sense of manufactured export promoting regimes (not *laissez-faire*) does show a positive relationship with growth, particularly in land-scarce economies.

13 Planning Commission, 'Employment Growth in the 80s', mimeo, 1990.

14 The 'middle sector', viz, the all non-household manufacturing employment (as per the Census data) minus the Census Sector of the ASI grew at this rate. Mridul Eapen and A Vaidyanathan (1984), 'Structure of Employment in Indian Industry: Some Findings from Census Data', Centre for Development Studies, Working Paper No 199.

15 Mahalanobis recognised this aspect to justify the use of wage and excise taxes to raise resources for investment. See P C Mahalanobis (1963), 'The Approach of Operational Research to Planning in India', *Indian Statistical Series*, No 18, June 29, Calcutta, India.

16 Cf Social Indicators of Development, 1991, World Bank.

17 There are various estimates of 'black money' in India. Whatever the correctness of these estimates, no one would deny its increasing size. Official NSS data, upon which ultimately all income inequality estimates are based totally misses out the really rich. Suraj B Gupta (1992), *Black Income in India*, New Delhi, Sage, has estimated that the national income is underestimated by as much as 50 per cent. This figure is quite likely to be on the high side, but even at half that level, the estimate would be consistent with the estimate of capital flight from the economy at a level of 1.5 to 2 per cent of GDP.

18 Ideas which originate in the west can and do find root among intellectuals in third world countries, a process that is not particularly dependent upon the relevance of those ideas to the economic and social situation in the host country. Sometimes this speeds up social and economic development as for instance the Bengal Renaissance, but at other times they could be dysfunctional.

19 Until the late 70s (real wages started rising in Korea in the mid-70s), most working class Koreans outside Korea were highly critical of the regime in South Korea, while being sympathetic or ambivalent towards the North. As the facts of the North have become better known, and as South Korea has continued to grow rapidly, while the North itself has stagnated, attitudes have changed. The current agitation for democracy in Korea is entirely political and does not question the basic logic of capitalist transformation that Korea has undergone.

20 Type I and type II land reforms were meaningful categories in the analyses of Japan's economic transition, and are relevant today in the case of densely populated Asian economies as well. Type I land reforms where the overlords on land (zamindars, feudal lords, etc) are overthrown have been found to be insufficient for the industrial transformation of these societies. Japan carried out such reforms as early as in the late 19th century. India, immediately after independence. Type II land reforms entail the transference of land to the actual tiller. This was carried out in Japan and Korea under the US occupation after WWII. India still awaits its type II land reforms. The categories of type I and II land reforms are from R P Dore (1965), 'Modernisation of Japan: Land Reform and Japan's Economic Development', *The Developing Economies*, Vol 3, No 4, December, pp 487-96.

21 The popular press has often assumed the present size of the middle class to be about 150 million. In a democratic society even at 100 million, and when the rest are wretchedly poor, they would exercise much influence, especially when the members of the class are widely dispersed in society.

22 The underlying reason for the BJP/RSS's ascendency is the recognition of this as yet unformed force. They have of course attempted to give an exclusive Hindu form to this, nationalism, which therefore excludes others. The point is if a centrist party like the Congress or even the left had recognised this strong undercurrent and addressed it on inclusive terms, the present enchantment of the people with the BJP and its allies could not have come to pass.

23 Cf Ernest Mandel, 'On the Revolutionary Potential of the Working Class', c 1976.

24 The further development of the Marxist model, as Marx himself envisaged (his method of successively introducing aspects of the reality and reworking to see if they fundamentally changed the 'laws of motion' based on the more abstract model), opening up his system to trade, to reconsider the law of value, and the law of the falling rate of profit.

25 A Emmanuel (1973), *Unequal Exchange*, Monthly Review Press.

26 Even a casual reading of Mahalanobis would draw one's attention to the importance given to land reform for the success of his strategy. P C Mahalanobis (1963), op cit.

27 These alternated with sharp swings to the left, which may not have been entirely rhetorical. With the nationalisation of the banks, the MRTP legislation and the nationalisation of the coal sector, and the abolition of privy purses, Indira Gandhi 'stole the thunder' from the left, just as much as Nehru did in the 50s with planning and the public sector.

28 Careful scholars like Mrinal Datta-Chaudhuri have made this point early, but it has taken its time to reach the cognisance of many others. For a recent comprehensive and eclectic study see Alice Amsden (1989), *Asia's Next Giant: South Korea and Late Industrialisation*, New York, Oxford, Oxford University Press. Mrinal Datta-Chaudhuri, 'Industrialisation and Foreign Trade: The Development Experiences of South Korea and the Philippines' in Eddy Lee (ed) (1981), *Export-Led Industrialisation and Development*, International Labour Organisation.

29 This is also true of Japan. For the case of Korea see Chung H Lee (1992), 'The Government, Financial System, and Large Private Enterprises in Economic Development of South Korea', *World Development*, Vol 20, No 2, pp 187-97.

30 The instruments of governmental control have been the focus of attention in many inquiry committees, and in the studies by concerned scholars.

Schedule 17—Notes on Accounts

I. Principal Accounting Policies

1 General:
The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country..

2. Transactions involving Foreign Exchange:
- i Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year except foreign currency deposits under certain schemes which are translated at notional rates Non-monetary assets have been carried in the books at the contracted rates
- ii. Income and expenditure items have been translated at the exchange rates ruling on the date of the transactions.
- iii Outstanding forward contracts have been revalued at the forward exchange rates prevailing at the close of the year.

3. Investments:
- i. The investments in approved securities are classified into "Permanent" and "Current" investments in terms of guidelines of Reserve Bank of India.
- ii. Permanent investments are valued at cost
- iii. Current investments have been valued at lower of cost or market value. For the purpose of valuation Reserve Bank of India/Stock Exchange quotations where available have been taken as market rates, and where the rates are not available, the same have been valued as per norms laid down by Reserve Bank of India as under:

a Government Securities and PSU Bonds	Valued on yield to maturities (YTM) basis
b Treasury Bills	Valued at carrying cost

- iv The broken period interest on purchase/sale of securities is treated as capital outlay/receipt.

4. Advances.
- i. Provision for bad/doubtful advances is made on the basis of the asset classification and provisioning requirement thereof under the prudential norms laid down by the Reserve Bank of India in respect of all non performing assets including those with outstanding balance of less than Rs 25,000/- per borrower. Advances secured by Financial Guarantees of public sector banks are not considered "Non Performing Assets"
- ii. Further provision is made for doubtful advances in respect of other advances based on Management's estimate of potential exposure
- iii. Provisions in respect of doubtful advances have been deducted from advances to the extent necessary and the excess has been included under "Other Liabilities and Provisions".
- iv. In consortium advances, the accounts are classified as per the decision of the lead bank.
- v. Advances are shown net of bills discounted with the Financial Institutions.
- vi. Interest on non-performing advances is accounted as per the guidelines of Reserve Bank of India with reference to realisation

5 Fixed Assets.
- i. Fixed assets are accounted for at their historical cost
- ii. Depreciation is provided for on the written down value method at the rates prescribed in Schedule XIV of the Companies Act, 1956

6. Staff Benefits:
The liability for gratuity to staff has been computed on actuarial basis and paid to the approved Gratuity Fund of the Bank

7. Net Profit:
The net profit disclosed in the Profit and Loss Account is after-
- i. Provision for taxes on income in accordance with statutory requirements
- ii. Provision for non-performing advances.
- iii. Provision for Head Office administration expenses
- iv. Other usual and necessary provisions.

II. Changes in Accounting Policies.
1. Provision for advances with individual outstanding of less than Rs. 25,000/- has been made this year at 5% of the aggregate amount outstanding as per the prudential norms laid down by the Reserve Bank of India as against 2.5% in the preceding year.
2. Income on non-performing assets with individual outstanding of less than Rs. 25,000/- has not been recognised in view of the prudential norms laid down by the Reserve Bank of India.
3. Identification of Non-performing assets has been done as per the revised guidelines of Reserve Bank of India.
4 The impact of these changes on operational results for the year is not material

III. Revenue and Other Reserves.
1. Include Head Office Reserves of Rs 33,255 (000's) which represents funds remitted by Head Office/retained from repatriable profits to meet the cost of acquisition of residential premises, deposit/advance licence fee of Bank premises at Bombay, etc. as per guidelines of Reserve Bank of India.

IV The previous year's figures have been regrouped/rearranged wherever necessary.

Auditors' Report on the Accounts of the Bombay Branch of Abu Dhabi Commercial Bank Limited

We have audited the attached Balance Sheet of the Bombay Branch of Abu Dhabi Commercial Bank Limited (incorporated in the United Arab Emirates with Limited Liability), as at 31st March 1994 and the Profit and Loss Account of the Bombay Branch of the Bank for the year ended 31st March 1994 annexed thereto.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with the provisions of Section 211 and Sub Section (5) of Section 227 of the Companies Act, 1956.

We report that:

(1) we have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of the audit and have found them to be satisfactory;

(2) the transactions which have come to our notice have been, in our opinion, within the powers of the Bombay Branch of the Bank;

(3) in our opinion, proper books of account as required by law have been kept by the Bombay Branch of the Bank so far as appears from our examination of these books;

(4) the Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account;

(5) in our opinion, and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, read with notes there on, particularly Note II regarding changes in accounting policies give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and give a true and fair view of the state of affairs of the Ihdian Branch of the Bank as at 31st March 1994 and of its profit for the year ended on that date.

Beyond the Law and the Lord

Quality of Private Health Care

Sunil Nandraj

Although the private sector in health care is large and growing, it is poorly regulated with hardly any regard to quality of care.

THE World Bank paper on 'Health Financing in India' and the 'World Development Report 1993' advocated privatisation and liberalisation of the health sector. How relevant are these policy prescriptions for the Indian context? What exactly is the nature of the private health sector in India? What are the regulatory and monitoring mechanisms and their implementation in this sector?

The private health sector is a large and important constituent in the country's health care delivery system. The share of the private health sector in India is between 4 and 5 per cent of the gross domestic product. This share at today's prices works out to between Rs 16,000 crore and Rs 20,000 crore per year. India probably has the largest private health sector in the world [Duggal and Nandraj 1991]. This sector has enlarged greatly in the post-independence period, especially in the 80s. A substantial financial burden of households is for meeting health care needs.[1] This gains significance when we realise that nearly half the country's population does not have enough resources to meet its food requirements. Compared to state expenditure on health the private household expenditure is nearly four to five times more than that of the state [Duggal and Amin 1989].

Extent of Private Practice

Data on sectoral distribution of doctors is not easily available because many states do not file the required information in the ministry of health. A study conducted in 1963-64 by the Institute of Applied Manpower Research showed that out of a total of 1,00,189 doctors 39 per cent of them were in government service and 61 per cent doctors in the private sector of the allopathic system of medicine. Out of those in private sector 88.4 per cent were self-employed and 11.4 per cent were employed in the private health establishments [Jesani and Ananthraman 1993]. A study in Ahmednagar district, Maharashtra identified a total of 3,060 doctors belonging to all systems of medicine in the district, of whom 92 per cent were in the private sector (including a very small percentage in the voluntary sector). Of the 3,060 identified doctors, 91.5 per cent were general practitioners and 8.5 per cent were specialists, information not being available for 10 per cent of the doctors. Of the total doctors identified 51 per cent were in urban areas and the rest in rural areas. In urban areas, GPs constituted 77 per cent and specialists 13 per cent while the degrees and specialisations of 9 per cent of the doctors were not known. In rural areas, 85.5 per cent were GPs, specialists constituted only 1.8 per cent and the information on 11.9 per cent was not available. Further with regard to a break up of specialists out of a total of 234 specialists, 22 per cent were gynaecologists, 20.5 per cent were surgeons, 12 per cent were physicians, 10 per cent were pediatricians, 7 per cent were ophthalmologists, 6 per cent were anaesthetists, 5 per cent each were dermatologists and orthopaedics, 4 per cent were ear, nose and throat (ENT) specialists, 2 per cent were psychiatrists, 6.5 per cent fall in the category of others (includes radiologists, pathologists, cardiologists, plastic surgeons, physiotherapists) [FRCH (a) 1993].

Practitioners also consist of those having dubious qualifications and degrees or having no qualifications at all such as those who have worked as helpers, compounders or assistants for other doctors for a period of time and have picked up the skill in the process. In this category sometimes spouses of doctors are also included, who sit in the clinic when the doctor is away. Also included in certain cases are the sons/daughters who 'inherit' the practice of their parents. A study conducted in Madhya Pradesh showed that of all those treated by private facility, 52.24 per cent of the illness episodes in rural areas, 17.83 per cent in urban areas were treated by licentiates/RMPs [George, Shah and Nandraj 1993]. The extent of quackery can be gauged from the advertisements which appear regularly in leading newspapers of the country for cure of various illnesses. The decay is so bad that posters are displayed openly at local railway stations of Bombay urging people to become a doctor.[2] In Maharashtra the government appointed a committee to look into the matter of quacks and take action against them. With the help of the public health machinery at various levels, 4,971 bogus doctors were identified and the list sent to the state and police authorities for further action *Sampark*, August 1993. Till date no action has been taken on the report.

In India, during 1974, 16 per cent of the hospitals and 21.5 per cent of the hospital beds were in the private sector and rest were in the public sector. This proportion increased in 1990 to 57.95 per cent of the hospitals and 29.12 per cent hospital beds in the private sector. There are reasons to believe that the number of hospitals in the private sector is much larger than what the available data suggests. According to data in *Health Information of India* 1992, there were only 1,319 private and voluntary hospitals in Maharashtra, and the *Directory of Hospitals* brought out by the ministry of health listed 1,174 hospitals in Maharashtra. But the Bombay Municipal Corporation listed 907 private hospitals and nursing homes in Bombay city alone (excluding Thane), on the basis of its registration data which again is an underestimate. Another instance of under reporting of data is brought out by a survey undertaken by Andhra Pradesh Vaidya Vidhana Parishad, which found the existence of 2,802 private hospitals and 42,192 private hospital beds in Andhra Pradesh in 1993.

According to data available with GOI as on January 1, 1991, however Andhra Pradesh had only 266 private and voluntary hospitals and 11,103 private hospital beds (*Health Information of India* 1991). The survey also showed that 67.60 per cent of the private hospitals were located in urban areas (which were state capital, divisional HQ, district HQ and taluka HQ). The bed: population ratio in the private sector was 6.37 beds per 10,000 population and in public sector 5.12 per 10,000. Ahmednagar district, Maharashtra had 274 hospitals and nursing homes in the district, of which 82 per cent were privately owned, 7 per cent by the public sector and 4 per cent by voluntary-missionary agencies and 7 per cent not known. The response to the mailed questionnaire from 90 hospitals showed that there were a total of 2,241 beds and the private hospitals accounted for 1,050 beds [FRCH (a) 1993].

The above data suggests that the size of private hospitals is much larger than official data brought out by the government. Secondly, that indoor care provided by private hospitals is much larger than public hospitals and this growth has taken place mainly in urban areas. The increase has occurred not so much because private hospitals are better equipped, more efficient and manned by better qualified and more humane staff as because public hospitals have simply failed to keep pace with the demand and have been starved of funds, are

neglected and run down.

A recent development in private health sector has been the growth of corporate hospitals, rightly termed 'medical industrial complex' [Relman 1988]. In 1983, the first corporate hospital in India was set up in Madras. It was established by Apollo Hospitals Enterprise (AHEL), which within five years had recorded a turnover of Rs 11.48 crore and a net profit of Rs 1.66 crore. Many corporate houses and non-resident Indians have recently joined this enterprise, e g, Hindujas, Escorts group, Standard Organic group, Surlux Diagnostic centres, United Breweries group, Goenkas, Birlas and the Modis. In a span of two years, 1984 to 1986, over 60 diagnostic centres have entered the market with an investment of over Rs 200 crore in sophisticated equipment. Today Bombay has 13 body scanners, Delhi 11, Madras eight, Calcutta three, Hyderabad two, Pune three and Ahmedabad three [Jesani and Ananthraman 1993]. Each of these cost Rs 6 crore a piece. The United Group owns over 32 body scanners and 14 brain scanners in the country (*Indian Express*, May 18, 1989). Suffice to say that with the rise of the corporate sector, the cycle in health care does not start with a trained medical person and a sick person in search of each other, but with an investor in the share market in search of a profitable investment: the availability of newer medical technology and a market in medical care being merely an attractive form of investment [Phadke 1993].

Most of the big corporate and trust hospitals are concentrated in metropolitan cities. Many of them register themselves as trust hospitals with a view to getting various benefits from the state and escape various taxes.

Quality of Private Care

Only recently has attention been focused on the serious anomalies with regard to the functioning and quality of care being provided by private practitioners. This was possible because a number of cases of medical malpractice and negligence filed in the court of law by the victims and their relatives as well as due to the role played by the media and different consumer organisations.

For specialised treatment like hospitalisation and investigations, the GP usually refers the patient elsewhere. Informal discussions and meetings with private doctors revealed that in metropolitan cities like Bombay, Delhi, Calcutta, etc, and also in smaller urban areas like Ahmednagar, Nasik, Pune there is a form of 'cut-practice' operating. For referrals made, a part of the fee charged to the patient is given to the referring doctor. A GP/consultant gets a cut if s/he refers a patient to a consultant, hospital/nursing home, laboratory, diagnostic centre, etc. In Bombay, the cut-ratio is as high as 30 to 40 per cent of the fees charged. As per a new system which has started operating, if a consultant wants to start practice, s/he should deposit a certain amount of money with the local GP for referrals to be made by him/her. In some towns of Maharashtra informal associations of doctors have standardised the ratios of cuts to be given. Recently in a suburb of Bombay the GPs exerted pressure on the owners of private hospitals/nursing homes to increase the ratio of the 'cuts'. Cut-practice operates with everybody's knowledge but there has been no documentation or study of this aspect. Cut-practice inevitably leads to unethical and unnecessary investigations, referrals, hospitalisation, high costs, etc. For those doctors who want to practice ethically and rationally survival in this atmosphere is difficult.

The technical/medical knowledge of doctors regarding treatment being provided to the people needs to be examined. Two studies on knowledge and awareness among doctors regarding tuberculosis and leprosy were conducted in Bombay. It was found that for treating tuberculosis patients, 100 private doctors prescribed 80 different regimens, most of which were inappropriate and expensive [Uplekar and Shepard 1991]. With regard to leprosy, it was found that there was a gross lack of knowledge and awareness among private doctors about the disease and about the National Leprosy Control Programme [Uplekar and Cash 1991]. The medicines and injections which the doctors use are either samples given by the medical representatives or those bought from the open market. Usually the doctor gives those medicines and injections received as samples or sells at a higher rate those bought. This is unethical since the doctor infringes on the pharmacists trade. Some of the doctors also give medicines in loose paper packets or bottles. This practice is incorrect since the patient does not know what the packets/bottles actually contain. There is rampant use of irrational medicines and injections by the doctors in the private health sector. In Jalgaon district, Maharashtra, for illness episodes of diarrhoea, 72.5 per cent received injections, for cough and cold, 66.7 per cent received injections; for malaria, 87.5 per cent received injections; for measles, 61.1 per cent received injections and for heart diseases 76.5 per cent received injections [Duggal and Amin 1989]. Irrational practices are common among doctors in the public as well as private health sectors. But it is on the higher side in the private sector. In Madhya Pradesh it was further found that out of 884 illness episodes which received medicines along with injections, 86.09 per cent of them received it from the private health facility [George, Shah and Nandraj 1993].

Further, preliminary results of a study being conducted in a typical district of Maharashtra showed that unnecessary use of injections, irrational drug combinations, hazardous drugs and unnecessary drugs were prescribed more in the private sector. Out of a total of 633 prescriptions analysed from 27 private clinics it was found that 28.9 per cent were of irrational drug combinations, 9.6 per cent were for hazardous drugs, 45.7 per cent were unnecessary drugs and 26.5 per cent were unnecessary injections. Compared to 591 prescriptions from 17 public clinics, it was found that 2 per cent were irrational drug combinations, 0.5 per cent were for hazardous drugs, 28.4 per cent were for unnecessary drugs and 24.2 per cent were for unnecessary injections [FRCH (b) 1993]. The main source of continuing education for doctors are the medical representatives. Medical representatives of the pharmaceutical industry, including those from the renowned multinationals, in their race for fulfilling targets, approach those not having proper or dubious qualifications. In this manner, they also encourage quackery.

The time spent with patients for diagnosing and explaining would depend on the load of patients, the doctor has per day/hour and or demand for the services. A public opinion study conducted by Medico Friend Circle (MFC) showed that out of 208 respondents 61 per cent felt that the waiting period to see a doctor was highly unreasonable: that is, beyond 20 minutes [MFC, Bombay Group, 1993]. Besides, many of the doctors while dispensing medicines and injections or recommending investigations, do not provide information to the patient regarding the diagnosis and side effects. In fact, many of them get angry when questioned about the side effects of the drugs prescribed, the investigative procedures recommended or regarding the diagnosis. The MFC study found that 41 per cent of the doctors did not give information about the diagnosis and among those who gave information only half gave complete information. Only 16 per cent of the respondents were given information on the side effects of drugs. About 48 per cent of the respondents were completely satisfied with the behaviour of the doctors, 27 per cent partially and 17 per cent not at all.

Doctors' charges are more often than not exorbitant and irrational. The charges levied are arbitrary, irrational and without any proper basis. The question of fees and charges raises ethical issues, the important one being the basis on which the price of skills in a profession which is meant to be caring are computed. There are no restrictions or guidelines for the fees charged by the practitioners or consultants in the country. There is no standardisation of fees in the country. In the MFC study, in answer to the question regarding standardisation of fees charged by the doctor, it was found that 65 per cent of them felt that there should be some form of standardisation of fees. The study also found that nearly 76 per cent of

the doctors did not give a receipt for the payments made, only 24 per cent of them gave receipts after being asked for it.

The earnings of doctors have been studied only recently. A study undertaken in Bombay city found that a GP's net income, on an average, works out to Rs 16,560 per month [George 1991]. Another study conducted in Delhi found that on an average the net income of a GP practising in a clinic or residence was Rs 24,290 p m, and a graduate gynaecologists income was found to be Rs 28,910 p m. With regard to those having postgraduate qualifications in medicine, the average income was found to be Rs 27,880 p m, for general surgery Rs 37,870 p m; and for gynaecology Rs 53,870 p m [Kansal 1992].

The fees of the doctors has grown apace with private health care. The NCAER study showed that 55 per cent of the household expenditure on health care was spent on private doctors and only 39 per cent on public institution. Many patients and their family members have been pauperised during the course of treatment from the private health facilities.

Figures regarding cases treated, diagnosis, type of treatment provided, amount charged, etc, are not easily obtainable from private hospitals and nursing homes. Only recently due to the demands made by the judiciary, various facts have come out. In Calcutta a petition was filed by an advocate in the Calcutta High Court regarding the conditions of private hospitals and nursing homes. In response to this a committee was appointed by the speaker of the West Bengal legislative assembly in 1985 to prepare a report. This report found that the nursing homes lacked adequate floor. This report found that the nursing homes lacked adequate floor space, ventilation, lighting, water, bathroom facilities and qualified doctors and nursing staff (*The Telegraph*, July 2, 1989).

In 1991 the chief justice of the Bombay High Court directed the Bombay Municipal Corporation (BMC), to set up a permanent committee to oversee and supervise the implementation of the Bombay Nursing Home Registration Act (BNHRA), 1949, and make recommendations. This judgment came about due to a public interest litigation filed by a victim's daughter and the activists of MFC (Bombay Group). In this case a homeopath doctor administered a wrong blood type during transfusion to the patient in an allopathic hospital. The case raised questions regarding standards of medical practice in private hospitals and nursing homes, quality of staff employed and treatment offered, equipment used, the general administration of these hospitals and their accountability to the people at large. The case also further highlighted the role of the implementation agencies.

The committee decided to look at the functioning of existing hospitals and nursing homes in the city of Bombay. As part of this exercise, 24 hospitals and nursing homes in the eastern zone of Bombay were studied [Nandraj 1992]. The findings from the study are used here to throw light on the various broader issues with regard to private hospitals and nursing homes.

In India the contrasts in the private health sector with regard to hospitals is vast. While there are the huge corporate hospitals the majority are those having 10 to 30 beds, with the average number of beds in Bombay being around 10. As it is quite well known very few hospitals function from an independent building. The study in Bombay found that 62.5 per cent of the hospitals were located in residential premises, and 12.5 per cent were run from sheds which had roofs of asbestos, tin, etc, and only 8.33 per cent had functioned in independent buildings. The study further found that 50 per cent of the hospitals were located in poorly maintained buildings or were in a dilapidated condition. Hospitals functioning from residential premises pose various difficulties. Residents staying in the premises are put to a lot of hardship. Secondly, a residential premise is not suitable for a hospital or nursing home with its narrow passages and small doors. The urban development department of the BMC specifies that the hospital if run from a residential building, should be located on the ground floor or the first floor only and that they should have a separate entrance. In rural areas, a practising GP generally keeps one or two beds in the clinic for the exclusive use of his/her patients since the facilities for indoor care are quite distant. These could also be considered as hospitals since they provide indoor care.

The study in Bombay found that out of 22 hospitals and nursing homes supposed to have operation theatres (OT), only 15 had an OT, and in seven, the labour room was combined with the OT. The average area of the OT was less than 100 sq ft. It was generally observed that some of the OTs and labour rooms were in the kitchen; leakages were to be found in the OT and labour room with paint from the ceiling and walls peeling off; and 17 hospitals and nursing homes did not have a scrubbing room. As for emergency services there were no supportive services like ambulance services, blood, oxygen cylinders, generators, etc. Many of the hospitals and nursing homes were ill-equipped, especially those providing maternal health services, for instance many of them did not have resuscitation sets in the labour room for new-born babies. Many nursing homes claim to provide ICCU services but most do not have or able to afford the necessary equipment. They do not have doctors round the clock. And even those that do rarely have an allopathic doctor trained in cardiology.

Private hospitals and nursing homes fall very short of the requirement of trained personnel. Majority of them employ unqualified staff. In Bombay out of 24 hospitals and nursing homes only one hospital had employed a postgraduate doctor, whereas 10 had doctors trained in other systems. Few hospitals had provision for the doctors to be present round the clock. Majority of the nursing homes utilised the services of visiting consultants. Many private hospitals are staffed or run by doctors employed in public hospitals. It is quite common for such doctors to lure patients to their private hospitals, while misusing public facilities.

Only seven institutions employed qualified nurses and that too one nurse each. Most of them employ unqualified nurses who were either trained by the doctor or had received training for three to six months from various private training institutes which have also sprung up to meet the needs of private hospitals. These nurses are paid measly salaries and their working conditions are pathetic. During informal discussions with the nurses we found that they were paid around Rs 500 to Rs 700 per month in Bombay. In another study in Delhi it was found that the condition of those employed in private health establishments, were working in extremely grim conditions. For almost all of the categories of personnel, the maximum salaries drawn by private medical employees was lower than that of the government employees in the same category. This apparently is an exploitation of lower staff by high income private practitioners [Kansal 1992].

The sanitary conditions of private hospitals and nursing homes leaves a lot to be desired. The Bombay study found that many of the hospitals were congested, lacked adequate space: passages and entrances were narrow and crowded. There was not enough space for easy movement of a trolley or a stretcher. The study in Bombay found that in 37.50 per cent of cases, the hospital premises were dirty as were the beds, especially in the general ward. More than 60 per cent of institutions did not have a minimum required 50 sq ft space for each bed. Lighting facilities were found to be inadequate in 10 of the hospitals and nursing homes.

The area surrounding the hospital plays an important role in the treatment of a patient. During the study it was observed that one of the hospitals was situated near a factory and the entire atmosphere was visibly polluted. Noise emanating from the factory was well over prescribed limits. Many of the nursing homes were found to be situated close to busy traffic areas. Our findings with regard to waste disposal, were shocking. All the hospitals studied, disposed of their waste in the common garbage dump. This form of disposal has serious implications, because of

the increased risk of spreading infectious diseases, including AIDS. Secondly, waste disposed thus may be recycled for further use as reports from Delhi have shown.

The number of toilets and bathrooms were not in adequate proportion to the number of beds provided in the hospital and also, the area provided for such facilities are very small. During visits to one of the hospitals, blood-stained linen was being washed in the common bathroom and being dried in the passages. It was quite shocking to note that many of the hospitals did not have continuous supply of water, and in some it was being provided through tankers and other means.

In the recent past care provided in private hospitals has come in for closer examination. Private hospitals tend to perform unnecessary investigations, tests, consultations and surgeries. Doctors in private hospitals more often do not reveal the diagnosis and keep recommending tests to 'diagnose' the ailment whereas in the public hospitals, doctors are required to at least write the diagnosis on the case paper. Due to the fact that surgeries are 'profitable' many private hospitals are found to be conducting unnecessary surgeries. The KSS survey revealed that 31 per cent of deliveries were by caesarean section. More significantly 70 per cent of the hospitals where caesareans were routine were privately owned [Kannan et al 1991]. In Maharashtra the Mangudkar committee found that the average rate of caesarean childbirth in government hospitals was 5 per cent while in the private sector it was nearly 30 per cent. According to a member of the committee private clinics charge between Rs 2,000 and Rs 5,000 for caesarean delivery while normal delivery fetches them Rs 300 to Rs 700. Ultrasound investigation, amniocentesis, epidural anaesthesia, etc, are done unnecessarily, particularly in private nursing homes. One of the doctors in Bombay commented "Very often endoscopy is done just because the hospital has the facility" (*The Week*, January 5, 1992). In bigger hospitals there is pressure on the doctors to ensure that all the beds are occupied at all times and equipment available in the hospital are used fully. Many hospitals fix the amount of 'business' a physician/surgeon has to bring.

The majority of private hospitals and nursing homes across the country generally refer patients who develop complications to public hospitals so that they are not liable for cases of death. Most of these hospitals refuse admission to accident cases and those involving medico legal work, even when patients are in a very serious condition. Many institutions refuse admission to patients unless a certain amount of money is paid beforehand. Public hospitals in most cases do not refuse admission to serious patients, if they have the facilities. In public hospials one can still demand services while in private hospitals they can turn patients away at their will.

Most private hospitals are run by 'medical entrepreneurs'. Many do not maintain proper books of accounts. The charges are different for diverse kinds of nursing homes. The charges include consultation fees and charges for bed, nursing, operation, operation theatre, various investigations and disposables used, for medicines, etc. These charges are levied by different entities—for instance the doctor conducting the operation is often different from the one who owns the nursing home, the anaesthetists charges are again separate. We found that the accounts in only one paediatric baby care nursing were maintained properly. There it was found that the total gross income for one month was Rs 2,20,000 [Nandraj 1992]. A study undertaken in Delhi of the earnings of the private practitioners and that of the ones running nursing homes with graduate (MBBS) qualifications found their net income per month was Rs 73,650 and for those with postgraduate degrees the earnings were up to Rs 79,960 p m [Kansal 1992]. In Delhi an amendment under discussion is seeking to get the charges levied by the hospital, displayed in a prominent place.

Private hospitals are known to have an unhealthy nexus with the pharmaceutical industry. Six patients who had every chance of survival died in a prestigious private hospital in Bombay due to the administration of a substandard drug during operation. Reports alleged that three doctors attached to the hospital were connected with the ownership of the company which had supplied the drug. Private hospitals are less accountable to the people than government hospitals. If they have not had as much bad publicity as public hospitals, it is primarily because of patients' reluctance to name names, or reveal information and because of the inaccessibility of reliable information.

Regulatory Bodies

The rules and regulation framed for practitioners broadly fall under the respective state council acts and the Indian Medical Council Act for various systems of medicine. The practitioners are also governed by the Drugs and Pharmaceutical Act of 1950. Recently private practitioners and hospitals have been brought under the purview of the Consumer Protection Act. Medical councils are statutory bodies that set the standard of medical practice, 'discipline' the profession, monitor their activities and check any malpractice. The certificate of registration issued by the council has to be displayed in a conspicuous place in the place of practice. The council has to maintain a register of the doctors and this has to be updated regularly. Renewal of registration has to be made periodically. Those not registered with the medical council cannot practise. Although the bulk of the practitioners in the country are trained in other systems of medicine like homeopathy, ayurveda, unani, siddha, etc, most of them practise allopathy.

The medical councils regulating the conduct of doctors have failed in their duties miserably. They have even failed in their basic duty of maintaining and updating the register of doctors. This is reflected in the data brought out by *Health Information of India* where many state medical councils have not sent in the required information to the central government for years together. In the Maharashtra Medical Council (MMC) the register of doctors is outdated and full of errors. Secondly, there have been very few instances of doctors being penalised for negligence or violating the code of ethics. The enquiries are held in secrecy. The Maharashtra Medical Council (MMC) was unable to produce even a single record of action taken against erring doctors. The medical councils in the country are in a mess. They have given permission to private medical colleges which are substandard, understaffed, those not meeting the minimum prescribed standards, like having their own hospitals, etc, and have failed to resist the pressure from politicians for opening of new medical colleges.

The recent elections to the MMC clearly brought out the way things are managed in the council. Elections are held through the postal ballot method. The registers of the council were not updated: so in a few instances ballot papers were sent to doctors who had long expired. The names of doctors who had registered with the council were not found in the register: doctors who were indicted in law courts and with dubious degrees were candidates in the fray. There was massive rigging in the election process. A panel of doctors who were in the fray paid money to the postal department and intercepted ballot papers which were not meant for doctors who were absent or dead, etc, and stamped them. Blank ballot papers were collected in an organised manner from doctors across the state and stamped. In an open forum some of the doctors in fact endorsed this practice, saying that there was nothing wrong with this procedure. Clearly, there is something seriously wrong. Politicians doing the same thing would have been accused of fraud. Do doctors expect patients to believe that a council elected in this manner is capable of disciplining unscrupulous practitioners? [Pandya S 1993].

A study undertaken on behalf of the MFC (Bombay group) on rules, acts, regulatory and monitoring mechanisms for hospitals in various states of India came out with disturbing findings. A mailed questionnaire was sent to all the health departments of the state governments and union territories in India. Tamil Nadu, Punjab, Andhra Pradesh, Kerala, Goa, Daman and Diu, Mizoram, Gujarat, Orissa, Sikkim and Manipur responded to the questionnaire. None of these

states have any rules, laws, regulations of even data for private hospitals and nursing homes. Government of Kerala specifically wrote back "This state government has no control over private hospitals/nursing homes functioning in this state at present, as there is no legislation now for this purpose". Added to these are Madhya Pradesh and Rajasthan. This was found out through visits and discussions with government officials of the respective state governments. To our knowledge only in Maharashtra and Delhi is there a legislation for private hospitals/nursing homes. In Delhi there is the Delhi Nursing Home Registration Act (DNHRA), 1993. One of the largest private health sector in the world, providing 70 per cent of care in India, functions practically unregulated!

The broad features of the BNHRA and DNHRA Acts are somewhat similar. The objectives of these acts are to provide for registration and inspection of nursing homes. The acts stipulate that every year the nursing home and hospitals are required to make an application for registration or renewal for registration to the local supervising authority, which could be the municipal corporation, municipal body, district board, district panchayat, etc. During the time of application detailed information should be provided in terms of qualification of staff, adequacy of staff, sufficient and proper equipment, adequate accommodation facilities and space, and regarding sanitary conditions. Maternity homes have to specify whether they have on their staff a qualified midwife. The Maharashtra Act provides for the local authority to formulate bye-laws. On receipt of application for registration the local authority may refuse to register the application if any person employed in the nursing home is found unfit, whether by reason of age or otherwise or if the nursing home or hospital is not under the management of a qualified medical practitioner or a qualified nurse, or does not have adequate space, equipment, etc. Failure to register under the BNHRA could mean a fine of Rs 500 for the first offence and imprisonment for three months.

There are other regulations that are also applicable to hospitals and nursing homes such as those referring to or related to buildings, drainage and sanitary facilities; laws regarding Employees Provident Fund, minimum wages, maternity, working conditions among others. In addition to these hospitals registered as trusts or public societies have to follow the legislation formed for the trusts and public societies. These laws make it essential to file returns periodically to the appropriate authority.

During the proceedings of the public interest litigation referred earlier, it was found that the municipal corporation, the authority for registration in the city of Bombay, was not enforcing the act. The municipal corporation started registering the hospitals and nursing homes after the case was filed. The judges in their order observed that "The writ petition has served the purpose of activising the concerned authorities, who seem to have woken up and taken certain steps in the direction of implementation of the various provisions of the law." The municipal corporation during the hearings admitted that in several wards of the city, the officials had not visited the hospitals for the past two to three years. Many of the nursing homes were not registered with the local ward office as per requirement. In fact, one out of four hospitals were functioning without proper registration. It admitted that for the last three years it had not taken action against any hospital or nursing home nor collected fines. It has not prosecuted a single nursing home up to now. The municipal corporation was unable to submit a complete list of private hospitals and nursing homes functioning in Bombay to the court. In Delhi, the administration admitted that only 134 out of 545 nursing homes were registered. The BNHRA Act is applicable to all of Maharashtra, however its implementation was found to be restricted to the cities of Bombay, Pune, Nagpur and Sholapur. During the hearing of the case, the state government issued a directive to all the municipal corporations, councils and municipalities in Maharashtra urging them to implement the provision of the said act. However, during field work we found that the directive was not implemented as the local bodies did not have enough information regarding the act (one of them did not even have a copy of the act), and also, the bye-laws were not yet

formulated by these bodies. Both the acts are very deficient. The use of the words like 'adequate' makes the provisions ambiguous. They do not spell out what 'adequate' means with regard to the provision of the acts. There are no minimum requirement and guidelines regarding space, sanitary conditions, personnel, equipment, fees to be charged, etc, to be followed by the hospital and nursing home authorities.

The judges in the Bombay High Court recognising the inadequacy of the existing act and also its poor implementation directed the Bombay Municipal Corporation (BMC) to appoint an apex committee and three zonal committees to look into the implementation of the act and make recommendations. The committees were overwhelmingly filled with bureaucrats of BMC, who in the first place were supposed to implement the act. Right from the inception bureaucrats in the committees started placing obstacles in the committees functioning. And very little progress has been made on the matter.

Corrective action needs to be taken to bring about reforms in this sector. As a first step people should be made aware of their rights and duties *vis-a-vis* the health care system, specifically the private health sector. There should be adequate representation of the people and consumer organisations on the various regulating and monitoring bodies functioning at various levels. Legislation should be enacted where there is none and the various existing laws should be implemented. The state should ban and take strong action against the private practice of doctors employed in government institutions. One of the main reason behind the non-functioning of the public health system is due to the private practice of the government doctors and other functionaries. With regard to private practitioners, the state and medical councils should ensure that only properly qualified persons practice. Through licensing and other means the proper geographical distribution of practitioners and hospitals should be ensured in the country to prevent over-concentration in certain areas. There should be regular medical and prescription audits and the renewal of licence and registration should be dependent on it. Records should be maintained properly and patients should have access as a matter of right. Minimum standards and requirement for various types and kinds of hospitals and nursing homes should be laid down. With regard to charges and fees there should be standardisation of fees charged by the practitioners and fixation of reasonable charges by hospitals and nursing homes for services provided. These should be displayed prominently in a conspicuous place. There is a need to overhaul the medical councils in the country. They should make provision for registers to be maintained properly and keep them open for public scrutiny. There should be provision for continuing medical education on a periodic basis with renewal of registration dependent on it.

Notes

[The support of friends and colleagues at MFC, CEHAT and FRCH underlies this article, in particular the author has greatly benefited from Ravi Duggal and Amar Jesani of CEHAT who have encouraged the author in carrying out the above-mentioned studies. Thanks are also due to Alex George for his helpful comments.]

1 In 1986-87, 42nd round of National Sample Survey organisation (NSSO) found that for hospitalised cases 36.85 per cent episodes in rural and 36.59 per cent episodes in urban areas used private hospitals and nursing homes. With regard to OPD, 53.01 per cent cases in rural and 51.83 per cent cases in urban areas utilised the private doctor. Private hospitals and nursing homes accounted for 15.88 per cent cases in rural areas and 17.33 per cent in urban areas. The per capita expenditure on health per year by the household was Rs 56.18 [NSSO 1989]. NSSO data are gross underestimates when compared to micro-level studies conducted by other organisations. During the same period the Foundation for Research in Community Health (FRCH) conducted a study in Jalgaon district of Maharashtra. This study brought out that in 83.45 per cent of acute illness episodes private practitioners and hospitals and only in 9.07 per cent public health facilities were utilised. The per capita expenditure on health was found to be Rs 182.49 per year. Households reported that 7.64 per cent of total consumption expenditure and 9.78 per cent of income were spent on health care [Duggal and Amin 1989]. Kerala Shastra Sahitya Parishad (KSSP) which undertook a study in rural Kerala in 1987 found that in 66 per cent of illness episodes approached private health facilities. The per capita cost per year incurred by the household on health was Rs 178.33. The percentage of the reported income spent on health was found to be around 7 per cent. [Kannan, Thankappan, Raman Kutty and Aravindan, 1991]. The National Council of Applied Economic Research (NCAER) conducted an all-India study in 1990 which brought out that the private doctor was utilised in 54.75 per cent of illness episodes in urban areas and 55.46 per cent of episodes in rural areas. The average household expenditure for treatment worked out to Rs 142.60 per illness episode in urban areas and Rs 151.81 per episode in rural areas [NCAER 1992]. During 1991, the per capita expenditure incurred by the state was Rs 58 [Duggal Nandraj and Shetty 1992]. Another study conducted in two backward districts of Madhya Pradesh, Morena and Sagar by the above organisation in 1991 showed that out of 1,932 illness episodes reported, 69.05 per cent were treated by private health facilities. The per capita expenditure incurred by the household on health worked out to Rs 299.16 per year [George Shah and Nandraj 1993]. The per capita expenditure incurred by the state during 1991 on health was Rs 45.

DISCUSSION

Sociology, Gender, Family Studies

Regressive Incorporations

Patricia Uberoi

THE past year has seen the publication in *EPW* of a number of articles discussing—and for the most part deploring—the current state of research and teaching in sociology [see Das 1993; Giri 1993; Deshpande 1994]. The latest of these, by Sharmila Rege (*EPW*, May 7, 1994), speaking especially of the situation in western India, endorses the view that sociology in India has become a rather lacklustre discipline, its leading concepts presented through outdated mass-market American texts, and notably devoid of engagement with the social world outside the classroom. Rege's solution to this malaise of pedagogic routinisation is a novel one: opening sociology to the critical challenge of women's studies. Women's studies, she writes, "initiates a critical dialogue...arising out of the realisation that one is at once immersed in and alienated from one's discipline" (1994: 1155). It poses a challenge both to the content and to the methods of conventional sociology.

Those of us who have been involved in teaching women's studies courses can testify that this is indeed an area that invites an unusual degree of student engagement [Uberoi 1989-90], and not only from the women students. In fact, the problem is not that the subject matter is abstract and remote from the lived experience of teachers and taught, as Rege alleges sociological concepts in their present pedagogic packaging usually are, but on the contrary that disciplining, 'sociologising' and critically interrogating this experiential knowledge is a pedagogic challenge in itself.

All the same, it is interesting that Rege should have proffered this particular solution to the problem of the crisis in sociology, for she simultaneously concedes that the potential intellectual challenge of women's studies is still only a potential. In practice, challenge has been contained by the mode of accommodation of women's studies programmes within the academy: for the most part in separate (and thereby marginalised) women's studies centres, or in the 'optional' courses of academic curricula, leaving core disciplinary areas untouched. She also concedes that much of the current production in women's studies is of such indifferent quality that it could hardly be expected to restore life and vigour to the ailing body of Indian sociology.

Rege's complaint regarding the indifferent standard of much of the research and publication in the field of women's studies was obviously made in a spirit of constructive self-criticism. Others, however, have been quick to seize on the early signs of disease to diagnose a terminal condition. Citing the authority of global trends, they assert that the feminist movement—the intellectual and political impetus behind women's studies—has now virtually played itself out, and been overwhelmed by a backlash of its own creation. Nearer home, too, an impression has been created that women's studies is both academically and institutionally in a state of irreversible decline, almost before it has got off the ground. Substantiating this gloomy prognostication are reports that a good number of the 22 UGC-sponsored women's studies centres are slated for closure, following an adverse review committee report on their functioning.

In a recent seminar in New Delhi held to deliberate on an Action Plan for the current International Year of the Family,[1] it was suggested in the panel on 'Family Research, Education and Training' that it might be a good idea if the existing women's studies centres could be converted into family studies centres. Such a move, it was argued, would simultaneously serve to revive the flagging fortunes of women's studies, and provide an established institutional framework for the development of family studies.[2]

Practically speaking, there is little danger of such recommendations being accepted and speedily implemented. As the secretary to the ministry of welfare himself assured the seminar participants, reports and action plans are meant to "sit on the shelf", unless or until the government decides to take the initiative further. Nonetheless, it needs to be remarked that the proposal to revive women's studies by accommodating it within programmes of family studies is not entirely innocuous. Though casually made along with a host of other suggestions, and presumably well-intentioned, it demands critical interrogation as revealing a mind-set that seriously misrepresents the aims and aspirations of the project of women's studies.

To begin with it assumes that women's studies programmes were merely the product of international and national bureaucratic initiatives, co-ordinating with the beginning of the decade for women but since then overtaken by many other programmes—the year of the handicapped, of indigenous peoples, etc.—and now the year of the family. This assumption completely discounts the catalytic role of the women's movement in bringing women's issues to the forefront of consciousness, and sustaining them there.

Secondly, to seek to incorporate women's studies within family studies is immediately to circumscribe its wider and more critical agenda. Most certainly, women's studies has a special interest in the institution of the family, but it aspires, beyond this, to establish a critical feminist perspective on the totality of social life—on the political system, the economy, the environment, science and technology, literature and the arts, etc, and not merely on the domestic sphere. In fact, an important (if not uncontested) strand in feminist thinking has been the attribution of women's subordination to the symbolic divide between the public and the private domains, the legitimate world of male activity, and the proper place of women. In this light, to seek to return the women's question to the domestic sphere is a politically retrograde, if not intentionally mischievous, gesture.

Thirdly, at both the transnational and the national levels, there is something inherently conservative in the project for the year of the family. Or rather, there is real tension evident between the idea(l) of the family as the foundational core of society and its values, the source of social stability and, in the rhetoric of the seminar, an 'agency' for human, social and economic development; and the quite contrary view, which owes much to (radical and Marxist) feminist thinking, that the family is a basic source of domination and oppression: of old over young; of men over women and children; even of the young over the aged. The former view emphasises that the family is (or could or should be) the source of important social values—of love and caring, of sacrifice, of respect for elders, and of discipline—that 'healthy' families are the basis of a 'healthy' society. The latter insists that mystifying the family in this way quarantines it against interrogation, criticism and intervention, and works to restrict individual rights and freedom.[3] It has been increasingly recognised that the family is also the site of many forms of violence and abuse which, for one reason and another, rarely come into the public light of the law. And while feminists are not agreed among themselves on the desirability of state intervention in the private domain—as when they insist on women's right to reproductive choice and abortion, yet seek to legislate against amniocentesis[4]—the picture that emerges is of the family as a ground of contestation and struggle over values and resources, as well as a source of love and sharing, care and nurture, beyond the operation of market relations. Such incompatible views are not easily reconciled.

is well known, too, that conservative regimes are typically self-proclaimed upholders of family values; so too, usually, are fundamentalist religious groups. What is not so well-recognised is the fact that the rhetoric of upholding the family may also have an important role in the project of economic liberalisation, rationalising the state's abdication of social welfare responsibilities for the delivery of medical care, education, health and nutrition, the care of vulnerable categories like the aged, the handicapped, the chronically ill, etc.[5] These welfare functions and services can be left to families—especially the women of families—to provide, on the grounds that they provide them so well! In other words, the celebration of the caring functions of the family also masks the retreat of state responsibility.

Participants in the seminar were not altogether unaware of the contradictions inherent in the rhetoric of discourse on the family, as allusions to those paragons of Indian wifely virtue, Sita and Savitri, and to the excellence of the Indian (joint) family system in comparison with the western family[6] jostled with pleas to initiate the systematic study of child abuse, domestic violence, incest, the neglect of the aged, etc. Several of the participants, responding no doubt to the IYF slogan, "Building the smallest democracy at the heart of society", alluded to the need to 'democratise' family functioning, though without spelling out very clearly the forms and mechanisms that such democratisation might take.[7] Others asserted the optimistic belief that the family has the potential to be an agency of social and economic development, while conceding that it was often, in reality, a site of inequality, exploitation and violence. But such gestures still fell far short of a really tough-minded grappling with the conceptual and practical issues at stake.[8]

Personally, I do not believe that women's studies (or its intellectual back-up, feminist theory) is in a terminal condition, though institutionally it may not be faring too well. I would also go along with Rege's argument that women's studies still has much to contribute to mainstream sociology—and to other disciplines as well. And I certainly have no wish to denigrate the challenge of family studies, which is all the more challenging for the intractable conceptual problems at its core. The dismissive attitude of many present-day sociologists to the study of the family (leave it to the anthropologists who study primitive kin-based societies, or to the social workers who specialise in studying 'families with problems' [Bharat and Desai 1993] can only leave sociology conceptually and substantively impoverished.

But I would also insist that family studies can no more encompass women's studies than women's studies can encompass family studies. To deny their basic incompatibility of orientation in the service of an institutional marriage of convenience is surely to embark on a union which can be neither fertile nor creative.

Notes

1 National Seminar on 'The International Year of the Family, 1994 Enhancing the Role of the Family as an Agency for Social and Economic Development', sponsored by the Ministry of Welfare, UNICEF, and the Tata Institute of Social Sciences, May 15-16, 1994.

2 The proposal was not in fact recorded in the draft Action Plan of the group, though the document did record the parallel bureaucratic proposal to convert the present department of women and child development into a department of family affairs. See Action Plan, Group V, pp 5, 7.

3 One is reminded here of the perennial question that is put to students of sociology regarding the difference between, and the possibility of reconciling, the so-called consensus and conflict models of society.

4 See Menon 1993.

5 The danger was, however, conceded in the IYF approach paper, p 9.

6 As the minister of state for welfare, K V Thangku Balu declared in his inaugural speech at the seminar: "India is proud of its ancient heritage of a united and stable family system. The Indian families have demonstrated a unique strength of keeping themselves together despite the growing stress and strain and external influence on Indian culture" (para 2).

7 See approach paper, pp 2, 7.

8 An instructive exception here was the presentation by psychologist S Anandalakshmy who sought to address the tricky conceptual implications of the IYF slogan: "The term democracy", she said, "will have to be redefined for its use in this context" (1994: 1).

BARCLAYS BANK PLC

INDIAN BRANCH

(Incorporated in the United Kingdom with Limited Liability)

Schedule 17—Notes Forming Part of the Accounts for the year ended 31st March, 1994

1. Principal Accounting Policies
   (a) General
   The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.
   (b) Transactions involving foreign exchange
   (i) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year. Non-monetary assets have been carried in the books at the contracted rates.
   (ii) Income and expenditure items have been translated at the exchange rates ruling on the date of the transaction.
   (iii) Outstanding forward contracts have been revalued at the exchange rates prevailing at the close of the year.
   (c) Investments
   (i) Investments categorised as permanent are valued at cost.
   (ii) Investments categorised as current are valued as follows:
   a) Where quotations are available, on cost or market value, whichever is lower.
   b) Where quotations are not available, values have been determined using the yield to maturity basis.
   (d) Fixed Assets
   (i) Premises and other fixed assets have been accounted for at their historical costs.
   (ii) Depreciation has been provided on the straightline method at the rates specified by Barclays Bank PLC. In respect of subsequent additions depreciation is provided with effect from the quarter in which the additions are made.
   (e) Staff benefits
   Contribution to the Gratuity Fund has been made as per actuarial valuation.
   (f) Net profit
   The net profit disclosed in the profit and loss account is after:
   (i) Provisions for taxes on income in accordance with statutory requirements.
   (ii) Other usual or necessary provisions.
2. A demand raised in relation to prior year's tax amounting to Rs. 18,843,986 which is, as advised, considered unsustainable in appeal, has accordingly not been provided for in the accounts.
3. At 31st March, 1994 the bank's risk weighted capital ratio was 9.5%.
4. The previous year's figures have been regrouped wherever necessary.

Auditors' Report on the Indian Branch of Barclays Bank PLC.

We have audited the attached Balance Sheet of the Indian Branch of Barclays Bank Plc. as at 31st March, 1994 and also the annexed Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore, drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that in accordance with sub-section (3) of Section 30 of the Banking Regulations Act, 1949.

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory.

b) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branch of the Bank.

c) In our opinion, proper books of account, as required by law have been kept by the Indian Branch so far as appears from our examination of those books.

d) The Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account.

e) In our opinion, and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31st March, 1994 and of its profit for the year ended on that date.

Firm Allotments

LIC Mutual Fund	Rs. 20.00 Lacs
GIC Mutual Fund	Rs. 20.00 Lacs
Indbank Mutual Fund	Rs. 10.00 Lacs
NRIs/OBC's	Rs. 72.00 Lacs

Export tie-up with ICD Group BV, Netherlands

Term Loan Assistance by IDBI

Public Issue of 30,00,000 Equity Shares of Rs. 10/- each for cash at par aggregating Rs. 300.00 Lakhs.

ISSUE HIGHLIGHTS

- The Project cost was estimated at Rs 825.00 Lakhs in October 1992 by IDBI for the term loan assistance and sanctioned term loan of Rs. 260.00 Lakhs.
- Foreign Exchange Earner - Marketing arranagement with ICD Group BV, Netherlands, for 5 years
- Export earnings fully exempt from Income-tax
- Promoted by qualified and experienced professionals.
- Equity participation of Rs 35.00 lacs by APIDC, Hyderabad, a Development Financial Institution
- For over 40% of the Issue, Firm Allotments made to LIC, GIC & Indbank Mutual Funds and NRIs/OBCs.
- Company operating in high growth Industry with versatile Plant & Machinery - can manufacture other bulk pharmaceuticals also.
- Low gestation period-commercial production to commence from July, 94.
- Easy liquidity - Listing at Hyderabad, Madras and Bombay Stock Exchanges.

The investors may note that, in case of over subscription, the allotment shall be on proportionate basis and a SEBI nominated public representative shall be associated in the process of finalisation of basis of allotment.

RISKS AS PERCEIVED BY THE MANAGEMENT

INTERNAL TO THE COMPANY

1. Import content constitutes 61.72% of raw material cost. The landed cost of these imports is subject to exchange rate fluctuations.
2. The working capital requirements of the Company for the first year are estimated at Rs 358.00 lacs, out of which Rs 94.00 lacs was provided in the project cost. The Company has obtained in principle approval from State Bank of India, Industrial Finance Branch, Hyderabad for the balance Rs.264.00 lacs.
3. Approval of Chief Inspector of Boilers, Andhra Pradesh for installation of coal fired Boilers for steam has not been obtained.
4. Though the Company was incorporated in 1990, the project is yet to be fully implemented and commercial production is now scheduled to commerce in July, 1994.
5. The permission for manufacture of Terfenadine is yet to be obtained.
6. The project implementation may be affected by time and cost overrun.

EXTERNAL TO THE COMPANY

1. The Company may face competition from existing and new units as is normal and prevalent in any industry.
2. The selling prices of bulk pharmaceuticals have been fluctuating in the last couple of years.
3. Being export targetted and dependent on imports for raw materials, the Company's working could be influenced by Government's Export-Import policies.

PERCEPTIONS OF MANAGEMENT ON RISKS

INTERNAL TO THE COMPANY

1. The Foreign Exchange earned on exports will be a hedge against these possible fluctuations.
2. The Company is confident of getting final sanction for the required working capital limits.
3. The approval of Chief Inspector of Boilers, Andhra Pradesh will be given only after installation of the Boiler plant and the Company is confident of obtaining the same.
4. Though the Commercial Production was scheduled to commence in April, 1994, due to non-reciept of Government approval for land conversion, project implementation was delayed by three months.
5. The Company has made an application to the SIA, seeking the required permission and is confident of obtaining the same.
6. Based on the progress made so far, the Management is confident of implementing the project as scheduled and within the estimated cost. Further, adequate provision for contingenecies has also been made. In case of cost over - run, if any, the same will be met from promoters own resources.

EXTERNAL TO THE COMPANY

1. The Company has entered into a marketing arrangement with M/s ICD Group BV, Netherlands (ICD) whereby ICD shall purchase 48 Tpa (61.54% of instaled capacity) of the Company's production at prevailing international prices. The remaining production will be sold in domestic market, which has sufficient demand-supply gap.
2. As the Plant and Machinary being installed by the Company are versatile and capable of changing the product-mix and/or manufacturing new and more remunerative bulk pharmaceuticals, the Company is confident of achieving better sales realisation.
3. Given the pro-liberalisation policies advocated by Government of India and also with the Drugs & Pharmaceuticals Industry identified as 'Extreme Focus Area'., the Company doesn't envisage any adverse policies from Government.

Agriculture under GATT

What is the likely impact of the various commitments India has made under GATT, especially with reference to market access, domestic support and export competition in the area of agriculture? Do these commitments imply a threat to Indian agriculture? 1857

Understanding Indian Culture

Indian culture is an organic and historically determined unity which has escaped us over a period of time, almost parallelly and simultaneously with the slow but hopefully, not yet certain destruction of India. 1864

Tamil Nadu 'Model'

Tamil Nadu's achievement of registering a decline in fertility rates without the expected pre-conditions, such as, decline in infant mortality rates, improvement in literacy rates and the bettering of women's status needs to be better understood before being promoted as a 'model' of demographic success. 1850

Complex Question

While some Sikh religio-political organisations such as the Akali Dal and the SGPC view Sikhs as a nationality, Hindu chauvinists hold that they are only a part of the larger Hindu community. 1877

Towards New Initiatives

While the panchayat system and the process of rural reforms in West Bengal have indeed been successful under the Left Front, it is necessary now to think creatively about new initiatives. 1835

Not Decentralised

Haryana's new Panchayati Raj Act promises a lot more than it will be able to deliver, because it makes little effort to do away with the involvement of centralised authority at the local level. 1842

The Jawahar Rozgar Yojana, in Uttar Pradesh at least, has failed to generate adequate or relevant employment, or dissociate itself from the clutches of local bureaucracy. 1845

Assessing Corporate Sector

Existing data sources are far too insufficient and inadequate to give a reliable picture of the private corporate sector. Are there alternative sources of data? 1874

Three Years After

Narasimha Rao's three years in office have been characterised by authoritarian rule which has sidelined democratic institutions. 1839

No to Tobacco

Controlling the use of tobacco is possible only with a comprehensive and well-planned effort touching several areas of the economy. 1841

Changing Patterns

The confrontation between the Indonesian army and Muslim fundamentalists has pushed president Suharto into a corner. 1849

The Indian economy has wavered eclectically between alternative and opposed models of development and the rise of communalism as a political force has shaken earlier assumption. 1853

LETTERS TO EDITOR

On Bhutan

THERE is confusion regarding the total population of Bhutan ('Bhutan—Pushing out Nepalese', *EPW*, June 25). The Seventh Plan (Vol I) document (1991-92 to 1996-97) gives a figure of 6 million whereas the *Statistical Year Book of Bhutan* 1990 (published by the Planning Commission) mentions a figure of 14.56 million. A census is currently on. A significant drawback of the Nepalis' agitation was that it was premature and was looked upon as a fight against the native population (and the king) which are scattered throughout the country especially in the central Himalayan valleys. The Nepali population is primarily concentrated in the south, bordering India. The king, Jigme Singye Wangchuk, is highly respected in the country and is looked upon as a liberal minded personality. But he is supposed to be surrounded by hard liners.

Apart from physical force to 'cleanse' the society of Nepalis, there are several measures being implemented in Bhutan which are less known outside and which have serious negative implications for the Nepali-speaking population in the long run. The Dzongkha language, spoken by the Drukpas, is being made compulsory in the schools, gradually depriving the Nepali-speaking students of choosing their language, Lhotsam, as an optional. Dzongkha is compulsory at higher levels of education. Dzongkha is also being increasingly used in the administration, including judiciary, by replacing English. A more serious and obnoxious rule was introduced four years ago to gradually prevent the Nepali-speaking students from taking admission into the institutions of higher learning. After passing X and Inter, every student has to get an NOC (no objection certificate) from police to be eligible for admission. It is the Nepali-speaking students who end up not getting the NOC. During my two-year stay at Sherubtse College, Kanglung (affiliated to India's Delhi University and the only degree college in Bhutan) as a lecturer during 1991-93, I was a witness to a substantial decline in the in-take of Nepali-speaking students due to this stipulation. There were several students who were summoned, in the middle of the academic year or during exams, by the census authorities and told to leave the country. The discrimination is much worse in giving the jobs.

Though the Bhutanese national dress gives a distinct identity to its citizens and is very comfortable for mountainous living, it is extremely difficult to wear in the south (especially during summers) which experiences a subtropical hot and humid climate. While the wards of the rich people violate the dress norms right in the national capital Thimpu (a fact which was admitted in Bhutan's national English weekly, *Kuensel*), any tampering with the dress in the south, especially by the Nepali-speaking, would invite severe penal measures.

It is true that Bhutan forms an important part of the security zone for India. Because of Bhutan's strategic location, western countries are also showing keen interest in 'assisting' Bhutan's development. There are more than 30 international organisations (including UN) working inside Bhutan. The First and Second Five-Year Plans of Bhutan were completely financed by India. India's contribution has been very high for the subsequent plans also. For the ongoing Seventh Plan India has promised an amount of Rs 750 crore. A similar amount, if also spent, on north-east India would solve many problems. Huge amounts of money are spent on the military inside Bhutan. One should only see to appreciate with what enormous cost, in terms of men, money and material, India's Border Roads Organisation has constructed those roads in the lofty Himalayas. India also offers 100 scholarships annually to Bhutanese students for studies in various professional and degree courses in India. There are about 13 lecturers on deputation from Delhi University under the Colombo Plan at Sherubtse College. India's 'high profile presence' and its business community which trades with, and inside, Bhutan are also responsible, along with increasing western influence, for the growing anti-India feelings in the Bhutanese middle classes.

If one has to judge the respect Indians receive in Bhutan, then Sherubtse College is a good example. They are humiliated in everyday life. The only time when Indian teachers asserted some measure of self-respect in Sherubtse College was when a good number of them (including those on contract) boycotted a farewell function (for departing Indian colleagues) on June 14, 1993 because the principal, known for his anti-India attitude, messed it up with a VIP function. Recently, the king of Bhutan has conferred a high civilian honour, Dasho with a Red Scarf, on the principal. So much for the 'warm and friendly' relations between India and Bhutan!

ECONOMIC AND POLITICAL WEEKLY

Fifty Years After

THE 50th anniversary of the Bretton Woods Conference of July 1944 at which negotiations were completed for the establishment of the International Monetary Fund (IMF) and the World Bank (which began operations in early 1945) may be an occasion for governments of the developed and developing countries alike to celebrate and rejoice, but to discerning observers of the present world economic order, it is a sombre occasion. These institutions have long lost sight of the objectives which shaped their creation and have become instruments used to presssurise third world governments to impose inappropriate, undemocratic and unjust policies on their own people. The distortions that have appeared in the world economy, are in a way, a reflection of the twists and turns of the Bretton Woods institutions.

These institutions were the product of a historical period when the post-war Anglo-Saxon hegemony ruled the roost. The developing world was represented by 19 Latin American countries but only three African and four Asian countries including India, none of which enjoyed any freedom of action. The withdrawal of the Soviet and the Chinese governments made the institutions truncated and biased. The 30-year history of these institutions has been sordid: the advanced countries have systematically shot down any suggestion of reform emanating from the UN agencies, and have instead, used the cloistered boards of the IMF and the World Bank to impose, with crumbs of assistance for the LDCs, their own narrow perspectives of stabilisation and structural adjustment on the entire developing world, now including the so-called transition economies of the erstwhile communist regimes.

The current course these institutions are pursuing is likely to lead to even more distortions than before for two reasons. First, the industrial countries have opted for narrow monetarist and globalisation policies and free markets instead of structural changes of their economies aimed at broad-basing employment and income growth. These have resulted in unprecedented levels of unemployment and even rising poverty and social inequalities in their own societies. Second, the ruling classes of the major developing countries have caved in at every stage without holding a minimal negotiating position, whether in matters relating to the reform of the international monetary system or those concerning the Uruguay Round of GATT negotiations The blatant double standards of the industrial countries is to be seen in their contrasting attitude, on the one hand, denying UNCTAD the right to exercise its own mandate to discuss international monetary issues in relation to trade and development, while on the other, encouraging the World Bank to seek liberalisation of foreign trade regimes in all the indebted countries.

After the Bretton Woods system of par values collapsed, most international efforts to produce a more equitable system were scuttled by the industrial countries including the efforts by the Committee of Twenty (C-20) appointed by the IMF in July 1972. Though the C-20's initial efforts focused on the restoration of the par value system with flexibility for changing par values in an equitable and symmetrical adjustment process, the developed countries took advantage of the first oil crisis and emerging payments imbalances, usurped the initiative in the forum of the G-10, and presented the floating exchange rate system to the IMF's Interim Committee as a *fait accompli*. When the floating system was found to be considerably destabilising after it had functioned for a decade, the G-7 and G-10 summits of 1983 agreed to an international monetary conference, but the biased attitudes to multilateral institutions emanating from the Reagonomics and Thatcherite policies killed such initiatives even before they took shape. Besides, one of the most glaring failures of the international monetary system has been the asymmetrical surveillance as between the debtor and surplus countries; the IMF's plea of being helpless in this aspect is attributable to the recalcitrance of the major industrial countries. The same attitudes have worked against the augmentation of reserves through the creation of additional SDRs after the second allocation period of 1979-1981, leave alone linking the creation of additional reserves to development finance for poor countries.

New lending arrangements such as the oil facility, compensatory financing facility, the trust fund loan, the structural adjustment facility (SAF), the enhanced structural adjustment facility (ESAF) and the extended fund facility (EFF), have been introduced. But the bulk of them, as their names imply, seek structural adjustments of poor economies with sharpened conditionalities invariably in collaboration with the World Bank under its own structural adjustment loans (SALs). The introduction in April 1980 of this system of structural adjustment lendings for macro-economic policy reforms as against specific project lendings has changed the character of the World Bank's association with the borrowing countries. An internal review of the World Bank has raised significant misgivings regarding the effectiveness of SALs in low-income countries.

Even though the IMF and the World Bank have distinct, and independent mandates and cross-conditionalities have had to be eschewed by them, the result, in fact, has been precisely that and quite blatantly, as has been admitted in literature. Also, it is the uniform application of performance criteria—stabilisation policies of monetary control, fiscal compression, exchange rate depreciation, and structural policies of industrial and trade liberalisation including elimination of protection rates, tax reductions, global linkages and withdrawal of public sector activities—irrespective of the countries' stages of development, the initial conditions, and the social priorities, which has produced domestic imbalances and even social upheaval A more damaging aspect of the international economic environment for the developing countries arises because of the cross-connections that the multinational companies, banks and other financial institutions

have cultivated with multilateral agencies as a result of which private capital flows in favour of specific countries are linked to the satisfaction of the IMF and World Bank conditionalities.

What has been the impact of the working of the Bretton Woods system and its philosophy? Except for the establishment of an open and multilateral system of payments and exchange without very many multiple currency practices and discriminatory currency arrangements, all the ills arising out of the pre-war trading and financial relationships persist even now. Studies have shown how exchange rate fluctuations and their destabilising influences on the economies of developing countries have been sizeable. The LDCs have been compelled to observe successively competitive devaluations and extract export surpluses to the detriment of their domestic economies. Terms of trade have remained adverse to the commodity-producing countries in particular, and to the LDCs in general. The latest UNCTAD report for 1993 has repeatedly emphasised that even as developing countries and transition economies liberalise trade, protectionist threats and strategies of managed trade persist in developed countries. The combined package of devaluation and deflation has contributed to a catastrophic fall in living standards in a large chunk of Latin American, African and Asian economies, as also in the erstwhile communist countries. Moreover, due to the limited nature of multilateral and bilateral aid flows, net transfers in terms of long-term lendings to the LDCs have been negative now for more than a decade, suggesting reverse flow of resources. Debt flows, it has been claimed, will be replaced by non-debt flows like portfolio and direct foreign investment; but such flows are more expensive and destabilising as the bulk of them take place through portfolio investment. Dependence on direct foreign investment without it being linked to transfer of appropriate technologies has its own drawbacks. Excessive concern with the safety of MNCs' investment in the developing countries has made the World Bank set up the Multilateral Investment Guarantee Agency (MIGA). But the Bank has made no move to help LDCs prevent the supply of outmoded technologies from the developed market economies.

Have the LDCs really benefited from multilateral trade? For a fact, in the direction of world trade, imports of developed market economies from their own group have risen from 66.7 per cent during 1980 to 77.3 per cent during 1991. Likewise, the imports by the disrupted centrally-planned economies from the developed countries have risen from 22.0 per cent in 1985 to 42.9 per cent in 1991. Even in the overall world GDP, the share of developed market economies has improved from 72.6 per cent in 1982 to 74.4 per cent in 1992 which has been at the cost of the transition economies. The improvement in the share of the developing countries has, however, been only fractional.

Admittedly the newly-industrialising economies (NIEs) in south-east Asia have experienced remarkable progress during the past decade or so but their success has been due to a complex set of social, economic and political processes. Their historical and initial conditions were conducive for capital accumulation, improved labour productivity and easy absorption of the shocks of adjustment; they assigned the state a dynamic role in socio-economic development; and, they adopted progressive import substitution policies. More importantly, the NIEs and China have refused to follow the IMF-World Bank route for structural transformation of their economies. There are lessons here for the Bretton Woods institutions. But it is unlikely that 50 years of a blinkered approach will allow these multilateral institutions to even recognise these truths, leave alone learn from experience.

HUMAN RIGHTS

'First World' Records

GIVEN the record of the US and of its first world allies in overlooking the violations of the human rights by their client regimes in the third world, in actively conniving with some of these regimes in such violations, and, at places even indirectly perpetrating these violations if it served their economic, political or strategic interests, the Clinton government's concern for human rights was regarded with suspicion. Not only do gross violations of human rights continue to occur under the protected third, and now also the former second, world regimes, the issue of the human rights goes on to be selectively evoked and applied by the US and its first world allies, justifying the allegation that their apparent concern for these rights is nothing more than a foreign policy instrument, exercised to manipulate and browbeat recalcitrant regimes.

The record of the first world governments on the human rights front in the domestic sphere throws up little counter-evidence to take away the sting of such criticism. Here too, the violations are routine (though not as numerous and frequent as in certain third world societies); government action against these violations is highly selective; the perpetrators are mostly governments themselves or officials belonging to the dominant communities; and the victims, in a majority of cases, hail from the politically, economically, socially and culturally marginal groups and sections of society. In the US, for instance, in 1993, the death penalty, the most barbarous of the official infringements of the rights of the human beings, which the Amnesty International recommends be abolished and has in fact been shelved in almost half the countries in the world, claimed 38 victims, four of whom were juvenile offenders. Two of the four juvenile offenders executed were black, one had a Latin American origin, and all four came from extremely poor families. Further, both the black juvenile victims were tried before all-white juries where the prosecution had used provisions in the existing law to remove prospective black jurors; and one black and the Latino victims were assigned lawyers who had never handled a death penalty case before. Moreover, one of the black juveniles was executed despite an amendment in law, in 1991, to allow a broad range of mitigating factors to be considered, including a defendant's youth, because the amendment did not apply retroactively to prisoners, like the one in this case, who had been sentenced earlier.

This bias in law against the victims of the state violation of human rights becomes further evident from a couple of other instances from the US. Leonel Herrera, who was alleged to have murdered a police officer, was executed in May 1993. He had appealed to the Supreme Court, on the basis of new evidence presented by his lawyers subsequent to the trial in which he was sentenced to death, that he was innocent. Dismissing his appeal, the Supreme Court held that there was no constitutional right of appeal based on newly discovered evidence of innocence where the original trial was free from procedural error. In 1993, several other prisoners too were similarly murdered by the US administration despite evidence, which could not be presented at the original trial, that they were mentally impaired or retarded. At the end of the year, there were in all 2,750 prisoners under sentence of death in the US, a staggering number, especially for a country which claims to be the champion of human rights worldwide.

Similar instances of the violations of human rights and of the disregard of international covenants on protection of these rights by governments can be cited from the other first world countries. From only one source, the Amnesty International's Report for 1994, it becomes clear that the method of 'encounter' killings, or its variations, so common in the third world countries like India, is resorted to by the police and security forces of the first world countries too, and is quietly ignored by the governments. For example, in England last year an inquest into the 1991 death of Omasese Lumumba, a Zairian asylum seeker, and another into the 1986 death of Seamus McEwaine found that they had been "unlawfully killed", by London prison officials in the case of the former, and by the soldiers of the Special Air Service (SAS) in

that of the latter. In both cases, legal action against the offenders was yet be initiated by the end of the year. Another inquest, into the deaths, in 1990, of three persons killed by secret service agents, was postponed because the government attempted to exclude certain evidence from oral testimony by issuing public interest immunity certificates, which were then challenged in the court. In Germany, in June 1993, Wolfgang Grams, a suspected Red Army Faction activist, was shot dead by the police at point-blank range as he lay motionless on the ground after a police operation. In France, several unarmed people were killed by the police while in custody or during interrogation. Most of them were petty criminals or third world immigrants seeking work in France.

While such examples can be multiplied with cases from these and the other first world countries—nor, indeed, should it be expected that all such cases have been recorded and reported—mention needs to be made of the racist ill-treatment of foreign nationals, mainly of the third world countries and especially by the police. Abetted by right wing political parties and politicians and tolerated by others, due mainly to political-electoral reasons, ill-treatment of mostly poor third world immigrants has of late become endemic in all first world countries. However, Germany, France and England can be particularly singled out in this respect. It has been recorded that the perpetrators of these violations of human rights in the first world countries, mainly the police, other civil, and military officials, rarely received the requisite punishment.

This brings us to the point that needs most to be emphasised here. While the promotion of human rights as a matter of state policy in international relations cannot in itself be decried, such attempts should be viewed with the seriousness that they deserve if they are not reduced to a blatant manipulation of foreign governments for *realpolitik* interests. These attempts may even come to be appreciated if they are accompanied by a sincere attempt at promoting human rights of domestic populations, especially those among them who are weak or are otherwise on the margins of societies. Given their penchant for raising the issue of human rights in their dealings with certain third world regimes at the first opportunity, these remarks have a particular relevance for the governments in the first world.

INDIA-RUSSIA

Unreasonable Proposal?

INDIA had undertaken to repay its outstanding rouble debt at the rate of Rs 3,000 crore annually over the coming 12 years. Russia has been slow in making use of the rupee credit extended under this arrangement. The credit has to be used for the purchase of traditional items of export from India to Russia, be it tea or tobacco. In order to accelerate the utilisation of the rupee credit, the Russians propose to auction part of this credit.

It is worthwhile recalling that the original arrangements, with regard to the settlement of India's rouble debt were objected to in several quarters within India as being overly generous. The main argument was that when it suited Soviet Union it chose to denominate the debt in rouble. Then the rouble's exchange rate had been pegged rather high. Later, when the rouble lost its international exchange value it was allowed to get the rouble debt of India to be converted into a rupee debt at the exchange rate which was rather high. The requirement that under the changed arrangements for the newly denominated debt, the rupee credit has to be spent for the purchase of traditional export items was not new at all. In fact, this was only an extension of the old bilateral payments arrangement between India and the Soviet Union.

The question now is whether the Russian proposal to auction part of its rupee credit will, in any way, violate the arrangements under which the credit has been opened. There is no suggestion on Russia's part that the credit thus released through auction can be utilised in India for purchases other than the traditional export items covered under the arrangement. As for the argument that the credit thus released could fall into hands which would otherwise have had to make such purchases with convertible currencies, is such fear not being overstated? After all, even during the Soviet era, there were complaints that the Soviet purchases from India trickled to other countries. Even if there were no auction of rupee credit and all purchases in India made out of the credit were by Russia's public sector units, is there any way we can prevent such purchases being resold to other countries?

There is also another fear, namely, that the auction of rupee credit at a discount will mean effective devaluation of the rupee, even though it is only for the limited purpose of Russian purchase out of the special credit facility. However, the situation right now is of the rupee being kept artificially below the international value it would otherwise command, pegged as it virtually is, to the US dollar, through the accumulation of dollar holdings. At least for now, there is little to fear on this score.

All that Russia is proposing to do through the medium of auctioning its rupee credit is to overcome its own internal organisation problems in the utilisation of its credit. Of course, we have to be watchful that the credit thus released is used for the purposes provided for.

PHARMACEUTICALS

Cosmetic Gesture

IN July 1983 the government of India banned by a gazette notification 21 categories of drugs. This list, formulated after great deliberations included drugs which were hazardous (such as amidopyrene, phenacetin, fixed dose combinations of atropine/belladona/homotropine, etc. in analgesics and antipyretics, syrychnine and caffeine in tonics, etc) as well as irrational combinations such as vitamins with anti-TB drugs and irrational formulations like, liquid tetracycline. This list, it is well to remember, came after a long process of examination. A subcommittee of the Drug Consultative Committee had, in 1980, recommended for weeding out immediately, a list of 16 drugs, with seven others to be withdrawn over a period of time. On the basis of this, the Drug Technical Advisory Board (DTAB) in 1982 had, advised the banning of only 12 drugs with immediate effect, with four others to be banned in the course of time. The gazette notification of 1983 went mostly by the recommendations of the DTAB, but added some others.

In short, it took three years for the government of India to issue a notification banning drugs which were known to be hazardous or irrational. Since then, seven more drugs have been officially banned. But other than issuing gazette notification, there is little, clearly, that the government has done to ensure that the banned drugs have indeed been withdrawn and their manufacture has been discontinued. For, a recent writ petition filed in the Supreme Court has drawn attention to the fact that these drugs continue to be available, and quite easily and openly, in many parts of the country.

This state of affairs exposes the various interest groups at work within the concerned ministries. Clearly, there is a section which sees the necessity of bringing some semblance of rationality to the proliferating drug market. Such institutional requirements as experts committee reports and the recommendations of the drug technical advisory board are sought to be given due weightage. However, it is equally obvious that the concerned ministries have neither a mechanism to inform the public about the banned drugs, nor even an efficient machinery at the states level to enforce the ban at the manufacturers and dealers end. The result is that the ban notifications become cosmetic gestures, which are known only to the drug control authority, the manufacturers and the dealers. Since the manufacturers' concern is not with the health and well-being or safety of people, in the first place—for, if it had been so, they would not have

been manufacturing the drugs at all—they circumvent the ban in various ways: by changing the packaging, the market areas, etc, or by challenging the order in court on flimsy grounds (such as loss of returns on investment, etc).

In February, the drug controller recommended a list of six anti-diarrhoeals to be banned. This came after many years of pleading from experts in the field who pointed out that the large number of anti-diarrhoeals available were not only unnecessary but could prove to be dangerous. As a result of this ban order, 36 formulations now stand banned. However, unless the drug controller makes an effort to publicise the ban as well as enforcing it, these drugs too will continue to be available, exposing people, especially children, to drugs which have been proven to be harmful.

WORLD BANK-IMF

Celebrating Non-Achievements

THIS is the year when the World Bank/IMF twins complete 50 years of existence, and it is certain that these institutions and their promoters will try to have them evaluated in the most glowing terms and to project for them an even more glorious future. The fact remains that neither body has come anywhere close to what it was supposed to achieve originally. The IMF was supposed to perform as the central bank of the world, as not only the lender of last resort for the national level central banks but also a sort of custodian of the exchange rate regime, exercising what was called 'term surveillance' over the exchange rates of the national currencies of the world. The World Bank was supposed to be the supreme international development bank, the lender of medium- and long-term finance all the world over. Would Keynes, one of the principal players when these twin institutions were on the anvil, feel like congratulating himself on their performance today?

As is well known, the ultimate shape these institutions took on was nowhere near what Keynes would have liked them to be. Keynes' primary concern was to see that the institutional movement of finance should be subject to some control and regulation and not left to the market, which he found to be totally fickle and unreliable. With this objective in mind he proposed that generation of international liquidity should be entrusted only to an international organisation. He did not succeed in getting the Americans to agree to that; they would simply not agree to a supernational body taking over the role what they thought was their country's birthright! Not even when the US was given the veto over decisions in such a body. So, what could be agreed upon was an institution with the task of surveillance over exchange rate movements. The underlying assumption was that exchange rate movements reflected the movement of funds across frontiers and therefore, surveillance of exchange rate movements meant indirectly overseeing movements of international finance.

As it has turned out, with the devise of the fixed exchange rate system by the early 70s and the subsequent spurt in the movement of funds across frontiers, the IMF has been reduced to extending payments support to only the developing countries, playing virtually the role of a mere spectator in the arena of international finance. The World Bank has lost its relevance in regard to meeting international requirement of longer term finance of the industrial countries. These countries could tap other sources, sources of finance which would not oblige them to be subjected to the sort of policy these international institutions tried to impose.

That World Bank/IMF support to member countries, or rather, the developing member countries only, has been coming down in absolute terms, and that too unadjusted for price changes, is the least important of factors behind the marginalisation of these twins. The really important factors are, firstly, that in the generation of international liquidity the IMF has virtually no role—what little opening it had been allowed through the issue of SDRs, the major portion of which accrued to the developed member countries, was also slummed shut—and, secondly, that in their effort to augment their own resources these institutions were blocked at every stage.

Today the World Bank/IMF are reduced to institutions lording over the developing countries at the bidding of the US and other industrial countries which control their decision-making. These so-called multilateral institutions are today sought to be controlled by the dominating cabal with far greater impunity than ever before in these past 50 years. This is in line with the open attack on the concept of multilateral institutions that started during the years of the Reagan presidency in the US.

While making an assessment of the 50 years of the Bretton Woods institutions one should not ignore the future, particularly since a new institution, the World Trade Organisation, is about to be installed, replacing GATT. Will this new institution, multilateral on paper no doubt, be sufficiently impervious to the sort of pressures that the World Bank/IMF are constantly exposed to? Or will it just function to keep the developing member countries on a leash while allowing the developed countries, especially the US, to go their non-merry way?

TWENTY YEARS AGO

EPW, July 20, 1974

The Planning Commission wants no part of the onus for creating a 'revolutionary situation'. The country's economic prospects being what they are, children sent to school would, at the end of their schooling, find no jobs; as a consequence, they might be up to all kinds of mischief, including, for all one can surmise, the creation of 'revolutionary situations'. The commission as a responsible body, must put its foot down against schemes and proposals which have such dangerous possibilities. It is not given to it to plan and implement the generation of additional employment opportunities; it can, however, certainly recommend drastic reduction in the financial outlay for school-level education, so that the problem of the unemployed educated turning revolutionaries can be nipped in the bud.

The Planning Commission has applied itself to this task with great zest. The Approach to the Fifth Plan had talked of 75 per cent enrolment in the age-group of 11 to 14 during the Plan. The draft Plan pruned this target to 47 per cent. But as awareness about the functional relationship between education with no jobs at the end of it and germination of revolutionary situations has further sunk in, the target has been even more severely slashed: in the age-group of 11-14, only 31 per cent, it has now been decided, need be enrolled in schools during the Fifth Plan—in case there is to be such a thing. This need not be the end of the narration· wait for the subsequent bulletins and it is possible that some more cuts are in the offing.

The story is repeated in regard to primary education. The Approach paper had set a breathtaking target of 100 per cent enrolment in the age-group of 6 to 11. The Draft Plan scaled it down to 97 per cent. The target has now been further reduced to 90 per cent. Going by the drift of things, very soon one might expect a tacit admission that no expansion of primary education beyond what obtains at present is feasible in the Fifth Plan!

Perhaps there is a method in this Planning Commission madness. The children of the poor millions, once they attain maturity, are in any event bound to discover that, with the country's social and economic progress at a dead halt, the prospect of joblessness and meagre earnings continues to stare them in the face. They might begin to think on their own, read on their own, and appreciate the relevance of class analysis for explaining the nature of the crisis confronting the nation. This must seem a most perilous thing, affecting the stability of the system, to those handful who receive the special bounties of it. On the other hand, if the overwhelming majority of the children of the nation's poor are denied all education, while they would still remain discontented, it could be easier to channel their discontent along 'desirable' lines: the wrath of the uneducated unemployed, for instance, could be mobilised not against the system and those few who enormously profit from it, but against the organised working class. The Planning Commission, one almost begins to suspect, knows what is what; it has a charter to create *lumpen* elements in society, and it is going about the job with considerable gusto and acumen.

S S Organics

S S ORGANICS which was setting up a new unit for manufacturing 48 mtpa of mebandazole, 36 mtpa of norfloxacin and 12 mtpa of atenolol in addition to various other intermediates has decided to go in for manufacture of a more remunerative product mix comprising 18 mtpa of terfenadine, 48 mtpa of mebandazole and 12 mtpa of atenolol due to the fluctuation in the prices of bulk pharmaceuticals. The project costing Rs 8.25 crore is to be partly financed through a public issue of 30,00,000 equity shares of Rs 10 each at par which will open for subscription on July 25 and will be lead managed by SBI Capital Markets and Merbanc India. The project which is located about 76 kms from Hyderabad in the Medak district is expected to commence commercial production in July this year. The company has entered a marketing arrangement with the ICD group BV, Netherlands whereby ICD will purchase 36 mtpa mebendazole and 12 mtpa of atenolol for a period of five years.

JK Dairy

JK Dairy and Foods which has been promoted by Straw Products and JK Industries, is setting up an international standard plant for manufacturing ghee, dairy whitener and whey powder. Located at Gajraula, a surplus milk belt area in Uttar Pradesh, the project is being set up at a total outlay of Rs 30 crore and was expected to commence commercial production in June this year. To part finance the project the company will enter the capital market with two simultaneous and unlinked public issues of 17,60,000 equity shares of Rs 10 each at par aggregating Rs 176 lakh and 32,50,000 15 per cent secured redeemable partly convertible debentures (PCDs) of Rs 25 each for cash at par aggregating Rs 812.5 lakh. The convertible part of Rs 10 of each PCD will be converted into one equity share at par on allotment while the non-convertible part of Rs 15 will be redeemed in three equal annual instalments beginning from the expiry of the sixth year from the date of allotment. For those interested in selling off the khoka portion the company has made arrangements with HMG Financial Services Company for buying it at Rs 12.

East West Travel

India's largest private airlines and travel agency, East West Travel and Trade Links plans to enter the capital market with a Rs 55.2 crore public issue on July 28. The issue consisting of 1,38,00,000 equity shares of Rs 10 each which are being offered at a premium of Rs 30 per share will be lead managed by IDBI, SBI Capital Markets and Indbank Merchant Banking Services. The company is an established profit-making member of the International Air Transport Association (IATA) and has long-standing relationships with several international airlines. It has a wide network of offices and agents all over the country for ticketing and allied services and presently operates to more than 25 destinations on major trunk routes, feeder routes and tourist destinations all over India. The airline which was awarded 'Best Inflight Service and Inflight Entertainment' award by the JD Institute of Fashion Technology has established maintenance facilities, trained manpower, training and upgrading facilities in addition to an engineering set-up for maintenance facilities up to 'C' check and has interline agreements for carrying international passengers on domestic routes with Air India and 17 other major international airlines. The proceeds of the company's public issue will go towards financing the acquisition of fixed assets for its airline division (Rs 16 crore): repayment of bridge loans with accrued interest (Rs 21.9 crore); margin money for working capital (Rs 13.8 crore); and public issue expenses (Rs 3.5 crore).

Narmada Chematur

Narmada Chematur Petrochemicals (NCP), a joint venture between Gujarat Narmada Valley Fertilisers Company (GNFC) and Chematur AB of Sweden with equity contribution up to Rs 77.1 crore (62.5 per cent of the project cost), is entering the capital market with a public issue of 2,31,15,000 equity shares of Rs 10 each which are being offered at a premium of Rs 10 per share. The issue is to part finance NCP's Rs 308.2 crore project for the manufacture of aniline and toluene di-isocyanate (TDI) which is being set up at Narmadanagar in the Bharuch district of Gujarat, within the existing premises of GNFC. TDI is a 100 per cent import substitute product while aniline has good export potential. The first phase of the project which involves setting up the aniline and offsites projects is expected to go into production in October this year while the second phase consisting of the TDI project is expected to be commissioned by December 1996. The public issue which will open for subscription on August 1 will be lead managed by IDBI and J M Financial and Investment Consultancy Services.

Alufluoride

Alufluoride which has been promoted by V S Prasad and K Ramachandra Reddy is setting up a plant for the manufacture of 4,500 tpa of aluminium fluoride at Visakhapatnam in Andhra Pradesh. The project will source its raw material, fluorine pollutants, from the phosphoric acid plant of Coromandel Fertilisers and will use technology supplied by Navin Fluorine Industries, a division of Mafatlal Fine Spinning and Manufacturing Company. The project which is estimated to cost Rs 17.5 crore is to be part finance through a public issue of equity shares of Rs 10 each at par aggregating Rs 2.6 crore and is expected to commence commercial production this month. The issue will open for subscription on July 20.

Ashima Syntex

Ashima Syntex which has been co-promoted by Anagram Finance, Chintan N Parikh and Sanjay S Lalbhai, is entering the capital market with a public issue of equity shares which will be offered at a premium of Rs 40 per share. The issue is to part finance the company's diversification programme envisaging the setting up of a composite denim plant for the manufacture of indigo-dyed, pre-shrunk, 100 per cent cotton 14.5 Oz classical denim fabric. In addition to this project which will have an installed capacity of 10.6 million metres per annum the company has also finalised an agreement with Mihir Textiles to increase its licensed capacity to 56,528 spindles and 472 looms. The project which is estimated to cost Rs 71.5 crore is expected to commence commercial production by October 1994. The company's public issue aggregating Rs 32.8 crore will open for public subscription on July 19.

Vardhman Polytex

Vardhman Polytex plans to come out with a rights issue of equity shares in the ratio of one share at a premium of Rs 60 for every share held and non-convertible debentures (NCDs) of Rs 250 each in the ratio of two NCDs for every five shares held. The issue is to part finance the company's project for expanding its existing spinning capacity at Bhatinda; the setting up of a 100 per cent export-oriented unit with a capacity of 25,000 spindles at Bhatinda; other normal capital expenditure and additional margin requirements. The expansion project will be implemented in two phases, the first involving the installation of spindles is partly complete and is expected to be fully commissioned by October, while the second phase is expected to be completed by the first quarter of the next financial year. Each NCD will carry two detachable warrants which will be converted into two equity shares, one after the second year and the other after the fourth year at a price of Rs 30 each including face value of Rs 10 and a premium of Rs 20.

Equity prices in the Indian stock markets have improved with the BSE Sensitive and National Indices rising by over 90 per cent over the year. Net investment by FIIs are continuing at about $ 200 million a month. Foreign exchange assets (other than gold) have crossed US $ 16.4 billion. While bank deposits have grown at an accelerated rate of 4.3 per cent during the current fiscal year, non-food advances have registered an absolute fall. Amongst major industries, automobiles sector has done well; food processing industries have suffered a set back as have some of the metal industries.

SCHEDULE 17—NOTES TO ACCOUNTS

1. ACCOUNTING POLICIES
   a) Accounting Conventions
   The Financial Statements are drawn up in accordance with historical cost convention except in case of Commission on Guarantees & Letters of Credit and Payments under the Early Voluntary Retirement Scheme of 1988, which are accounted on cash basis. Fees earned on Portfolio Management Scheme are accounted on the maturity of the Scheme in accordance with the directives of the Reserve Bank of India (RBI)
   b) Foreign Currencies
   Assets and Liabilities in foreign currencies, except for non resident deposits in FCNR (A) Accounts, are translated into Indian Rupees at rates current at Balance Sheet date as prescribed by FFDAI The net exchange difference arising thereon is charged or credited to profit and loss account
   c) Investments
   Investment Securities are valued at cost plus discount (if any) accreted till date.
   Trading Securities are valued at lower of cost and market value as prescribed by the RBI vide its circular DBOD No BP.BC.59/21 04.043/94 dated May 17, 1994 from the Financial Year 1993-94. Had this charge not been effected, profits for the year would have been higher by Rs 85,396,596 (net of tax Rs 34,158,638).
   d) Fixed Assets
   Fixed Assets other than Immovable Properties (refer Note 2), are stated at cost less accumulated depreciation. Depreciation is charged on the straight line method, at rates higher than those prescribed in Schedule XIV of the Companies Act, 1956, as per the global policy of the Bank
   e) Advances
   Provisions for doubtful advances have been made to the satisfaction of the auditors and in accordance with the norms prescribed by the RBI, based on a periodic review of advances, and after taking into account the portion of advance guaranteed by the Deposit Insurance and Credit Guarantee Corporation, the Export Credit and Guarantee Corporation and similar statutory bodies.
   f) Staff Benefits
   Provisions for gratuity/pension benefits to staff have been made on an accrual basis except for the liability mentioned in Note 3 Separate funds for gratuity/pension have been created.
2. Immovable properties were revalued on March 10, 1993, resulting in an increase of Rs. 78,437,153.
3. The liability pertaining to employees who retired under the Bank's Early Voluntary Retirement Scheme of 1988 is being accounted for as and when it falls due under the Scheme. The liability under the Scheme as on March 31, 1994 as actuarially determined is Rs. 7,226,000
4. Investments include:
   a) Bonds valued at Rs 19 44 million (face value Rs 21 35 million) which were misplaced in transit in 1990 and 1991. Necessary action in terms of lodging FIRs with the Police and notifying the issuers of the bonds has been taken. The Bank continues to hold valid legal title to the bonds as their registered owner

Bank of America

BANK OF AMERICA NATIONAL TRUST & SAVINGS ASSOCIATION (INDIAN BRANCHES)

SCHEDULES FORMING PART OF THE PROFIT AND LOSS ACCOUNT FOR THE YEAR ENDED MARCH 31, 1994

b) Bonds valued at Rs. 182.72 million (face value Rs. 220 million) currently registered in the name of a third party which has been notified under Section 3(1) of the Special Court (Trial of Offences Relating to Transactions in Securities) Act, 1992

5. Claims aggregating to Rs. 561.45 million have been made on the Bank by another bank on account of securities that were allegedly not delivered. The Bank has disputed these claims and has been legally advised that they are not tenable.

6. A Claim of 37 million Units of Unit Trust of India (face value Rs. 10 each) has been made on the Bank by the custodian under the Special Court (Trial of Offences Relating to Transactions in Securities) Act, 1992 on account of an alleged transaction with a notified party. The Bank has disputed this claim and has been legally advised that it is not tenable

7. The Bank has furnished explanations to the RBI in response to the Special Audit Report on the Bank's securities operations, under Section 30(1B) of the Banking Regulation Act, 1949. The financial impact, if any, will be provided for upon completion of action by the RBI.

8. Demands to the extent of Rs. 301.98 million, raised by the Income-Tax authorities in respect of Assessment Years 1990-91 and 1991-92, have not been provided since these are being contested in appeal

9. Previous year figures have been regrouped and reclassified wherever necessary.

AUDITORS' REPORT

We have audited the attached Balance Sheet of the Indian branches of Bank of America National Trust and Savings Association as at 31st March, 1994 and also the Profit and Loss Account of the Indian branches of the Bank for the year ended on that date

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Sub-Section (1), (2) and (5) of Section 211 and Sub Section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account, together with notes thereon, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore, drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

We report that:

(a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit, and have found them to be satisfactory.
(b) The transactions which have come to our notice, have been in our opinion, within the powers of the Bank
(c) In our opinion, proper books of account as required by law have been kept by the Bank so far as appears from our examination of those books.
(d) The Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account.
(e) Reference is invited to Notes in Schedule 17 regarding investments (Note 4), claims made by other banks on account of securities allegedly not delivered (Note 5), claim made by Custodian under Special Court (Trial of Offences relating to Transactions in Securities) Act, 1992 (Note 6), and the financial implication arising out of Special Audit Report u/s. 30(1B) of the Banking Regulation Act, 1949 (Note 7).

Subject to the above, in our opinion, and to the best of our information and according to the explanations given to us, the said accounts read with other notes thereon give the information required by the Companies Act, 1956, in the manner so required for Banking Companies, and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branches of the Bank as at 31st March, 1994 and the Profit and Loss Account gives a true and fair view of the Profit of the Indian Branches for the year ended on that date.

GRASIM INDUSTRIES

Eco-Friendly Strategies

GRASIM INDUSTRIES, the flagship company of the Aditya Birla group with interests in such diverse fields such as viscose staple fibre (VSF), pulp, caustic soda, chlorine and other ancillary chemicals, textiles, engineering and cement saw a fall in its operating profit in 1992-93 with a sharp rise in operating expenses. Production remained stagnant or low in most of the company's divisions and the cement division, the only one to witness a rise in production from 14.9 lakh tonnes in 1991-92 to 19.2 lakh tonnes in 1992-93, saw poor offtake due to the sluggish demand by the government sector. The company managed to show a rise in net profit primarily due to the lower rise in interest burden and a fall in tax provision over the previous year.

Margins at the VSF division continued to be affected due to the exorbitantly high incidence of excise duty on VSF as compared to other major man-made fabrics and the marginal reduction of the said duty in the budget proved to be totally inadequate. Major overhauling and replacement work at the pulp division which involved equipment such as economiser and electrostatic precipitator in the recovery boiler affected production of rayon grade pulp. Production of caustic soda, chlorine and other ancillary chemicals also fell due to a major fire in the caustic soda unit no 1.

Meanwhile in response to the growing demand in both the domestic and international markets the company increased its production capacity for VSF during the year and has plans to undertake further expansion of its capacity. Its newly introduced 'Grasi-high' and 'Grasi-silk' varieties of VSF were reportedly well received by the users in the textile industry. The company received Indian Chemical Manufacturers Association's award for environmental control strategies and safety in chemical plants for 1991 following the successful introduction of a more innovative oxygen bleaching process (for the first time in the country) in the conventional chlorine-based system which helped reduce the cost of bleaching and improved pulp quality. The commissioning of a new captive power plant of 25 MW capacity at the chemicals division at Birlagram in Nagda is expected to reduce production losses due to frequent power cuts and also help in achieving self-sufficiency in power. A major modernisation programme involving the introduction of membrane cell technology was expected to be commissioned in the second quarter of 1994.

The company's US $ 90 million Euro-issue represented by global depository receipts evidencing global depository shares at a price of US $ 12.98 per share (inclusive of premium) during the year was well received. Meanwhile the company has notched a net profit of Rs 228 crore on net sales of Rs 2,202 crore for 1993-94 representing a 64.9 per cent and 52.8 per cent, respectively, over that in 1992-93.

JCT

Export Plans

A part of the Thapar group of companies, JCT was incorporated way back in 1946 for the manufacture of textiles. Through the merger of two smaller companies, JCT managed to diversify its product range to include polyester filament yarn and steel in addition to an exports division and its original textile division. The continued recessionary trends, heavy incidence of excise duty on filament yarn, increasing costs of inputs on account of the convertibility of the rupee, upward revisions of power tariffs in the state of Punjab and the scarce and expensive funds position in the market all took their toll on the companies operating profit. Consequently though net sales in 1992-93 improved by 11.5 per cent over the previous year, operating profit failed to keep pace and saw a rise of a mere 8.7 per cent. The higher non-operating income for the year coupled with the lower rise in depreciation charges however helped the company to shore up its bottomline by more than 100 per cent. The company maintained the dividend rate at 20 per cent though this entailed a higher dividend outgo following a sharp rise in the company's equity capital.

Production of yarn, cloth and polyester filament yarn improved from 12,616 mt, 523.7 lakh metres and 2,812 mt, respectively in the previous year to 13,922 mt, 634.5 lakh metres and 2,973 mt in 1992-93. On the other hand production of nylon filament yarn and synthetic and cotton fabrics fell from 3,550 mt and 80.7 lakh metres, respectively in 1991-92 to 3,292 mt and 58.6 lakh metres. Sale of cloth and polyester filament yarn was higher at 614.6 lakh metres and 3,057 mt, respectively as against 502.6 lakh metres and 2,705 mt sold last year. However, sale of yarn and nylon filament yarn fell from 2,045 mt and 3,543 mt, respectively, in the previous year to 1,505 mt and 3,208 mt.

Meanwhile with the government announcing major duty reliefs both in excise and customs in the budget, the textile and filament yarn industries showed signs of revival. The company has installed 29 sulzer weaving machines in addition to the latest machineries to make high quality fabrics both for the domestic and export markets. To cater to the export market the company plans to install additional sulzer machines. Further the textile division is being modernised in order to make value added cotton fabrics and the company has also undertaken expansion of its filament yarn capacity at Hoshiarpur. The expansion and modernisation programmes at the textile and filament yarn divisions which are to cost up to Rs 200 crore are to be implemented in a phased manner. The company's subsidiary, JCT Fibres which is engaged in the manufacture of polyester staple fibre has turned around in 1992-93 and has increased its share in the domestic market. JCT Fabrics which continues to operate at full capacity and is eligible for benefits of an export house proposes to expand its polymer capacity. With JCT's two rights issue of an aggregate value of Rs 221.5 crore, its equity capital has more than doubled to Rs 73.3 crore. Meanwhile the company has notched a net profit of Rs 37.6 crore on a net sale of Rs 444.6 crore for 1993-94.

HINDUSTAN CIBA-GEIGY

New Products

Hindustan Ciba-Geigy, a Rs 380-crore company which is engaged in the manufacture of such diverse products as pesticides, dyestuffs and chemicals, consumer health care products, pharmaceuticals, additives, polymers, pigments and composites saw a fall in its bottomline in 1992-93. Despite a 17.3 per cent rise in net sales and a 36.9 per cent rise in operating profit during the year, a sharp rise in interest charges and depreciation provision coupled with the burden of a VRS introduced at its plant in Bhandup took their toll on the company's profitability. Despite the fall in net profit the company has raised the dividend rate from 20 per cent in 1991-92 to 25 per cent.

The dyestuffs and chemicals (D and C) division and the additives, polymers, pigments and composites division which were the only divisions which showed an improvement in production over the previous year managed to shore up the company's value of production by 5.0 per cent during the year. While the former saw a 43 per cent rise in its business mainly due to a sharp rise in its exports, the latter's margins were under pressure due to the severe recession and the competition from cheap imports from south-east Asia. Notwithstanding the rise in exports of dyes and dye intermediates, the disintegration of

the erstwhile USSR led to a fall in the company's exports (primarily that of pharmaceuticals) by more than 40 per cent. The healthcare division also saw a slow market growth and heavy competition.

The company commissioned its new 2,800 mtpa mononcrotophos plant at the Santa Monica works. The antioxidants project at Goa is to be implemented in phases from 1993-94 onwards and the company is also considering the introduction of new self-medication products and a new gel toothpaste. Meanwhile for the first six months of 1993-94 the company's profitability improved sharply and on a net sale of Rs 227 crore it earned a net profit of Rs 14.9 crore as compared to a net profit of Rs 12.9 crore and net sales of Rs 213.6 crore in the corresponding period last year.

ETERNIT EVEREST

Waste Reutilisation

A member of the Eternit group of Belgium which is a world leader in fibre cement products, Eternit Everest improved its performance in 1992-93 posting a 20.3 per cent higher operating profit on a 16.3 per cent larger net sales for the year. Despite a sharp rise in interest charges, depreciation provision and taxation the company managed to improve net profit by 22 per cent over that in 1991-92 primarily due to a lower non-operating loss as compared to last year. Despite the rise in profitability the company maintained the dividend rate at 30 per cent.

Production and sale of asbestos cement products during the year were lower at 1,45,268 mt and 1,38,195 mt as compared to 1,62,825 mt and 1,61,556 mt, respectively, in 1991-92. Despite the curtailment of production in tune with the lower demand and sale following the severe recession in the industry which actually deepened in the latter part of 1992-93 with the civil disturbance in the country, the company managed to improve profits and turnover mainly due to control on costs and optimum raw material mix utilisation. The use of specified waste materials in the production process helped the company to avail of certain fiscal incentives (linked with such use) under the government's environment policy.

The company's R and D centres at Bangalore and Kymore which are recognised by the department of science and technology plan to optimise raw material utilisation and are directing their efforts at material substitution, improvement of existing products and development of new products. These efforts seem to have paid off with the introduction of three new products—two in the roofing segment and one for interiors—in selective markets. The company plans to commence commercial marketing of these new products following the conclusion of test marketing. The company which pioneered the manufacture of fibre cement products in the country and has maintained its leadership position for over 50 years is now pursuing an aggressive diversification programme with technological support from its parent company. For the six months ended September 1993 the company earned net profit of Rs 4.1 crore on a net sale of Rs 54.7 crore as against a net profit of Rs 4.6 crore on a net sale of Rs 59.3 crore in the corresponding period last year.

BHARAT BIJLEE

Profitable Collaboration

After distributing bonus equity shares in a liberal ratio of one share for one held in 1991-92, Bharat Bijlee which is engaged in the manufacture of electric equipment such as motors, transformers and lifts saw a fall in profitability in 1992-93. While the company's net sales rose by 11.2 per cent over the previous year, operating profit fell by 8.6 per cent. A sharp rise in interest charges led to a 12.8 per cent fall in gross profit and a 14 per cent fall in net profit. Consequently the company has had to curtail the dividend rate to 22 per cent as against a dividend rate of 25 per cent last year. Despite this, dividend outgo has doubled following the company's bonus issue last year leading to lower retained earnings for the year.

Sale and production at the company's motors division fell to 2,29,000 (2,39,000) and 2,12,000 (2,37,000) motors, respectively, while sale realisation fell to Rs 29.2 crore (Rs 30.5 crore) with the persistent stagnant demand and pressure on margins. The lift division did not show a noticeable rise in sale with a fall in production from 337 lifts in 1991-92 to 314 lifts in 1992-93 while turnover at the project division was lower. Production and sale at the transformer division on the other hand improved to 1,493 transformers and 1,535 transformers, respectively, while sale realisation improved to Rs 56.3 crore as against Rs 45.8 crore in the previous year. The company's technical collaboration agreement with Siemens Ag of Germany for the manufacture of power transformers seems to have benefited the company with exports improving considerably and the company competing successfully in the international market for transformers. Exports accounted for about 5.0 per cent of net sales as against a mere 1.0 per cent last year. The company also has a technical collaboration agreement with Inventio Ag of Switzerland for lifts.

With lower average price realisation expected in 1993-94 margins are again expected to be under severe pressure at the transformer division. Turnover is expected to improve in 1993-94 with the lift division's increased proportions of high technology installations. Meanwhile for the first six months of 1993-94 the company suffered a net loss of Rs 83 lakh on a net sale of Rs 35.5 crore as against a net profit of Rs 1.2 crore on net sales of Rs 48.6 crore in the corresponding period last year.

For a New Debate on West Bengal

G K Lieten

Steering between the two extremes of contemptuous dismissal and unqualified acclaim, the neutral observer may readily admit that the panchayat system and the process of rural reforms in West Bengal have done reasonably well, and that this is the fountain-head of its success. After almost two decades of LDF sway, it is, however, important to do some creative thinking on new initiatives.

TO many observers, it remains surprising: the communist-dominated Left Front government in West Bengal has remained in power for almost two decades now. It has stood the test of numerous national, provincial and local elections. It has seemingly remained largely unaffected by the ever increasing churning in Indian politics. Steering between the two extremes of contemptuous dismissal and unqualified acclaim, the neutral observer may readily admit that the panchayat system in West Bengal has done reasonably well, and that this is the fountain-head of its success.

After the fourth panchayat elections, on May 30, 1993, the general impression has been created that the LFG was swiftly losing ground and tried to hit back by instigating violence against its opponents. The first newspaper reactions to the panchayat elections, however, were positive. *The Statesman*, for example on June 1 published an editorial 'The Colour is Red' which ended as follows: "Crocodile tears and accusations of unfair polls by the Opposition notwith-standing, the CPI(M) is entitled to be satisfied with its record". *The Telegraph* was of the opinion that the party "remains the best bet for representing rural interest and aspirations", and that accusations of unfair practices were 'a tearjerker'.

VIOLENCE

Soon afterwards, however, altogether different stories started to get into the limelight. The Mamata line of street bravado and the ghastly killings of opponents by CPI (M) supporters led to a collective change in the media. *The Telegraph* was quick to react. In an editorial on June 3 ('Power and Gory') it stated that S S Ray's terror in the early 70s helped the CPI(M) coming to power, but that "having untrammelled power, the CPI(M) may end coming up a full circle for it". Dipanker Bhattacharya (*EPW*, July 17, 1993: 1493) brought in a new dimension: since the CPI (M) had become a party of jotedars and rich peasants, its used intimidation, constant terror and ultimately the carnage near Memari in order to fight back the struggling alliance of poor people.

The most authoritative story on the 1993 panchayat elections appeared in *Mainstream* (June 26, 1993). It was written by D Bandopadhyay, the secretary in the West Bengal department of land reforms in the early 1970s, and recently co-author of a study on panchayats in West Bengal, commissioned by the state government [Nirmal Mukarji and Debabrata Bandopadhyay 1993].

Bandopadhyay starts his contribution with mentioning a number of positive points, which he repeatedly contributes to the credit of all the parties. When it comes to the performance of the Left Front and of the CPI(M) in particular, he turns very critical. Not only have many of its noble plans (land reforms and barga registration for example) not lived up to the promises made in 1977, the whole system has become fairly bureaucratised: "The elan and vitality with which the panchayats had started in 1978 got dissipated and it became in many a place a lifeless and sterile elected administrative structure" [Bandopadhyay 1993: 18]. He further argues that the contractors, usurers and middlemen have started waiving the red flag and have taken over the panchayat power: "That is why we find the Panchayats running out of steam in terms of ideas, innovativeness and emphatic response to major social and economic issues which confront the poor and the less affluent" (:20). In the last elections, Bandopadhyay argues, many of these middle class elements were dislodged from power; they felt threatened and took revenge in violent acts. The blame for all this "falls squarely on the shoulders of the leadership. They should do some sincere introspection...instead of resorting and mayhem of the poor" [Bandopadhyay 1993: 18].

Debabrata Bandopadhyay seems to have overlooked two basic facts: the level of violence, measured in terms of victims, was three times higher than the 1988 level which again was one-third of the 1983 level. On the basis of these fluctuating figures, it would be imprudent to rush to conclusions. In the second place, in the elections the CPI(M) has surely not done as badly as most analysts have argued. Yes, there has been a decline from the 1988 results, around 5 per cent in votes and 8.5 per cent in seats), but then again there was a 10 per cent upward swing in comparison with the 1991 assembly elections, and a 4 per cent increase in comparison with the 1983 panchayat elections.

We would therefore prefer not to follow Bandopadhyay in his analysis, and will look at some of the positive developments which have taken place in West Bengal, and which have culminated in seesaw changes again in the 1993 election. These seesaw changes appear to have been overlooked by most observers. One underlying process, only to be mentioned briefly but of paramount importance, has been the breach in the tenuous hold of landlords and rich peasants on rural politics and economics.

WOMEN AND POOR PEOPLE TO THE FORE

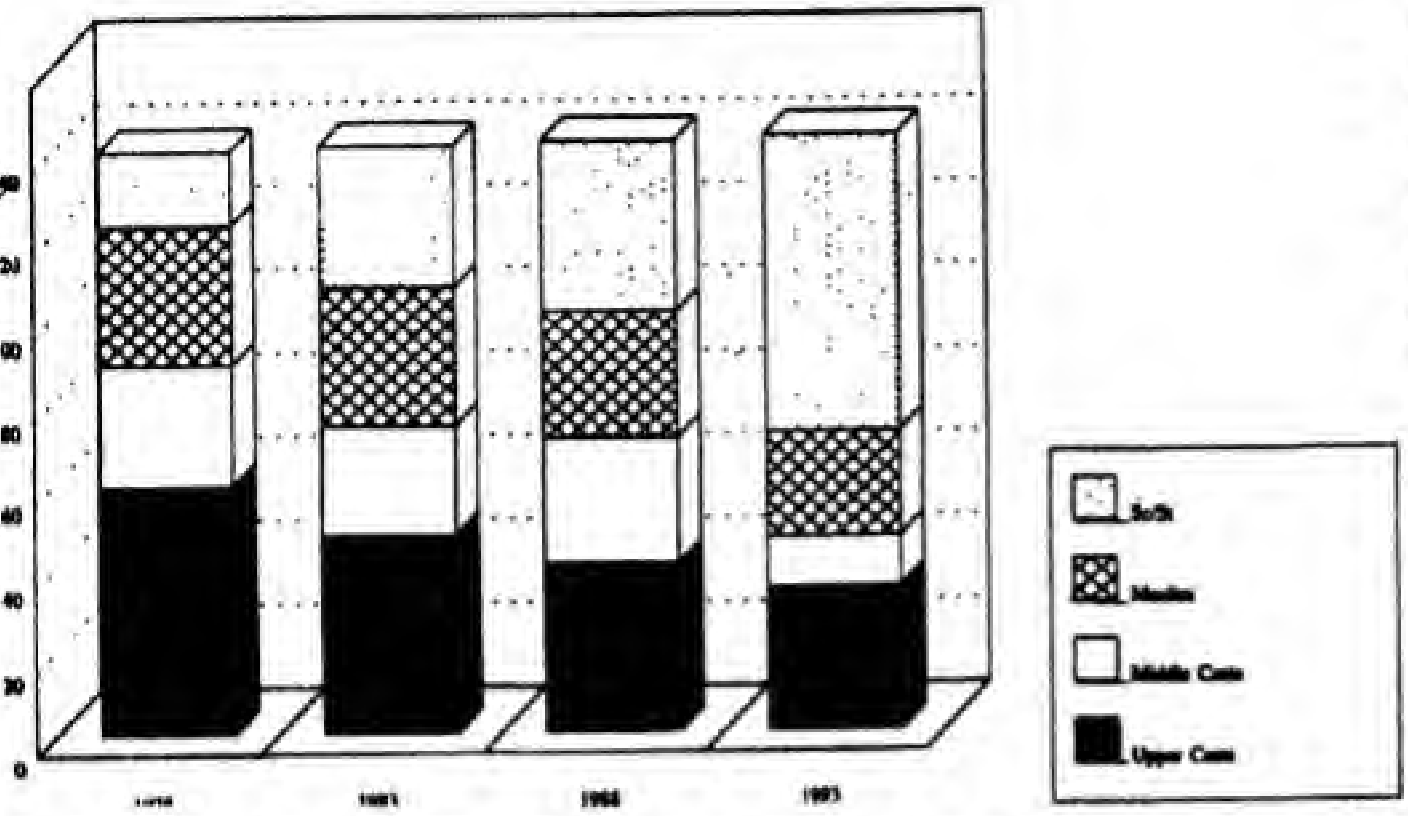
In the popularly elected village councils, as the graph on one block in Barddhaman district shows clearly, a more than proportionate number of the earlier marginalised castes and classes have taken their seats. The public space indeed has increasingly been occupied by poor peasants and agricultural labourers. Originally, it was argued that the low-caste and low-caste people had been kept out of the panchayat structure. Later it was argued that they had been elected in large numbers, but that the real power remained in the hands of the 'bhadrolok'. After the 1993 elections, this contention will have to be dropped.

It is indeed heartening to learn that the 1993 elections have furthered the process of progressively inducting more non-bhadrolok people into the panchayats. In my pre-1993 study on Memari II Block in Barddhaman, I concluded that the progress in the 1988 elections in comparison with the earlier elected bodies was 'remarkable': SC/ST presence in the panchayats was 30 per cent [Lieten 1992b]. I should have reserved my qualification 'remarkable' for the present panchayats: 51.1 per cent belong to SC/ST communities, well above their proportion in the population, and only 31.7 per cent hail from the so-called general Hindu castes.

Also, as another seesaw change, whereas previously women were virtually absent from the elected bodies, this time they represent 42.4 per cent, well above the statutory required minimum of one-third of the seats. The net consequence of this all is that in the block, male non-SC Hindus (forwards and backwards) have had their presence in the panchayats sliced to around 15 per cent.

It remains to be seen how the women will function. Newspapers have been generally pessimistic. On the eve of the elections, *The Statesman* (May 29, 1993:9) wrote that most of the candidates were village housewives, and that "They have grudgingly consented to be candidates for different parties under pressure of party leaders and the menfolk, who are more keen to use them as dummies."

Figure: Caste Composition of Panchayats
Memari, 1978-1993



Such viricentrist stories are common. They definitely reflect a male chauvinist bias. One may agree with the projection that women will not immediately start running the show, but in view of their mere numbers, the colour and the agenda of the panchayats is bound to change.

Till now, in terms of strategic power, the important functions all too often have remained with the male bhadrolok. This is neither surprising nor alarming for, after all, the process of passive as well as active enfranchisement takes time to develop. Moreover, many of the bhadrolok leaders have assumedly been declassed. But at the same time, their intellectual, cultural and managerial supremacy tends to prevent the lower class from rising. Especially in India, the phenomenon of the 'organic intellectual' is rare. The character of the public space has changed though and the question is whether the Left Front parties are consciously furthering this process.

The research findings do show that, by and large, the poor people in the villages feel that their power over village affairs has increased and that, partially because of the gram sabha, their knowledge of, and say in, rural development programmes has expanded. All too often, however, they still maintain that they are not learned enough to take part in the discussions and in management affairs [Webster 1992, Lieten 1992b, Ray and Mondal 1993].

Rural Development

The increasing visibility of women and hitherto marginalised subaltern castes is a commendable record in the political field. This feat had been pre-conditioned by a number of positive departures in the economic field.

The panchayats have channelled the state resources to the needy beneficiaries, and have prevented too much leakage towards non-target groups. The IRDP programme, for example, has generally found its way to the poorer sections of village society. Where it has not, the Left Front, and particularly the CPI(M) may have felt the reaction of an increasingly conscious and alert population in adverse election results.

The centrally initiated rural development programmes may have contributed to stimulate integrated development, but as C H Hanumantha Rao (1992) has rightly stressed in general terms, there exists a dichotomy, a lack of integration of special programmes with overall development. Even in West Bengal, the IRDP has rather lined the pockets of target group families, and has not substantially contributed as an instrument of rural development. One should add that the sub-optimal functioning is very much conditioned by the stringent guidelines laid down by New Delhi, and that lining the pockets of poorer people, rather than those of the powerful and wealthy, has definitely contributed to rural welfare.

The WB experiment nevertheless does show that rural development has taken place. Many indices may be used as references. (1) Out-migration from villages has virtually stopped. (2) Whereas in most Indian states, the percentage of rural non-workers between 1981 and 1991 has gone up, in WB it has come down. (3) Agrarian production between the mid-70s and the early 90s has virtually doubled, thereby neatly exceeding the all-India average. Output figures do suggest that during the Seventh Plan (1985-1990), West Bengal has come to occupy the first position among all the states in terms of growth of foodgrains production. Similarly, it occupies the first place in per capita increase in foodgrains consumption. (4) The process of polarisation and depeasantisation has been stopped. It is even possible that a process of repeasantisation has or had occurred. WB is the only state where the percentage of (male) agricultural labour in the workforce has declined between 1981 and 1991 [India: +2.35 per cent; W B:- 1.75 per cent]. (5) The process of polarisation and pauperisation also appears to have been reversed; poverty remains, but destitution is less apparent. Village studies confirm that agricultural labourers and poor peasants have fully profited from the improvement in agrarian production, although it should be added that this may vary between regions. The population below the poverty line has shrunk fast (to 27.7 per cent in 1991), but remains high in the neighbouring states of Orissa and Bihar (44.7 per cent and 40.8 per cent respectively).

Causal Factors

It remains to be seen whether the micro-variations between villages and blocks are caused by the differing quality and dedication of the panchayat leadership or by the more generally and ambivient environment. The data of my detailed village studies in any case may indicate the diametrically opposed picture of the spread of benefits in a commendable panchayat in Barddhaman, in a reasonably well functioning panchayat in Birbhum, and in a sick panchayat in the Contai region of Medinipur [Lieten 1992a, 1992b, 1993].

It also remains to be seen whether the positive departures can be traced to any of the initiatives which the Left Front government has taken from 1977 onwards: the panchayats, the land distribution and tenancy reforms, and the increasing financial allocation to agrarian inputs. It would be safe but too simplistic to suggest that the three ingredients have contributed their share. The crux of the matter may very well be that they are intrinsic elements of land reforms, at least if land reforms is comprehended comprehensively. Recently, John Harriss (1993) has dismissed the importance of land reforms, and has argued that the commendable performance of West Bengal is largely on account of its sound policy on minor irrigation facilities.

At stake seems to be a definitional problem: in essence land reforms/agrarian reforms include the whole gamut of intervention in the agrarian structure, both in the relations of production and in the forces of production as well as in the superstructural elements. The latter elements are not only 'thrown up' by the basis, but also function as the scaffolding structure, legitimising and/or coercing the social agents to accept the exploitative and basically undemocratic system. Mere land distribution then would certainly not deliver the goods. In addition, as a fleeting rejoinder to Harriss, we could add that the correlation land reforms/productivity increase is neither a linear one, nor a simple one. It is non-linear and multiple. Moreover, the irrigation argument does not

hold since the expenses on irrigation in the recent Five-Year Plans have been considerably higher (with a factor two to three) in Bihar, Orissa and Uttar Pradesh without effecting similar productivity increases.

Towards a New Intervention

The Left Front in 1977 has had a go at the rural political structure, relations of production and forces of production. The success has shown how important it is to intervene comprehensively and to continue to intervene comprehensively. After more than 15 years, and after four consecutive panchayat elections, one should ponder over the direction of that intervention. But one conclusion appears to impose itself as a road sign to success: the functioning of panchayats as people's democratic institution hinges on continuing mobilisation. It is probable that the panchayats which are doing well have generally experienced a drawn-out political battle, pitching poor peasants/agricultural labour against the landed elite. Barddhaman is the typical example to prove the case. Where mobilisation and agitation around class questions have been absent, as in post-independence alluvial Medinipur, panchayats have been less successful, floundering on the village 'key men' in a new reincarnation, clothed in a Marxist garb.

Personalised party politics, nepotism, and corruption tend to crop up if the mobilisation and constant check from below (or from outside) are not forthcoming. In a paper on some such panchayats, appropriately titled 'The pretender panchayats' [Lieten 1993], grass roots realities have turned out to be bleak and gloomy. In one block in Medinipur district (Ramnagar block), panchayats, rather than being a first step towards mobilisation for emancipation and enfranchisement, may as well have served as a dependence reinforcing structure. Rather than helping to wrest social power from the multidexterous dominant families, the new institution of delegated state power has rather helped to refurbish the class dominance of skilful and opportunist young males who have risen in status and power through access to economic opportunities offered by the rural development programmes. The vehicle of rural development, the panchayat, has been rendered rudderless and has lost its potential as a medium for mobilisation and conscientisation.

One important explanation for the deratlment is that the panchayats in Ramnagar have been tagged on to the prevailing social and economic matrix, and as such have virtually proved to be no-runners in the process of social renewal. Whatever social renewal has taken hold of the rural population, has apparently been more on account of 'the changing times' than of the functioning of the panchayats. This conclusion should be modified in the sense that enfranchisement and social renewal in Ramnagar are even less tangible in the Congress-dominated area than in the CPI(M) area. This suggests that, despite the low marks as compared to the credits of the comrades in other parts of Bengal, there still is a quantifiable difference between Congress and CPI(M).

The problems which have surfaced in the analysis of the panchayats in Ramnagar are many. They are not likely to be rectified at the local level. Neil Webster has been impressed by the "qualitative transformation in the material and political condition by a large section of the rural population previously missed, or ignored, by development programmes" [Webster 1992:124], but has also noticed a number of problems:

> These are problems that must be seen to lie in the continuing class character of agrarian relations in the villages and the political practice of the CPI(M) and Left Front government in the context of these class relations [Webster 1992:125].

This conclusion is in line with the lessons which we wish to draw from the studies in different districts. The panchayats will not do as a soft option. Class-based social movements, overhauling at least some of the economic pillars of the old class domination, are prerequisites for social and political change as well.

The struggle is a tedious one. It requires a constant checking from above and a movement from below. In addition to creating conditions for enfranchisement and mobilisation from below, it remains important that control from above puts a check on dysfunctioning and malfunctioning. The August 5, 1993 address by Jyoti Basu indicates that the (top leadership of the) CPI(M) is aware of the pitfalls associated with free wheeling local leaders.

In practice, action has often been taken against corrupt, inefficient and individualistic leaders. This has happened in the Ramanagar area, and although the CPI(M) lost the elections in the 'pretender panchayat', it goes to its credit that some of the corrupt elements had been taken out.

These and others are so many reasons to give high marks to the West Bengal panchayats and to the type of rural development. At the same time, one can be, and should be, critical of the many opportunities which have been missed and the lack of imaginative renewal.

A number of issues may be formulated, relating to interventions in different spheres and with different purposes. The purposes can be clubbed together under (1) efficiency, (2) development, and (3) social renewal.

Some of these issues have recently been discussed at a workshop of politicians, civil servants and academicians in Calcutta (see note). From the workshop, I have learned that most of the suggestions are already being addressed, and that some are even being implemented. From the address and the interventions by Asim Dasgupta, the minister of finance, I further learned that his government is seriously addressing the question of divisibility in the budget, which is basically the issue raised in A1 and A4 below and the generation of local savings and income (A3). From the concluding speech by Surya Kanto Mishra, the minister of panchayats and rural development, I learned that many lofty ideals and proposals cannot be put into practice: "I want to make it clear that devolution of power can be done to the extent that the state government possesses it. In India, there is only one government. The rest are local administrative bodies. The state government does not possess any state power, and therefore cannot decentralise state power and is circumscribed in the devolution of finances to the lower level"

Increasing the Efficiency

A1: An efficient system in the first place requires a planned and non-discretionary financial devolution. Financial allocations and disbursements remain hazardeous from Writers Building to ZP, from ZP to GP, and make any rational village planning and execution ephemeral. Hence local planning without financial autonomy has lost much of its meaning.

A2. Numerous improvements can be achieved without relying on the manna from the higher echelons. Local taxes can net considerable dividends. In addition the reliance on 'shramdan' and 'dhandan' will help to construct and reconstruct many local amenities, adding to improvement in the quality of life.

A3: Financial allocations require accounting. Numerous are the GPs which do not finalise their accounts and where accounts have not been audited. A cut in allocations, as is the practice in centre-administered programmes, will help to improve the financial soundness of the system, and will help to fulfil the targets. Such a punitive system, however, can only be instituted if the lower state levels are provided with technical staff, and, above all, have a guaranteed access to the financial allocations. The biggest defaulter in this respect remains the government of India.

A4: It has since long been agreed that the state departments (PWD, electricity, health, agricultural extension, education, etc), are inefficient, inert, over staffed and corruption-prone institutions. On the other hand, the local bodies would be interested in tackling the issues directly (both since they are directly effected and since the electorate expects them to act). A massive transfer of staff from the state to the local

structure is urgently called for. Social control on the way works are implemented will improve quality and speed, and will reduce corruption.

The budgets of the last couple of years have already introduced a number of changes, but the three-tier panchayat structure remains too much, as Mukarji and Bandopadhyay (1993: 9) call it, "horizontal interventions in a vertical jungle...At present, quite simply, the panchayats have the functions and the development departments the staff".

A5: Great stress should be put on work ethics, or, for that matter on managerial efficiency. Remoulding attitudes requires that the managerial apathy is confronted head on. The pressure to perform is very much present with top leaders and top bureaucrats, but the lower the level of administration, the more easy going and laid back attitudes predominate. Whereas the revenue-producers are hard-working men and women, the revenue-consumers (in the different levels of administration, education, etc) are still working at the pace of the 'mid-seventies', probably even of the mid-40s. Changing work ethics will be the biggest contribution to the exchequer, not unimportant in times of financial stringency.

Development Issues

B1: The land ceiling and vesting appear to be over. Although questions remain in regard of the zero benefit of the 1982 Amendment Act, panchayats can do useful work in starting up a co-operative movement. Till now, little attention has been paid to (production/marketing) co-operatives of small farmers/artisans. The Grameen Bank in Bangladesh clearly illustrates that co-operatives do not necessarily fail. If they fail (too) often in West Bengal, a profound study should have been undertaken. The trading middlemen appear to remain as important as before.

B2: Too many IRDP loans have been put to sub-optimal use. The leakage to non-target groups and corruption cuts have remained minimal, but at the same time, the individual loans have remained unintegrated in a local development plan. Panchayats should distribute the loans not as *de facto* consumption loans, but as loans integrated with local development projects, e g, co-operatives. The JRY fixation has restricted panchayat work to handed down formulae. As a consequence, interventions based on local resource endowments are largely missing. The decentralisation of the decision-making process, diluting the stringent conditions laid down by the federal government, could go a long way in stimulating local imagination and more effective use of the limited resources.

B3: Human capital is the basic ingredient in post-land reform development. The fixation on material assets' building, typical for IRDP/JRY obscures the fact that it is skilled human beings that matter. A comprehensive and widescale intervention in and supervision of educational and health institutions are basic pre-conditions for sustained growth. Panchayats should start playing a direct role in village education, and make sure that nobody is left out, that teaching does take place, and that the quality of teaching improves dramatically. The future possibilities of the state are tied-up with the quality of teaching generated now.

Social Renewal

C1: The adult literacy programme has been a novel type of intervention, a class intervention not directly related to the economics of class struggle. It has proved to have produced remarkable results in some areas in which the programme had been taken up just before the 1991 Census operations (for example 81.3 per cent literacy of +7 males and 56.6 per cent of +7 women in Medinipur), and makes the continuing situation in other areas (e g, 20 per cent female literacy in Jalpaiguri, West Dinajpur, and Purulia), even more unpalatable. This intervention requires a war-like effort, and should be combined with a forceful intervention in the way in which village schools are run.

C2: More broadly, the panchayats can play a more active role in introducing and improving a scientific temper. A significant drive has been going on in respect of some issues, e g, for secularism, but nothing short of a head-on mass social movement will help. Such a movement is urgently required in the struggle against the baneful dowry system.

C3: Social renewal involves a new place for women in society. In this respect, the panchayats could bring about the second revolution in the countryside. The new statutory provisions for women in the panchayats should serve as a launching path for the comprehensive emancipation of rural women.

C4: Panchayats can play an important role in the field of sports. Organising inter-village sports competitions (e g, volleyball, athletics) would go a long way in improving physical standards, interlink youth over the village border, and provide poor village boys and girls with healthy entertainment. It may not be a necessary ingredient of class struggle, it nevertheless is an element of class emancipation, and it may get Indian sports out of the unfathomable pith which it is in at the moment.

Decentralisation

Some of the many issues at stake have been indicated. They may not have the most direct relevance. Many more suggestions can come forward. All these suggestions need to be taken notice of, and it seems paramount that the relevant state institutions put their act together. A thinktank should come forward with ideas, pilot projects should implement these ideas and government and non-government evaluation/research teams should study the net results of such pilot projects and advise on further implementation.

In addition to the appropriate political perception, of which West Bengal seems to have sufficient, it all requires agility and managerial talents. In this respect some lessons may be learned from the private sector. Decentralisation in the thought ambit of the IMF/World Bank unfortunately remains focused on dececentralisation to the private sector. Decentralisation to public sector institutions may provide a good alternative.

[The article is based on a paper presented on August 23, 1993 at a workshop in Calcutta on Panchayats, Power and Development. The workshop, and the research underlying the ideas in the article, has been funded by the IDPAD (Indo-Dutch Programme on Alternatives in Development). The author wishes to thank Ratan Khasnabis, Ravi Srivastava, Mohit Bhattacharjee, Ajit Sengupta and Prabhat Dutta for useful discussions on points of agreement and disagreement.]

The New Panchsheela

B M

Narasimha Rao's inclination is to adopt policies which may yield short-term gains, and advance grandiose ideas in public that cannot be translated into practice.

THE ruling Congress party is making frantic efforts to celebrate three years of Rao government. The resources of the party directly and of the government indirectly have been mobilised in full measure for the purpose. It is a wholly partisan affair of the ruling coterie headed by the prime minister, P V Narasimha Rao, so much so that many factions and personalities even in the ruling party are bound to look upon it with reservations and misgivings. It actually signals a farewell finally and openly to its pretension of following the principle of consensus politics, which to the party has meant, right from the beginning, a *carte-blanche* for breaking the cherished national consensus based on values and objectives of the prolonged struggle of the Indian people for freedom, democracy, and socio-economic development on the basis of self-reliance and social equity.

The universal perception is that Narasimha Rao is not a charismatic personality. He is also widely believed to be prone to dithering, unwilling and unable to come to grips with the myriad problems of the masses. And yet he has survived and, many believe, has consolidated his position in the ruling party and as head of the union government. Those who have developed a special fondness for him believe that he is a stabilising force in an uncertain and volatile situation. They are willing to condone and even applaud political skulduggery and corruption of the ruling coterie headed by Rao because in spite of eroding mass support, he has turned out to be a hardly survivor who has lasted for three years in the prime minister's office and mans complete his 'term'. The TINA factor—'there is no alternative'—it appears, has a fascination of its own for many at present. Rao has taken advantage of this factor, cleverly and cynically, to bring about far-reaching changes in national policies and commitments which in the past, would have been rejected by the masses as well as all political parties and circles. The fact to be reckoned with indeed is that Narasimha Rao's role at the head of the central government is relevant only in terms of the decay of Indian polity in which a variety of vested interests among politicians, administrators, business interests and intelligentsia are finding opportunities to accept and even justify gross violations of all the principles of democratic accountability so long as their narrow self-interests are subserved.

Rao, as soon as he formed the government three years ago, embarked on a course which marked a total break with what were accepted national, economic, social, political and foreign policies. Far from seeking or promoting a new consensus, which he pretended to be working for, he opted for aggravating contentions in all matters and spheres of national concern. When he talked of consensus, it was only to ask for shoving under the carpet all contentious issues to smoothen the way for changes and adjustments in national policies to begin with, in economic policy matters, and subsequently on a wide-ranging, indeed all embracing, basis, including in respect to the character of the Indian state and the independent identity of India in the world order. It is not surprising either that secretiveness, deviousness and obfuscation rather than transparency and accountability to parliament and people, have characterised his functioning as the head of the government. He has revelled in negotiating deals with vested interests, domestic and foreign, personally and not through the properly constituted machinery of the state. The fact is also widely admitted that he has winked at growing corruption. His own personal integrity is not above question. The issue of illegal possession of hereditary land in contravention of the land ceiling law, in spite of matter going up to the Supreme Court, has not been clarified so far. He has not hesitated to arrange defections from opposition parties and even factional feuds within his own party to consolidate his position in the government and the ruling party. His penchant for running a highly centralised system of administration and party machine too is manifest.

Authoritarian Inclinations

There are instances and matters galore which demonstrate his authoritarian political inclinations. The latest is the sugar scandal and the dubious manner in which he has responded to it. He chose to announce in a hurry modifications in the telecom policy, opening the door for entry of multinational corporations in this sensitive sector in disregard of both economic and security considerations, on the eve of his visit to the US where wheeling and dealing with American business corporations was high on his agenda. His unconcern for parliamentary responsibilities and institutions is glaring. The handling of the JPC probe into the huge financial scam and avoidance of relevant and meaningful follow-up action on the JPC report and the more recent boisterous manner in which the Public Accounts Committee probe into sugar scandal has been attempted to be scuttled emphasise this disrespect for institutions' position. No less significant are his secret negotiations with the governments of the developed countries, in particular the US, Germany, UK and Japan, for bilateral treaties to guarantee security and high returns for foreign investment in addition to signing the GATT treaty and joining Multilateral Investment Guarantee Agency.

The economic reforms—so-called—of the Rao government have visibly emasculated the development role of the Indian state and its institutions. The mass of the deprived and exploited Indian people has been pushed out of the economic growth process. They have only to bear the full brunt of stagflation—high inflation and slow growth—even as big business in India, reluctant to make new investments, makes high profits from flogging existing productive capacities while foreign capital extracts special incentives and guarantees for any investment in the 'emerging market' in India. Totally facile, indeed deceptive, is Rao's frequent claim that in his scheme of things the government's financial resources can be released for social welfare such as education, health, agriculture and anti-poverty programmes.

The rationale of the so-called economic reforms programme of the government when it was launched in the middle of 1991 was said to be that it would dislodge vested interests which had grown and entrenched themselves in the Indian economy, society and polity during the failed experiment of planning socio-economic development. But it was suggested that in order to be able to break the resistance of the vested interests, the Indian market had to be opened up for benevolent external forces, economic and political, to play the leading role in the economic, social and political structures of India. The benevolent external forces which are being relied upon for this purpose are direct foreign investment. Multinational corporations, in particular, are being given a free hand, and are expected to shake-up a backward India, stuck in stagnation. This shaking up would admittedly hurt at least 600 million Indians, and the notion that the rest of the population would constitute in course of time a viable market of 300 million is facile and exaggerated. The fact is that

under conditions of stagflation the social base of the Indian market has tended to shrink rather than grow during the last three years under the present policy and political dispensation.

Rao's guiding principle is to postpone as far as possible, the day of reckoning. Populist-political considerations prevail in his posturing and policy preferences. Even the World Bank and IMF experts have expressed their doubts about the prospect of the Indian economy. They have warned against a flow of foreign capital to India when it is not augmenting investment for production purposes or creating real assets in the economy but is boosting speculation and inflationary pressures. Narasimha Rao's desperate search is for short-term political-populist gains rather than for sustainable growth and social equity in the long term. The new version of Panchsheel he has recently adumbrated is clearly lacking in conviction or credibility. It is the latest in a series of bright ideas, such as the middle path which he mentioned at Davos on the occasion of the annual meeting of multinational corporations. The fact is that principles have lost their appeal for Rao whose motivation is for opportunism in the management of political and public affairs and norms of governance. Seemingly strong in his own party and in relation to other political groupings, Rao is driven by the fond hope that he may, after all, complete what he claims to be his 'term' in the prime minister's office. But, meanwhile, incalculable harm has been and is being caused to the polity. It is no wonder either that corrupt administrators and oppressive organs of control and repression of popular masses, are acquiring overwhelming importance and power in the system of governance. A suggestion has been made that even if the Congress Party were to lose the coming general elections with an even larger margin than in 1991, Rao may manoeuvre to head a coalition government of some kind or other. Those who envisage, indeed make, such projections are obviously driven by their own rather queer idea of avoiding 'political instability'. They, for the same reason, may even suggest putting off general elections when they become due and depend on Rao to arrange the 'coup'.

The new definition of Panchsheel attempted by the self-styled philosopher-politician, Rao, grotesque though it may seem, is, therefore, full of many forebodings. Panchsheel was conceived 40 years ago as the assertion of the independent identity of countries which had broken the colonial shackles and embarked upon the re-generation of their societies and re-building of their economies by the mobilisation of their own resources, human and material. Its thrust was to guard against foreign interference in their internal affairs and not allow themselves to be embroiled in the cold war of rival military blocs. This was essential to prevent the reimposition of new forms of foreign domination over the developing countries and was a basis for their solidarity. Panchsheel as originally delineated is still very relevant and valid, particularly for India. The very idea of reinterpreting it is therefore wrong and perverse. It is inspired by the anxiety of the ruling coterie headed by Rao to hide the sinister moves underway during the last three years to 'open up' India to foreign interference and eventually, domination.

The so-called middle path, combined with the slogan 'back to the village' and the relationship between technology and tradition in the process of economic growth and modernisation of society which has been left undefined by Rao are 'principles' which are highly suspect. Rao's references to "a new world order" must at once recall the 'world order' which US president Bush proclaimed after the US military expedition against Iraq. Rao is evidently willing to fall in line. The concept of a new world order under US hegemony has been promoted by the US so that it can assume the right to intervene diplomatically and even militarily whenever it considers necessary, in 'trouble spots' in any part of the world. The Rao government would appear to be inclined to seek a role in this adventurous course. What is being projected really after all, is an unrelenting advance of the 'globalisation' process and the concomitant abridgement of the sovereignty of the nation states. Narasimha Rao at the head of the government in India has assiduously worked for the acceptance of this doctrine by India, to start with in respect of the Indian economy under pressure of an acute foreign exchange crisis and step-by-step the entire political, cultural, social relations in India. The progress in this direction in the last three years has, however, been patchy and fitful so far because of popular aversion and even active resistance from large segments of the population. But Rao is determined to push ahead on the path chosen by him and for him when he was catapulted to the office of prime minister three years ago.

Controlling Tobacco Use

Rajesh Kumar

A comprehensive long-term policy, giving due consideration to all sectors which will be affected, needs to be evolved.

TOBACCO abuse has assumed epidemic proportions in India. Population-based surveys have found that 70 per cent to 80 per cent of men and 15 per cent to 30 per cent of women use tobacco. The burden of diseases caused by tobacco is relatively small at present as compared to many other communicable diseases but considering the trend in tobacco consumption in last decades tobacco-related diseases such as heart attacks, asthmatic bronchitis, cancers of lung, lips, mouth, food and windpipe, etc, will increase in future.

Government action for tobacco control such as ban on promotion of tobacco through official mass media Akashvani and Doordarshan; printing of health warning on cigarette packs and on cigarette advertisements; prohibition on smoking in public transport; health information and education campaign; and tax increase on tobacco products have succeeded in reversing the trend to some extent but considering the enormity of this problem a comprehensive long-term policy is needed.

Tobacco is used in various forms: for smoking (cigarette, bidi, chutta, dhumi, chillum and hooka), for chewing alone or in betel-quid or in pan masala, mishri, and snuff. The per capita cigarette consumption has declined from 190 to 160 between 1970 and 1985 but only one-fifth of the total 120 million smokers buy cigarettes. The consumption index with base of 100 set in 1973-74 has reached only 111 for cigarettes by 1986-87 while in same period index for bidis reached 265 mark. The production figures for tobacco leaf show annual increase of 0.1 per cent. Total leaf production was 4,60,000 metric tonnes in 1987. Percentage consumption of leaf in 1982/83 was 34 per cent for cigarettes and smoking mixture for pipes and cigarette, bidis 26 per cent, chewing products 9 per cent, hookah 5 per cent, cigar and cheroot 2 per cent, snuff 1 per cent, and miscellaneous 26 per cent. Tobacco used in cigarette and bidis is of high tar content (range from 19.4 mg to 28.3 mg in cigarettes and 23.0 mg to 40.7 mg in bidis).

The consequences of tobacco use are well known for several decades in the west. Tobacco-caused diseases in the west are virtually all related to smoking whereas in India cigarette consumption is low. But all other forms of tobacco use have also been found harmful in Indian studies. Age-adjusted relative risk (of overall mortality) among smokers (mostly bidi smokers) was 1.5 and among chewers (mostly betel-quid chewers) was 1.3 in a cohort study of 10,287 individuals followed up for 10 years in a district of Kerala. A similar study on reverse chutta smoking in a district of Andhra Pradesh found relative risk of 1.9 in men as well as in women.

Rise in tobacco-related diseases will increase the economic burden on scarce resources of ministry of health. Social security costs of employees and workers covered by Central Government Health Services (CGHS) and Employees State Insurance Corporation (ESIC) will rise. Higher sickness rate and pre-mature death in smokers is not only a loss to productivity but to the productive workforce as well. Considerable part of income in poor smoker's household is consumed to buy bidis or cigarettes or khaini, etc, and consequently less money spending on food adds to pre-existing malnutrition problem. In addition to adverse effects on health, smoking habits are responsible for large numbers of fires in industrial establishments as well as in agricultural sector.

Tobacco farming uses many more pesticides and fertilisers as compared to other crops putting heavy pressure on farming land. The leaf of temburni plant which grows in wild is used in making bidis. Collection of this leaf from forest provides seasonal employment to hundreds of thousands of tribal people in central India but at the same time it is responsible for causing great strain on environment.

Most of the religious faiths in India prohibit smoking but some are more strict than others. Smoking in public places not only causes inconvenience to those who are not used to inhaling tobacco smoke but also hurts the religious sentiments of some people and at times leads to religious strife. In general people consider tobacco as social evil and many social organisation may take active part in anti-tobacco campaigns if the concept of public good is accepted in relation to tobacco use since smokers are a health hazard not only to themselves but also to non-smokers.

In view of the enormous adverse effects of tobacco use not only on health but also on economy, environment and social relations the tobacco control programme needs to be accelerated by adopting following measures. (a) Legislation: Ban all tobacco-related advertisements; Smoking in public transport and in specified public places be declared as an offence; Printing of statutory warning 'tobacco chewing and smoking is injurious to health' be made compulsory for every tobacco product including bidis; and Ban sale of tobacco products to minors. (b) Taxation: Increase tax on tobacco sale, higher tax on more harmful brands; and stop subsidies for tobacco farming. (c) Administrative: Set up a tobacco control authority to monitor implementation of tobacco control policy; (d) Education: Launch a multimedia campaign against tobacco to educate public about the harmful effects of tobacco.

Since tobacco production and consumption influences various sectors of society in several ways, some negatively and others positively; implementation of the policy should take into account its effects on various sectors. More than six million people are estimated to be employed in tobacco farming alone. Many thousand more are employed in manufacturing, distribution and advertisement of tobacco products. Sales promotion activities include even sponsorships of several cultural and sporting events. The state earns substantial amount (3.5 per cent) of its revenue from tobacco. Ministry of agriculture gives subsidies to tobacco growers. Tobacco control actions are likely to be opposed not only by tobacco growers and tobacco companies but also by some of the government departments.

Although most of tobacco-related activities, i e, production taxation, trade, etc, are controlled by other ministries and departments (ministry of agriculture, industry, commerce and finance) but ministry of health being custodian of peoples health and committed to the goal of 'health for all' should take the leading role for formulation of tobacco control policy and for monitoring its implementation. As a first step, therefore, the ministry should have its own working group on tobacco control. In order to generate consensus with other ministries on the policy of tobacco control a cabinet sub-committee should be constituted. Since the problem is very complex and involves so many sections of the society, implementation should be step by step in phased manner.

Replacement of tobacco farming to other cash crops is a difficult proposition since net returns per hectare are three times higher for tobacco as compared to other crops. Resources generated by increasing taxation can be used to give technological as well as financial assistance to farmers encouraging them to change cropping pattern away from tobacco. Similarly anti-tobacco media campaign be financed to re-employ professional advertisers in public and private sectors who are likely to become surplus due to the policy of ban on tobacco advertisement. Indian export market of tobacco products is on decline due to anti-smoking campaigns in the industrialised countries. Therefore, it is wise to give incentive to tobacco industry to shift over to other export-oriented consumer products. Revenue generated from tax increases on tobacco be invested in potentially profitable enterprises so as to compensate for the eventual decline and ultimate depletion of this source of revenue.

Tobacco control programme is essentially an enterprise of economic readjustment which I believe can be done without any financial loss to the country. All the gains in health can be attained without any extra cost. A comprehensive approach as outlined will reduce both demand and supply by anti-tobacco campaigns and by tax increases and rapid decline in tobacco abuse will be achieved.

Centralised Decentralisation

Haryana Panchayati Raj Act, 1994

Mahi Pal

In order to make the panchayats institutions of self-government, the leadership at the grass roots level has to be strengthened. This cannot happen when panchayat acts, as in Haryana, accord a major role to the centralised bureaucracy.

HARYANA had a system of local self-government in the pre-British days—bhaichara panchayats (i e, community council). However, it had no popular base. Till 1939, some steps were taken towards decentralisation mainly for discharging judicial functions. In 1952, the Punjab Gram Panchayat Act was enacted to further democratise the local institutions. However, there was very little progress in practice. The Panchayati Raj system was ushered in 1961 after an amendment of the Gram Panchayats Act. Along with it the Punjab Panchayat Samiti and Zilla Parishad Act was also passed, which adopted the Balwantrai Mehta model of decentralised structure. After the creation of Haryana as a separate state in 1966 there followed a period of about 25 years in which these institutions remained virtually on paper only. In fact, in 1973 one of the pillars of the grass roots level democracy, i e, zilla parishad was abolished. The main factors responsible for their dismal performance have been the unfriendly attitude of the state level political leaders and officials and the unequal distribution of land and assets.

Gram Sabha

Gram sabha (GS) has been made the cornerstone of the panchayati raj system. It is (Section 11(1)) mandatory to hold at least two GS meetings in a year. One between May 1 and June 30 and second between November 1 and December 31. If the sarpanch (i e, chairperson of gram panchayat) failed to hold these general meetings on the dates, he shall automatically cease to hold office from the date on which the second meeting was to be held (Section 11(2)). The quorum of the GS meeting is fixed at one-tenth of the total number of its members. It is also compulsory for the block development and panchayat officer and the gram sachiv (village secretary) of the gram panchayat (GP) to attend every general meeting of the GS. The GP may call village-level functionaries serving in the Sabha area to attend the meetings and give advice in respect of any matter.

A number of powers and functions (Section 12) such as to consider the budget, future development plan, programmes audit reports, review the general progress of the development plan, consider the actual income and expenditure of the GP, scrutinise the existing schemes as well as completed works, maintain a complete register for all development works undertaken by the GP or by any other government department have been entrusted to GS.

The powers and functions endowed to the GS may make it a strong corporate body to plan, execute and monitor the development and social justice plan of the GP.

Provisions of Acts

Gram Panchayat (GP) shall consist of sarpanch, upsarpanch (vice-chairperson) and six to 20 panches (members) elected from the different wards depending on the size of the panchayat. The sarpanch shall be elected directly while the upsarpanch shall be elected indirectly. The seats for SC/STs may be allotted to those wards having maximum population of these castes. A seat of panch is also reserved for backward classes in GP provided backward classes population is 2 per cent or more to the total population of the panchayat which will be filled from the ward having maximum population of this group.

A sarpanch may be removed from his office by a majority of not less than two-thirds votes of the members of GS present in the meeting convened by the authority. It is also mentioned that the attendance in such meeting shall not be less than 50 per cent of its members. This type of meetings can only be held if majority of not less than one half of the panches request for such meetings. The meetings of the GP (Section 13(1)) shall be held once in two months. The meetings shall also be open to the public.

Every GP or group of GPs shall be assisted by a secretary who will be the state government employee. Each GP (Section 22(1)) shall constitute various sub-committees including social justice committee. If a GP consists of more than one village, then it will have a local committee comprising of a panch of the village concerned and appointed members from among GS members. At least one member belonging to SC shall be on the social justice committee. Every GP shall have a gram fund for carrying out the duties and obligations entrusted to it.

The panchayat samiti (PS) shall comprise three types of members: (a) directly elected member from the territorial constituencies, (b) members of the legislative assembly whose constituencies form a part of the PS area, and (c) one-fifth of the total sarpanches within the jurisdiction of the PS. This lot will be rotated every year so that within 5 years all sarpanches are represented in it. The b and c types of members shall be *ex officio* members. MPs will not be members of the PS. MLAs enjoy voting power only in the decision-making of the PS. The samiti shall consist of 10 to 30 members. Each member will represent 4,000 population in those PSs whose population is up to 40,000 and 5,000 population in those PSs where population is more than 40,000. One seat is reserved for the person belonging to backward classes.

The power and function of chairperson among others are to convene, to preside and to conduct the meeting of the samiti, discharge all duties and powers conferred on him under this act. The chairperson or vice-chairperson can only be outed if a resolution to this effect is passed by not less than two-thirds of the total elected members. The meeting of PS shall generally be held once in two months.

The PS shall also constitute (section 18) various committees including social justice committee. The executive officer of the PS shall act as secretary of every committee. PS can impose two types of taxes. One with the prior permission of the chief executive officer (CEO) of zilla parishad and second without permission. Each PS will have a samiti fund. The supervision of the PS (sections 106 to 116) shall be done by both the CEO of ZP and the state government.

The zilla parishad (ZP) shall comprise three types of members. (a) Members directly elected from their constituencies in the district, (b) the members of house of people whose constituencies lie partly or wholly within the district, and (c) chairperson of all PSs of the district. The members of the house of people and chairperson of samitis shall be *ex officio* members. They shall have right to vote in the meetings of the ZP except for election and removal of the chairperson and vice-chairperson of the ZP. The total directly elected members can be between 10 and 30. Each member of the ZP shall represent 40,000 population. One seat of ZP is reserved for backward classes. The elected members of this body shall be two-thirds or more of the total members of the ZP. MLAs are not of members of this body.

The power and functions (section 122) of the chairperson *inter alia* are to convene to preside and to conduct the meetings of ZP, discharge duties and powers entrusted to him. ZP shall be a advisory body (section 137). The ZP may also constitute the committees. But what type of committees shall be constituted is not specified. Every ZP shall have a zilla parishad fund (section 145).

The chairperson of ZP (section 123) can only be removed if the removal resolution is supported by the two-thirds of the total directly elected members. Such type of meetings cannot be convened before the expiry of one year from the date of election of the chairperson. Meetings of the ZP shall be held ordinarily once in two months.

The staff of the ZP shall be like this. The additional deputy commissioner (section 133) shall be the chief executive officer of ZP. Every ZP will also have deputy chief executive officer-cum-secretary who will be amongst the district development and panchayat officers. Besides, government may also appoint accounts officer and one or more assistant accounts officer as may be required by the ZP. In addition to that, if government thinks appropriate it may put other officers or officials employed by the district rural development agency under ZP.

Section 175 (q) has the provision of disqualifying for election of panchayat at different levels, a person having more than two children after one year of the date of commencement of this act. The constitution of state election commission (section (212)) finance commission (section 213) and district planning committee (section 214) are also other main features of the act.

Some Comments

The provision of holding at least two meetings of GS in a year (section 11 (1)) and in case the sarpanch fails to hold these two meetings, he shall automatically cease to hold office from the date on which the second meeting was to be held was already in the previous gram panchayat act 1952. The experiences gained so far tell that these provisions have not been implemented. Singh's study (1985) of Bhiwani district about the functioning of panchayat raj institution shows that the meetings of GS never held as specified. The powers this body enjoyed were never exercised by it. Sarpanch never automatically ceased to function if he failed to call obligatory meetings of the sabha. The budget of the panchayat was never rejected by it. People have no attraction for these meetings even if they are held. The factors responsible for such a dismal performance of this body have been among others, lack of awareness among the members of the sabha about the statutory existence of this as an institution, personality clashes, functionalism, groupism, communalism, illiteracy, negative attitude of the influential leaders. Singh (1978) and Chaudary (1978) also came to the same conclusions about the performance of this corporate body.

A close look at the powers and functions of GS (section (12)) reveals that it will revise the budget or direct to reconsider audit reports or revise the progress reports prepared/submitted by the GP. But it is not compulsory on the part of the GP to follow GS's directions. Further section 12 (iv) says that GS "shall maintain a complete register for all development works undertaken or any other government department specifying, the costs, date of completion of work and name of assets, etc". But the act does not provide a mechanism for the GS to maintain these detailed information. It would be better if the provision such as formation of vigilance committees and monitoring committees had been made in the act of oversee the functions of the GP. The Bihar Panchayat Act 1993 has this provision.

As per government of India publication: Panchayati Raj Institution of India (1991): the average population of GP in Haryana, is 1,744 which is far below the viable population (about 5,000) of GP as literature on viability of panchayat reveals. Keeping in view the viability of panchayat and Bihar Panchayat Act and Karnataka Panchayat Act have made the provision of constituting a GP for a population of 5,000 to 7,000.

The act has provision of forming various committees at GP (section 22), PS (section 83) and ZP levels (section 139). But, it would be better if these committees would be a representative body. In other words, the representation of the SCs/STs and women among these committees shall be in proportion to their population.

Bureaucratic Control

Going through the chapters conduct of business, duties, functions and powers, finance and taxation and control one finds several sections which empower either bureaucracy or government and therefore undermine the role of GP, PS and ZP. A few examples are given: (i) As per section 27 if any person disobey the order of the GP, he shall be punished to the extent of Rs 1,000. But the following (section 28) has the provision that any aggrieved person may, within a period of 30 days of such order, appeal to director whose "decision shall be final and shall not be liable to question in any court of law". It means that whatever is given to GP under section 27 has been taken by the bureaucracy through section 28. To keep organic link among three tiers of panchayat provision would have been that aggrieved person might appeal to PS. The section 29 (1) is even more harmful to panchayat. In case any complaint against the peon, constable, chokidar, patrol of irrigation department, forest guard, patwari, etc, are made to GP, the GP may only enquire into the matter and submit the report to either the superior officer under whom he works or to the CEO of ZP. And these officers may further enquire into the matter if required, take suitable action and inform GP accordingly. To add further "provided that nothing in this section shall be construed as empowering the gram panchayat to summon any official or to exercise control or to take disciplinary action against such official or otherwise". (ii) In case of PS also, chairperson has no control over its executive officer except securing implementation of resolutions. In similar way, the chairperson of ZP (section 122 (v)) also has a "administrative supervision of the CEO for securing implementation of resolutions or decisions of Zilla Parishad or any committee thereof". This type of vertical control of bureaucracy is against the letter and spirit of the decentralisation. The real devolution can only be realised when each tier of panchayati raj shall have their own bureaucracy. The state should learn a lesson from the Gujarat Panchayat Act in which provision for panchayat service cadre is made.

(iii) About the powers to suspend GP, the section 47(1) says that the real power rests with bureaucrats "the district development and panchayat officer or divisional officer (civil) as the case may be by written order, suspend the executive of any resolution or order of the GP prohibit the doing of any act which is about to be done or is being done under the provision of this act. However, in special circumstances if in the opinion of the director the gram panchayat has committed gross negligence to perform its duties and functions, the director in *suo motu* or on complaint or report of the district development and panchayat officer or subdivisional officer (civil) as the case may be received in this behalf and after giving reasonable opportunity to explain the gram panchayat concerned may take necessary action and such order as he may deem fit". If someone (section 54) tampers with the GP property panchayat can punish him up to 500 rupees and recover the damage. If an aggrieved person within 30 days appeal to director, his order will be final.

The section 64 (i) in case of PS and (section 160) in case of ZP have empowered both director panchayat and government to suspend chairpersons or vice-chairpersons or members if any criminal offence is established against them. This provision does not provide an organic link among these three tiers of the governance. The

organic link can only be maintained if state controls ZP, ZP controls PS and PS controls GP.

The cardinal principle (i e, what can be done at a given level should be done at that level alone and not at the higher level) for distribution of function powers among the different tiers of panchayats has not been followed in the act. For instance, under education, primary and secondary education shall be handled by both GP and PS. Similarly promotion of rural cottage industry shall also be handled by GP and PS. The best way of this might be the primary school should be managed and supervised by the GP and secondary education by the PS. For rural and cottage industries implementation should be done at GP level and promotion of these industries at PS level.

The act has provision of forming gram fund (section 30), samiti fund (section 98), zilla parishad fund (section 145). But the size of this fund depends on the mercy of the both bureaucracy and the government. These institutions do not have clear power of imposition of taxes. Any decision in this regard has to be approved/sanctioned by the government. As per section 41 (1) "GP on behalf of the government can only impose certain taxes if it has the approval of the director".

In PS, as per section 90 (6) (7) the CEO may refuse to sanction or return to the panchayat samiti any proposal about finance and taxation. Again under heading levy/fees (section 9 (1)), a PS may impose certain levy but with the prior sanction of the CEO and "subject to the general direction and control by the government". One item of samiti fund is the proceeds of all sources of income which the government may order to be placed at the disposal of PS. But this is followed by "the government may revoke any order made under this clause".

All these examples clearly show the dependency of PS either on CEO or on government. It may be appropriate to mention that in 1970-71, the state government had abolished the professional tax which was one of the main sources of PS. Secondly, the management and governance of the cattle fair were also taken over by the state government from the PS. These examples clearly show if the PSs falls in the line into the government at the state, they may be given some liberty to raise resources, otherwise not.

In case of ZP also real power of imposition taxes, cess, etc, rest with the government. The supervision of the SP will be done by the state government or director panchayat. For instance section 107 says that the government shall advise, supervise and co-ordinate the function of the panchayat samitis. When government performs this what role the ZP will play. Further, section 108 says that the government may cancel any resolution passed by PS or its committee if in the opinion of the state, it is illegal and not in public interest. What is public interest is not mentioned/defined anywhere in the act. Chances are that the state government may use this clause for political ends.

The plight of the ZP is even worse than the other two bodies. The functions of this body are not clearly defined. For instance, under duties and functions of ZP the section 137 says that the ZP shall advise, supervise and co-ordinate the functions of panchayat samiti of the district. Under the supervision chapter of PS the section 107 says that the "Government shall advise, supervise and co-ordinate the function of the panchayat samitis. It means government advise, supervise, and co-ordinate the all PSs of the state while the ZP shall advise, supervise and co-ordinate the PSs of the district. It is against the cardinal principle and more than this, it will create confusion among the PSs/ZPs. Principally, it should be like this, ZP should advise, supervise and co-ordinate the PSs and government should advise, supervise and co-ordinate ZPs. All this clearly shows that government and bureaucracy want to put their hands everywhere.

The District Rural Development Agency (DRDA) still remains a separate identity (section 133 (4)). This will be parallel to ZP. In the light of 73rd Constitution Amendment the DRDA is redundant because the functions, this body used to perform, has been devolved to panchayats as per schedule 11. And now at least ZP shall be constituted at district level invariably and if it is dissolved, election shall also be held invariably within six months. Hence the rationale of existence of the DRDA is not convincing.

The section 175 (q) has the provision that any person having more than two children shall be disqualified for election. Not only this, even after getting elected if one has third child, he would lose seat. The rationale behind this is, to popularise the family planning programmes. This provision is entirely unjustified. Why did the state government not impose this condition for MLAs' election Charity begin at home. The implication of the clause may be that it may prevent a number of dedicated and experienced persons from becoming panchayat leaders.

Section 214 of the act has made a mention about the District Planning Committee which shall be constituted as per the provision of Article 243 ZD constitution. But who will chair this committee is not mentioned. This is very important because this body will be the final authority at district level to decide the size and content of the district development plan comprising both rural and urban areas of the district.

The judicial functions enjoyed so far by the GP are no more with this body. As they have not been made part of the act. This is a sheer example of disempowering the GP through latest panchayat act. The judicial functions should have been part of the legislation because it is desirable to give speedy and economical justice to local peoples by their own people. Moreover, it has become more important in the present situation in which the judiciary is not expanding.

It is clear that state level political leaders and bureaucracy have a major role to play in the functioning of the panchayati raj system in the state. This is due to lack of political will on the part of the state level leaders to transfer power to the people. The past experiences show that in place of people's raj deputy commissioners' raj prevailed in the state. The latest Panchayat Raj Act also has a number of provisions giving control of panchayats to the bureaucracy and the state government. Therefore in order to make panchayats institution of self-government and meaningful institutions for enlisting people's participation, the leadership at the grass roots level has to be strengthened. One possible way to achieve this goal is to reduce economic inequality in the distribution of land and assets in the rural economy of Haryana. The reservation for weaker sections can only be effective if land and assets are given to them. The experiences of Haryana so far reveal that even though in some panchayats SCs had cornered sarpanchship, the real power of sarpanchship has remained in the hands of dominant castes. The examples of West Bengal and Kerala are well known where land reforms provided strong leadership at the grass roots levels.

Jawahar Rozgar Yojana: An Assessment in UP

Kripa Shankar

A survey in the villages of Uttar Pradesh indicates that the Jawahar Rozgar Yojana has not only failed to generate adequate employment, but has not been able to bypass the local bureaucracy, as it was intended to do.

JAWAHAR Rozgar Yojana (JRY) was started in 1989 by merging National Rural Employment Programme and Rural Landless Employment Guarantee Programme with the primary objective of generation of additional gainful employment to the rural underemployed and unemployed. The novel feature of the scheme is that funds will be released directly to the village panchayat which will execute employment programmes according to the felt needs of the people. Village panchayats were thus provided substantial funds for the first time in their history to undertake employment generating works bypassing the bureaucracy in the shape of block officials. This was an improvement over earlier employment generating programmes which were solely executed by block officials with no involvement or control of the village people and consequently the results were obviously unsatisfactory. This devolution of power and funds was a bold step in the given situation and the experiment is naturally being watched keenly.

The manual for JRY issued by government of India has envisaged very comprehensive measures to ensure that the people of the village as a whole are associated at each and every stage of the execution of JRY and they exercise full control over it so that the programme may genuinely become a people's programme bringing in new dynamism to rural generation. Section 29.1 of the manual enjoins that "The Plans for development of village panchayats/mandals should be discussed thoroughly in the meeting of the village panchayats." Section 32.1 provides that "The village panchayat should appoint a committee for each village under its jurisdiction to oversee, supervise and monitor the implementation of the works under the programme." The manual is very particular about social control over the whole scheme. Section 38.1 provides that "In order to ensure social control of the Yojana, meeting of village panchayat should be held every month, a fixed date, time and place to consider the issues regarding the planning, execution, monitoring and supervision of JRY. These meetings shall be open to any member of the village community, who shall be free to raise any issue regarding the implementation of the Yojana. The village assembly to be held at least twice a year should also be kept informed about the progress of implementation of JRY and all the related issues."

It also enjoins that officers at the district and block level must closely monitor all aspects of the programme through visits to the work sites in a regular manner, and provides an illustrative list of works to be taken up under JRY. The first item in the list is social forestry works followed by soil and water conservation works, water harvesting structures, minor irrigation works, drains and field channels, construction and renovation of village tanks, construction of houses for scheduled caste and scheduled tribes, construction of rural roads, land development and reclamation of rural waste land and so on. But unfortunately, there is no specific directive for sectoral earmarking of the resources except that 15 per cent of the annual allocation must be spent on items of works which directly benefit SC and ST. The result has been that the pradhans are free to spend funds in a manner which they find most attractive more so when there is no discussion of the action plan at the village level and there is no social control over it.

Methodology

By and large, pradhans have been elected through muscle and money power and any effort to know about the JRY is beset with difficulties. An outside investigator may not succeed in getting reliable information particularly when the work has already been completed. It was consequently decided to have resident investigators.

Among the investigators who had worked with us in the past, four hail from different blocks of Fatehpur and Allahabad districts of UP. They were selected to investigate about the JRY in their own nyaya panchayats. The latter has generally 7-10 villages in its jurisdiction. Thus the universe consisted of 39 village panchayats spread over five blocks one out of which was a DPAP block lying in the Vindhya range while the remaining four blocks were in the plain portion.

The labourers who had worked in the JRY were our main source of information although they too could not give accurate information regarding mandays of work or the materials used. We cross-checked the information with as many labourers as we could contact in each village. A minimum of 10 such labourers were contacted in each village and on the basis of information provided by them and by visiting the work-site we made our assessment of the material used and mandays of work generated. We had instructed the investigators to be liberal in assessing the works as time lag might induce underestimation. It should be admitted that it was not a very satisfactory exercise but no better course was available. There is a high element of subjectivity and our estimates of mandays and material used should therefore, be taken with a pinch of salt. Records in the blocks were scrutinised to get at the official figures of mandays and materials used in the sample village panchayats. Knowledgeable persons in the villages were also interviewed to obtain their perception about JRY.

The reference period is 1991-92. We also called on the secretary, department of rural development, government of India to know why the instructions in the manual of JRY that the account would be operated jointly by the pradhan and another person elected for the purpose who must be a member of the village panchayat, is being flouted in UP, where invariably the block functionary known as gram panchayat adhikari (GPA) jointly operates the account. The secretary promised to intervene.

Findings

Table 1 shows the expenditure on material and wages as per records at the block along with our own estimates for both.

It will be seen that our estimated expenditure on material was 63 per cent of what was shown in the records and the same in case of wages was 52 per cent for all the sample panchayats. Thus roughly 60 per cent of the funds can be said to have been actually used and the remaining 40 per cent represents the magnitude of leakage. It will also be seen that in DPAP Manda block lying in the Vindhya range and having lowest agricultural productivity and literacy rate, the leakage according to our estimate was as high as two-thirds of the total funds.

It may also be observed that the directive that 60 per cent of the total funds should be utilised towards wage payment and only 40 per cent should go to expenditure on material has nowhere been observed. According to records 67 per cent of the expenditure was towards purchase of materials and only 33 per cent had gone for wage payment. Our estimates for wage component is still lower at 29 per cent. The much higher percentage expenditure on material is to be largely explained by two factors. One, in all the panchayats soling, i e, laying of bricks in the lanes and by-lanes and other pathways constituted the single most important activity accounting for more than 50 per cent of the total expenditure. It

was not possible to maintain the 60 per cent wage norm in this activity as expenditure on bricks for soling accounted for more than two-thirds of the total expenditure on this activity. Again the scope of leakage is much larger in the purchase of material. Inferior material can be purchased and inflated bills can be easily procured.

Table 2 shows the percentage distribution of expenditure on various activities in the different blocks. It will be seen that expenditure on soling accounted for 54 per cent of the total expenditure for all the blocks taken together. Housing for weaker sections under Indira Awas Yojana (IAY) was the next item of importance as it accounted for 14 per cent of the total expenditure. Construction of link roads involving only earthwork where the entire expenditure is on wages accounted for 11 per cent of the total expenditure. Chak roads accounted for another 5 per cent. It is worth noting that an activity like link and chak roads which did not entail any expenditure on material as such and consequently benefited the labourers most did not find much favour with the pradhans as it accounted for one-sixth of the total expenditure. Repair and renovation of drinking water wells accounted for only 4 per cent of the total expenditure. In the drought-prone hill block of Manda which suffers from acute drinking water, scarcity in summer season its share was no higher than 5 per cent.

In view of the importance of providing irrigation through open dug wells to SC and ST farmers the government has earmarked 20 per cent of the JRY funds to the million well scheme (MWS) started since 1988-89. But despite this provision we did not come across irrigation wells under this scheme meant for SC and ST population. Tank excavation also accounted for only 1 per cent of the total expenditure and was confined to only one block although tanks and ponds requiring excavation and renovation were to be found in almost all surveyed panchayats.

Construction of small water harvesting structure is vital to conserve rain-water and soil. It has been estimated that 12,000 million tonnes of top fertile soil is washed away every year due to torrential rains in the country. Conservation of rain-water is all the more important in drought-prone hilly areas where ground water cannot be easily exploited. Even in plain portion conservation of rain-water has assumed added importance due to falling water table. It is a glaring failure of the JRY that funds were not at all utilised towards conservation of rain-water in any of the surveyed panchayats.

Table 3 shows the percentage distribution of total expenditure on wages in various activities. It will be seen that construction of link roads accounted for 42 per cent of the total wages paid. Soling accounted for 31 per cent of the total wages followed by chak roads (12.5 per cent). It will thus be seen that road construction accounted for 85 per cent of the wages paid. Repair of walls and plantation accounted for nearly 3 per cent each on wages while tank renovation and construction of houses accounted for 2 per cent each. The share of other activities was 1 per cent or less than that.

Despite the importance assigned to social forestry in the scheme of things less than 3 per cent of the expenditure was incurred on social forestry. Out of 39 panchayats, expenditure on this item was incurred only in nine panchayats and the total expenditure was only Rs 23,453. No systematic plantation of trees was undertaken in any village. Some saplings were planted here and there mostly on the embankment of ponds and on road sides but in our survey we did not find a single tree surviving. Nothing was done to protect the saplings and soon after the plantation they were eaten up by goats and other animals. It appears that if social forestry is to be put on a sound footing more importance is to be given to protecting the plants than mere planting them.

The JRY manual has rightly emphasised the scheme of 'tree pattas' for the poor under which they can plant trees and maintain them on lands which may not belong to them but are entitled to the usufruct of the trees. In that case the maintenance of trees is the responsibility of the tree patta holder who can also be assisted for maintenance of the trees from JRY funds up to three years. It is an improvement over the general programme of social forestry as it will specifically help the poorest. But again, in none of the panchayats was the programme of 'tree patta' initiated. Barring four cases, no pradhan had any idea of the scheme. The rural poor too were unaware of it and when we talked to them about the scheme they felt that it can really do good to the poor in howsoever small a measure on a sustained basis.

Table 4 shows the distribution of workers, mandays of employment and income from JRY in the different blocks.

It will be seen that according to records average employment per worker under JRY ranged from 19 days in Phulpur block to 58 days in Sirathu; the average for all the blocks being 31 days. As per our estimate, the average mandays of employment for all the block was 16.[1] Average income from JRY was Rs 561 according to records and Rs 293 according to our estimate for the entire sample. JRY thus cannot be said to have provided enough employment or income to the labouring households.

We had randomly selected five JRY workers from each panchayat and noted down their entire income from all sources. The JRY income as percentage of their total income was only 9 per cent for the entire sample.

Table 1: Expenditure on Material and Wages

Block	Expenditure on Material as Per Record	Expenditure on Material as Per Our Estimate	3 as Per Cent of 2	Expenditure on Wages as Per Record	Expenditure on Wages as Per Our Estimate	Estimated Expenditure as Percentage of Recorded Expenditure
1	2	3	4	5	6	7
Airawan	3,78,018	2,70,000	71.43	1,30,752	39 36	63.16

Out of the total workers who found work in JRY 3 per cent were skilled workers and the remaining were unskilled. Woman workers constituted only 6.8 per cent among the unskilled workers. They overwhelmingly belonged to SC and ST castes although women for upper caste and middle caste also worked in the JRY. Of the labourer households in the sample villages 52 per cent had found work in JRY although the average number of days for which they found work, as reported earlier, was only 16 days. The cost of creating one manday of employment was Rs 55 for the entire sample on the basis of recorded expenditure and the cost of creating employment for one person was Rs 1,712 on the same basis and Rs 1,024 on the basis of estimated expenditure.

In view of the leakages and absence of any social control the quality of the assets created, by and large, was not up to the mark except in some exceptional cases.

Maintenance of Assets

While the JRY manual mentions that "The village panchayat is permitted to spend up to a maximum of 10 per cent on maintenance of the public asset created the JRY village manual takes a contradictory position to the effect that such assets "should be handed over to a regular department of state government who should be responsible for their maintenance. It is only in rare cases when the assets have not been taken over by a regular department, that village panchayat should spend funds out of the Yojana for the maintenance of assets" (p 15). However, the pradhans complained that no funds were provided for maintenance and as such they could do nothing about it. No pradhan was aware of the JRY manual which permits 10 per cent of the amount towards maintenance.

Out of 39 pradhans in the surveyed villages, 10 were high caste Hindus, 19 belonged to backward castes, eight were Muslims while one each belonged to scheduled caste and scheduled tribe. One was illiterate, two were literate, 13 had read upto primary stage, 10 had passed junior high school, seven had passed high school, one had read up to the intermediate level while five were graduates. As regards their assets, 41 per cent were in the asset category of Rs 2-5 lakh and another 36 per cent had assets of over Rs 5 lakh. Thus more than three-fourths of the pradhans had assets of more than Rs 5 lakh. There were only two pradhans who had assets of less than Rs 50,000 each. Occupationwise 31 were agriculturists, three were teachers, two were shopkeepers, two were contractors and one was a public worker.

We tried to gather some information regarding assets that had been acquired by the pradhans during the last three years. It was difficult to get accurate information on this sensitive issue. But five pradhans had purchased tractors, two had purchased jeeps, one had purchased a mini bus, eight had purchased motorcycles/scooters and eight had constructed or renovated their houses in an impressive manner. There were reports that a few had purchased land and building and invested in trade and business but no authentic information on these could be gathered. Incidentally the pradhans in the backward Manda block were foremost in acquiring the abovementioned assets.

Suggestions for Improvement

One very serious lacuna about the whole scheme that we could discern during the fieldwork was that in no village was anyone aware of the amount of JRY funds that had been sanctioned or released to a panchayat. All the schemes for social control and popular involvement lose any meaning if the people do not know anything about the amount of the funds received by the panchayat. Only if the people know about the funds received can they question the pradhan regarding the works being executed under JRY. The pradhan can well say that very little funds were given and he utilised them fully. On the other hand if people are aware about the quantum of grants received they can question the pradhan if the work done is inadequate in relation to the funds received. As a matter of fact the pradhan will himself not dare to grossly misutilise the funds if he knows that people are aware about it and his reputation will be at stake.

No doubt the JRY manual for the village issued by ministry of rural development stipulates that "Village panchayat should choose one prominent wall in each of the villages under its jurisdiction which will be used to display the essential information in respect of JRY, like the allocation received during the year, the item of works which have been chosen by the village panchayat for execution during the year...". But in our survey we found that in none of the villages was any information displayed and no one in the village including members of the panchayat knew anything about the funds received. By and large, members felt that it was the sole prerogative of the pradhan and hence they did not bother about it. Even at the block no such notice about the funds distributed to various panchayats was displayed and complete secrecy is maintained there also and even our investigators had lot of difficulty in getting the information. It therefore, appears that the most crucial step in any better performance of JRY is to ensure that the entire village community knows about the receipt of funds. This can be ensured by the traditional method of 'munadi', i e, announcing through beating of drums whenever any grant is received apart from displaying the information on some

Table 3: Percentage Distribution of Expenditure (as Recorded) on Wages in Various Activities

Total	73	2,243	2,316	71,457	36,694	30 85	15 84	560.96	293.49

prominent wall. Even if the block notice board displays this information the same will filter to the village level. It is our emphatic view that disseminating this information among the villagers is the one single most important step that will bring about a qualitative change in the situation.

As regards the provision for appointing a committee in each village to supervise JRY work we found that in no village such a committee was appointed. It is suggested that the block officials who have practically no work should be enjoined to constitute a committee in every village to monitor and supervise the work before any grant is released. Similarly monthly meetings to be called by the pradhan should be attended by some block official and if the pradhan does not hold meeting for three consecutive months the grants should be withheld.

The other serious lacuna appears to be the absence of any training of the pradhan and other members of the panchayat. If the members and the pradhans are given intensive training about the priorities of the works that should be undertaken and about the various provisions of the manual and its implementation, there is no reason to suppose that it will not result in substantial improvement in the working of the scheme. The manual provides that a maximum sum of Rs 50,000 can be spent by DRDAs/ZPs for training. This is highly inadequate if every member is to be trained. As the DRDA retains 20 per cent of the total JRY funds, the limitation of Rs 50,000 should be done away with and this amount should largely be used in training the members of the panchayats.

It is our strong view that not only priorities should be fixed for works to be undertaken under JRY but for important activities like afforestation, water and soil conservation and land development, etc, there should be specific earmarking of funds in percentage terms just as it is done for IAY and MWS. At least 50 per cent of the allocations should be reserved for the abovementioned activities.

One important issue in the proper utilisation of funds is as to who should be authorised to withdraw the funds and in what manner. Section 18 of the manual has rightly emphasised that the amounts for payments "should be drawn through a cheque". Further, "the cheque shall be signed by the head of the panchayat alongwith another person who has been specially authorised by the village panchayat by a resolution. The other person must be a member of the village panchayat or secretary of the panchayat. Payment of every amount should be authorised in the meeting of the village panchayat ..." The manual has provided for joint operation and the intention is quite clear that apart from the pradhan (head of the panchayat) the other person must be a member of the village panchayat who should be authorised by a resolution. The words "or secretary of the panchayat" only connote that if any panchayat has also an elected secretary he will jointly operate the account. In no case can it be construed that the block functionary called gram panchayat adhikari (GPA), in UP should operate the account jointly with the pradhan. But in UP the practice without any exception is that the account is jointly operated by the pradhan alongwith GPA who is a government employee and has a number of panchayats in his jurisdiction. By flouting the manual, the bureaucracy at least in UP has, in a way, maintained its control and supremacy in the affairs of the panchayat as the GPA by virtue of being a government functionary has a great sway over the affairs. In cases where pradhans are not well-educated and efficient we found that the GPA kept all the vouchers and the accounts and the pradhans just signed on the dotted line. Even otherwise the pradhan has to toe him as he arranges for the audit of the accounts and can make complaints against the pradhan. The latter easily succumb to his illegal demands. He may say that he has to give so much to higher officials and the pradhan has to yield. In a few cases we found that the GPA took 20 per cent of the grant for such purposes. We also came across a startling case where a tribal pradhan was asked by the block officials to handover the entire JRY amount for the marriage of the daughter of a block official and was assured that everything would be set right. The poor fellow obliged. Those pradhans who are themselves embezzling funds will naturally pass on the amount. Only those pradhans who are dead honest will refuse to pay the cut but we found that such persons were unduly harassed by the GPA and no one came to their rescue.

It is also our feeling that by making no provision for the audit fee and for the running that the pradhan has to do, one has to adopt dishonest means to meet these expenses. Not only provision for audit fee should be made but some travelling allowance and a modest honorarium should also be given to the pradhan during the period of execution of the works under JRY. This will be a more straightforward course.

Given the fact that pradhans have been in a large number of cases misutilising and embezzling the JRY funds and the fact that all power has been concentrated with them and they have successfully torpedoed all the provisions for forming committees to supervise the JRY work or to report about the various aspects of work being done to the village assembly, it will be proper to devise an alternative to the existing system. It appears to be advisable to form a separate committee which should not include the pradhan in each panchayat to execute the JRY work and the account may also be operated by two persons other than pradhan elected by this committee. The pradhan in that case will act as a watch-dog and will naturally see to it that no irregularity is done and all the provisions of the manual are strictly followed. The great advantage of this system will be that the pradhan having no control over JRY funds will strictly supervise the work and being the head of village panchayat, the committee which will execute the work will also be under the constant vigil of the pradhan.

JRY was started with the primary objective of generating additional gainful employment to the rural unemployed and underemployed and the secondary objective was to create sustained employment. It has failed to generate adequate employment to the rural poor and as regards creation of sustained employment it does not even address the problem. Creation of sustained employment by strengthening rural economic infrastructure can only materialise if there is an organisation to employ the workers on a regular basis.

There are various activities which can employ the rural poor on sustained basis within the rural areas. Soil and water conservation, afforestation, creation of irrigation facilities, water storages, construction of other infrastructure, etc, can generate adequate employment to absorb most of the rural poor in gainful employment on a sustained basis but what is lacking is an organisational set up to accomplish it. It was in this context that the First Five-Year Plan had recommended the creation of a regular land army to undertake these activities wherever they are required. In a decentralised set up such armies can be set up at the block level. The amount that is being spent on various employment generating programmes can well be pooled together to maintain a land army to undertake the abovementioned activities on a regular basis. An army of 50 lakh people drawn exclusively from the poorest section of the rural population can be maintained on what is being spent on JRY and other employment generating programmes yearly.[2] The land army should work in a strictly disciplined manner in the priority area of land and water conservation and afforestation, etc, unlike at present where JRY resources are going mainly to rural roads to be washed away in the next rainy season.

Notes

1 A study of JRY by Planning Commission had earlier found the mandays of employment of the same order, *vide*, *Jawahar Rozgar Yojana: A Quick Study*, 1992.

2 Employment to one person for 300 days in a year at the rate of Rs 30 per day will cost Rs 9,000 in a year. Providing for another Rs 1,000 per head on administration, equipment, material, etc, an allocation of Rs 5,000 crore will be sufficient to provide sustained employment to 50 lakh persons on a regular basis.

Regrouping in Indonesian Politics

M G G Pillai

The confrontation between the Indonesian army and the Muslim fundamentalist groups has pushed president Suharto into a corner.

WHEN president Suharto indicated that he would not stand for re-election in 1998, after 33 years in power, the inevitable regrouping of Indonesian politics and **pressure groups pitched the armed** forces **of the republic of Indonesia (ABRI) against the strongest pressure group, the Muslims. This tense but quiet** confrontation **inevitably paints president** Suharto into a corner. But he is still in a better position than his predecessor president Sukarno was in 1965, when ABRI put down a bloody, communist-backed coup in which a million people were massacred and the Parti Komunis Indonesia (PKI) was banned.

ABRI and the Muslim groups do not often confront each other but strengthen their position by closer alignment with president Suharto. But their differences get a wider audience now. Recently, an episode involving distribution of envelopes containing 5,000 rupiah notes (about US $ 1.90) and an injunction to "bunuh cini" (kill the Chinese), at street corners in several towns in Indonesia, led to random attacks on prosperous Chinese businessmen in Jakarta, Medan and elsewhere.

No one seems to know who distributed these notes, but if the aim was to create a law and order problem, the attempt failed. The anti-Chinese intensity of the 1950s and 60s is no more, and those attacked were individual rich Chinese with a record of ill-treatment of workers. But for weeks after, every flight from Jakarta was filled with Indonesian Chinese seeking a haven elsewhere. In Singapore, they were buying US$ 1,500,000 apartments with cash brought in briefcases.

Restive undergraduates in several universities, including Bandung, west of Jakarta, with their list of not necessarily anti-government grievances, the stiff jail sentences for the youthful critics of president Suharto, and the assassination of a brigadier-general in June have added to the widespread unease. In every one of these instances, ABRI is perceived to be confronting the Muslims, fundamentalist pressure groups and intellectuals.

Indonesian politics works through a system of consensual agreement, in which only the communists and atheists are excluded. ABRI has dominated politics since before Indonesia's independence in 1945, and the democratic process ensures its dominant, if not controlling, presence. The dominant political party is the Golongan Karya (Golkar, for short, and a federation of functional groups, including the armed forces). The only force that openly challenges this set up is the Muslim groups, which take the *bete noire* role from the PKI.

ABRI positions itself as the saviour of the country, with its 'dwi fungsi' (twin functions) of maintaining territorial integrity and playing an important role in the government and administration. The sharp reaction to the May conference on East Timor in Manila, and the beating up, in Kuala Lumpur, of non-governmental activists protesting against that decision outside the Indonesian embassy, reflect these internal tensions. In normal times, they would have been ignored.

The ferocity of the diplomatic pressure against president Fidel Ramos of the Philippines underscored ABRI's internal moves to reinforce control over the noticeable resurgence of Islamic forces. That Indonesia threatened to not host an important meeting between representatives of the Philippines government and the Muslim irredentist Moro National Liberation Front (MNLF), one which Jakarta had long strived hard for, indicated the seriousness of the situation.

What triggered the present confrontation is the systematic, though no longer low-key, campaign by the minister of heavy industry and research, Jusuf Habibie to succeed president Suharto in 1998 when Suharto has indicated he would retire after 30 years in power. An intensely ambitious German-trained aeronautical engineer who laid the groundwork for Indonesia's industrialisation, Habibie is linked to a prominent Muslim think tank, Institut Cendiakawan Muslimin Indonesia—Indonesian Muslim Intellectuals' Institute or ICMI. ABRI regards him as the intellectual apex of the current revival of a campaign to turn Indonesia Islamic. Indonesia, despite its 90 per cent Muslim population, remains avowedly secular. The Muslim groups want to change that.

A smear campaign against Habibie is under way. His critics, in ABRI and elsewhere, allege that refurbishing the East German naval ships, which Indonesia bought at Habibie's insistence, "far exceeds" the cost of better new ships. The World Bank criticism at the cost overruns of developing an indigenous Indonesian plane adds fuel to the fire. There are even calls to have him charged with corruption. But he is not alone. Another cabinet minister, admiral Sudomo, a Catholic who became a Muslim when he married his present wife, is implicated in the recent collapse of the Bapindo bank. Indonesian sources allege that his wife is a director of the Hong Kong company that had a substantial holding in the bank.

ABRI encouraged a new think tank to counter ICMI, called Persatuan Cendiakawan Pancasila Indonesia—Indonesian Panchashila Intellectuals' Association or PCPI—while actively cracking down on Muslim dissidents. The anti-Chinese riots, which seem to have been an attempt to divert attention, brought forth the infamous 'death squads', shooting down in cold blood thieves, robbers, gangsters, drug smugglers and, this time, Muslim activists. ABRI was widely linked to similar 'death squads' more than a decade ago.

Suharto, still in control, contains his anger but barely keeps the two groups from each other's throats. Indonesian sources say the ABRI action is focused on Habibie and his support for a greater national role for Islam. ABRI accepts Islam's importance in the national conscience, but only within a secular state.

But the Muslim objection is not to this alone. The flaunting of wealth, the widening disparity between the rich and the poor, the prominent role of the president's children in business have accentuated these pressures. His daughter, Siti Hardiyanti Rukmana, already Indonesia's sixth richest person with declared assets of 400 billion rupiah (about US $ 180 million), recently declined a cabinet position; she also leads the consortium that manages the toll road between Cengkareng international airport and Jakarta. Recently, the son of a prominent Indonesian was exiled when he turned out to be the principal importer of the narcotic drug, Angeldust. this followed the death of an Indonesian man, in the house of a prominent actress, of an overdose of Angeldust. This person is now in London.

PERSPECTIVES

Fertility Rate Decline in Tamil Nadu

Some Issues

R Savitri

Tamil Nadu has achieved a decline in fertility rates without the expected pre-conditions: decline in infant mortality rates, improvement of literacy rates and the bettering of the status of women. How is this to be explained?

THE population of India has grown considerably during the period 1901-91. According to one estimate, by 2035 AD India will have more people than China and by 2040 AD, India's population would exceed 2.5 billion. The tota' fertility rate (TFR) for India was 3.9 in 1989 (SRS figures), and a unique feature of it is that the rates varies widely among the states—from 5.2 in Uttar Pradesh to just 2.0 in Kerala. Tamil Nadu is the only other state besides Kerala with TFR less than 3.0. While the Kerala, low TFR is accompanied by low infant mortality rate, high rate of literacy and better status of women, this is not true of Tamil Nadu. There exist states which are socially and/or economically better than Tamil Nadu but with a much higher TFR.

Tamil Nadu seems to be a counter-example to many of the widely accepted hypotheses that lower infant mortality rate, higher literacy and better status of women are a must for bringing down fertility. This state has achieved a TFR of 2.5 without any of these accomplishments. In literacy, Tamil Nadu ranks second in India, the first being Kerala. However, while in Tamil Nadu only around 52 per cent of the females aged seven years and above are literate, this rate is as high as 87 per cent in Kerala (1991 Census). Besides, in respect of income and poverty levels also, Tamil Nadu does not rank high. In fact the state levels are worse than the all-India average. Though the socio-economic profile of Tamil Nadu is not very impressive, an interesting feature is that the state has the highest composite index of urbanisation[1] in India with even Kerala ranking only next to Tamil Nadu in this aspect.

Not just the economic profile but the state's social profile is also not very impressive. The infant mortality rate of the state was 68 per 1,000 live births in 1989, far above that of Kerala, which was only 21 per 1,000 (SRS figures). Sex ratio, an indicator of status of women is not favourable to females. Though the ratio (number of women per 1,000 men) at 972 is not very low, the fact that the sex ratio of children surviving is only 898 girls per 1,000 boys is indicative of higher female child mortality rates. The higher sex ratio for the population as a whole may be due to migration, although we do not have data to confirm this. Tamil Nadu has a relatively higher singulate mean age at marriage, but this is not a recent phenomenon. As per 1971 Census, also, age at marriage was not low. Since decline in fertility is a recent phenomenon, having started only in the latter half of 1980s, age at marriage cannot be identified as a major influencing factor.

What could have encouraged Tamil families to opt for the small family norm is indeed, a million dollar question. This paper reports the findings of a study to identify the factors responsible for inter-district and inter-temporal variation in fertility in Tamil Nadu.

Inter-Sectoral Analysis

As the only reliable source of districtwise information is census, the analysis had to be restricted to the 1981 Census data. Variables that were considered to analyse the variation in total fertility rate are population density, urbanisation, female literacy, marriage pattern, sex ratio, workforce and health facilities. Summary statistics, viz, mean, variance, smallest and largest values, median, first quartile and the third quartile for the variables mentioned above were used to compute the high, medium and low range for each variable. TFR was cross classified with the socio-economic variables taking one at a time to find out if the variables do have an influence on the fertility variations among the districts. The variables were considered to be linearly related when the districts fall diagonally in the table. If the districts were found to be lying scattered in the boxes without any particular pattern, it was concluded that the two are not linearly related. To illustrate this, the table on cross-classification of female literacy with TFR is given in Table 1.

Table 1 shows that the districts are uniformly distributed among the different classes, indicating clearly that TFR and female literacy are not linearly related. In other words, a higher female literacy rate does not necessarily lead to lower fertility rates, or vice versa. There exist districts like Periyar, with low female literacy rates but also lower TFR; and at the other end of the spectrum, districts like Thirunelveli and Kanyakumari which have high TFR despite having high levels of female literacy.

Of the 16 districts in Tamil Nadu, Periyar, Coimbatore, Madras and Salem rank as the first four from bottom, in TFR. On the other hand South Arcot, North Arcot, Ramanathapuram, Thirunelveli and Kanyakumari have comparatively very high TFR. Among the districts with low TFR, Madras and Coimbatore have high population density, urbanisation, female literacy and age at marriage, and also a low proportion of labour force in agriculture. These relationships are in the expected direction. However, while in Madras infant and child mortality rates are low, this is not true of Coimbatore.

In the other two low-fertility districts: Periyar with the lowest TFR and Salem which follows closely, none of the variables listed above seem to explain these low rates. Both districts are not doing well in the socio-economic front. Density and percentage urban population of these two districts are in the middle range. In Periyar, population density is only 252 and just 22 per cent of its people live in urban areas. Less than 30 per cent of the females are literate in these two districts. In Salem, the mean age at marriage is only 17.8, less than the legal marriageable age. Infant and child mortality rates are also not low and more than 50 per cent of their labour force are in agriculture.

In the case of the high fertility districts: South and North Arcot, Thirunelveli and Kanyakumari, the first two have, as would be expected, a low population density, low percentage of urban population, and low female literacy and age at marriage. The two also have high infant and child mortality rates. However, this is not so in the case of Thirunelveli and Kanyakumari. As a contrast, Kanyakumari which is among the high TFR districts has high density, high female literacy and quite low infant and child mortality rates. Age at marriage is the highest (20.3) in this district. Similar is the case with Thirunelveli also with high female literacy, high mean age of marriage, low IMR/CMR.

North Arcot and Periyar with the highest and lowest TFR respectively have the same

Table 1 Cross Classification of Female Literacy with TFR

		Total Fertility Rate: low	medium	high
LIT (FEM)	l	Periyar	Dh Puri P Kottai	S Arcot

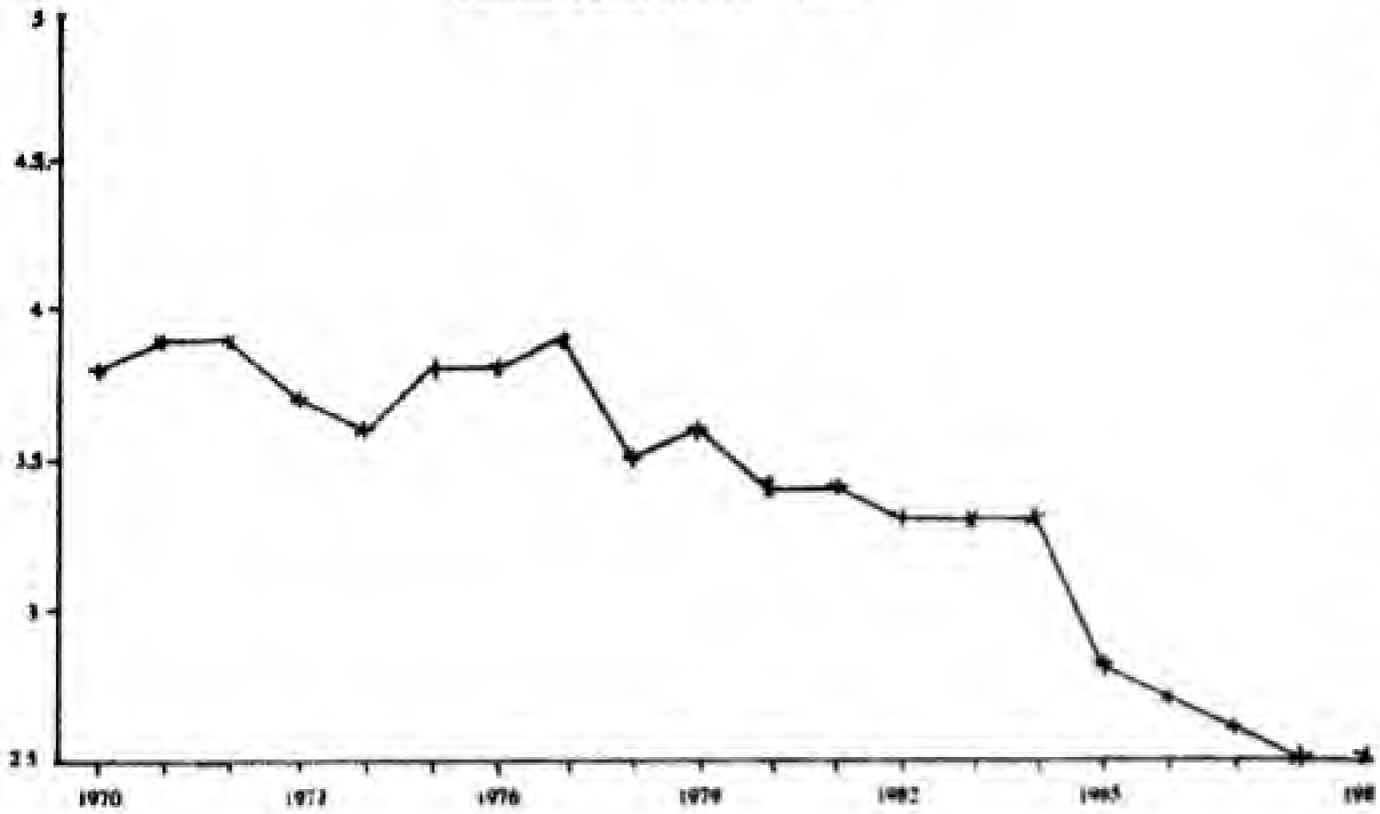
	h	Madras Coimb	Nilgiri	Thirunelveli Kanyakumari

Figure: Total Fertility Rate



the graph, during the period 1970-78, Tamil Nadu did not experience any steady decline in fertility. The rates were wavering. However from 1979, the rate started to decline. Also, during 1978-79, emergency was proclaimed in the country and forceful sterilisations were done. The sample registration system was also modified during this period. Considering all these, it was decided to divide the period under consideration into two parts—1970-78 and 1979-89. Kinked exponential model was used to estimate the growth rate with a kink at 1979. This method reduces the insensitivity of growth rate estimates to instability, and thus gives more accurate estimates of underlying trends. Kinked exponential models were fitted to total fertility rates in the rural areas, urban areas as well as to combined rates. The results are given in Table 2.

It is clear from Table 2 that Tamil Nadu experienced a fertility decline of more than 3 per cent in the 1980s. The Table also brings out the fact that rural-urban differentials during the period 1979-89 are negligible. But an interesting point to be observed here is that in the urban areas of Tamil Nadu, TFR has increased during the period 1970-79 at the rate of 1 per cent.

The age specific fertility rates for this period, viz, 1970-89 were examined to find out which age-group has contributed more to the fertility decline. The results are given in Table 3.

It can be seen from Table 3 that fertility in the age-group 20-24 has declined in rural Tamil Nadu. Contribution to fertility decline in rural areas of Tamil Nadu is uniformly spread among each age-group. Fertility rates in the age-groups (40-44) and (45-49) were quite low even in the earlier years (1970s), leaving not much scope for decline. As fertility started to decline only in the latter

sex-ratio. Same is the case with Tiruchi and Kanyakumari. While the sex ratio is the same in both these districts, TFR differs by 0.8 points. Again Dharmapuri and Pudukottai have a TFR of 4.3 but their sex ratios have a vast difference—959 in Dharmapuri and 1,007 in Pudukottai.

This analysis reveals that in Tamil Nadu, fertility does not seem to be related to proportion of urban population, female literacy, age at marriage, work participation or sex ratio of the population, and even to infant and child mortality rates in some districts.

However, it was also observed that none of the districts with high urbanisation level have high TFR as well; and that in all the high TFR districts, urbanisation level is very low. It appears that the fertility rate will surely decline once a particular level (more than 50 per cent) of urbanisation is reached. Similar is the case with labour force participation. Districts where more than 75 per cent of the labour force are in agricultural activities, the fertility rate also is not low. It is around 4.3/4.4. Also, districts with less than 50 per cent of the labour force in agriculture do not in general have high TFR. Thus, it is not the absolute number but the threshold point that seems to matter in case of urbanisation and labour force in agriculture.

Two other variables were considered in our analysis, in terms of their relationship to fertility levels. These are electrification, and provision of pucca roads. While the former did not show any systematic relationship to TFR in the different districts, provision of pucca roads in villages seems to have a negative relationship with fertility. The only exception to this is North Arcot district.

As observed above, sex ratio of the general population does not seem to influence fertility. We then considered sex ratios of children ever born and children surviving, and found that these do affect the fertility behaviour. In fact, these ratios are better indicators of status of women, as the general sex ratio is affected not only by differential mortality by sex, but also by migration. It was observed that in districts where sex ratio (calculated as number of females per thousand males) of children surviving is much lower than that of the children ever born, TFR is more than 4.0. The only exceptions are Salem and Thirunelveli. Sex ratio of children surviving is the highest in Thirunelveli, the district with the highest TFR as well; and the ratio is the least in Salem where the TFR is not very high.

Further to this cross tabulation analysis, multiple regression was carried out with the following variables: Child mortality, percentage of villages with pucca roads, and doctors per 1,000 population. Child mortality and road facilities explained only 46.44 per cent of the variation in TFR. However, the value of R-square increased to 86.88 per cent on exclusion of Kanyakumari and Madras, the outliers. Further addition of another variable, viz, doctors per 1,000 population increases R-square by less than 1 per cent. Thus child mortality and road facilities seem to be the most significant factors affecting fertility. Child mortality and road facilities are themselves highly correlated. Also, availability of pucca roads has a high negative correlation with percentage of labour force in agriculture. It was mentioned earlier that districts with low percentage in agriculture prefer to have fewer children as well. Sundari (1992) observed that work participation rate of females in non-farm activities has increased by more than 30 per cent in Tamil Nadu between 1981 and 1991. This has been made possible by the better rural-urban linkages in Tamil Nadu. Thus better road facilities by way of changing the labour structure, enabling better access to health facilities and influencing the thinking of rural people may have brought down the fertility rate.

Inter-Temporal Analysis

Data available from the Sample Registration System over the period 1970-89 on TFR was used for this analysis.[2] The rates over the years are represented in the form of line graph (figure). As can be seen from

Table 2: Estimated Change in TFR (Per Cent) by Residence

	1970-78	1979-89
Rural	–0.71	–3.87*
Urban	0.92	–3.67*
Combined	–0.37	–3.87*

*: Significant at 5 per cent level.

Table 3: Percentage Contribution of Each Age-Group to Decline in TFR during the Period 1970-89

Age-Group	Rural	Urban
15-19	9.3053	-5.4868
20-24	10.2922	-18.2698
25-29	24.6372	31.4724
30-34	27.8852	45.0538
35-39	20.7826	32.9398
40-44	5.7228	10.7056
45-49	1.3719	3.5895

Source: Calculated from SRS estimates of TFR and ASFR for the years 1970-89.

half of 1980s, contribution by each age-group during this period 1984-89 was also computed. In the rural areas, the age-group (25-29) has contributed the most (37.9 per cent) to fertility decline with the age-groups (20-24) and (30-34) following closely. These three age-groups have contributed more than 80 per cent to TFR decline. In the urban areas while when the whole period 1970-89 was considered, the fertility of the age-groups (15-19) and (20-24) showed an increase, during the period 1984-89 these had declined and contribution of the age-group (20-24) to fertility decline was as high as 22.8 per cent. Contribution of the age-group (15-19), though not very high, was also as much as 7.5 per cent. Thus during the latter half of 1980s, not only has fertility declined in general, but this has been especially significant for women in the younger age-groups.

A most intriguing question is what could have motivated the young Tamil women to opt for family planning. Socially as well as economically, there exist states which are better than Tamil Nadu, including in terms of infant and child survival, which have not experienced such an extent of fertility decline. In respect of poverty and inequality, Tamil Nadu's track record has been a sorry one. The index of per capita state income at current prices was as low as 92 in 1970-71 (below the all-India level). The index stagnated around 90 during the years 1970-71 to 1985-86. As regards operational holdings, the state is among the lowest. Total foodgrains production is also low. Total production ranged from 6.0-8.0 million tonnes during the 20 years period (1970-71 to 1989-90) in Tamil Nadu with the exception of two years, viz, 1974-75 and 1982-83 when the production was less than 5 million tonnes.

Considering the above, it was hypothesised that people have realised that they ought to reduce their family size to cope with the prevailing level of poverty. Lee (1990) has observed that fertility, mortality, nuptiality and migration all respond to economic fluctuations. In fact, the higher age at marriage in this state could also be attributed to poverty. A kind of economic crisis that according to Lee is likely to affect births is an increase in agricultural prices and reduction in agricultural output. Subramanian (1986) has pointed out that in Tamil Nadu the relative rural-urban poverty pattern betrays a close relationship to the relative rural-urban price level ratio. Gaiha (1989) also demonstrated that "while rural poverty and agricultural production were inversely related, the effect of the latter at the state level was either weak or absent. The effect of price fluctuations, on the other hand, was consistently strong and often decisive". Ghose (1989) also showed that higher relative price of foodgrains has poverty-increasing impact. Considering these arguments and the fact that overall fertility decline is more closely associated with what happens in rural areas, the effect of The Consumer Price Index of Agricultural Labourers (CPIAL) in respect of foodgrains on TFR (rural) was studied. The methodology followed was as set out in Lee (1981). The model suggested is a distributive lag model in which lags of up to four years are included but lags of up to 2 years can be used for shorter data series (shorter meaning a series less than 30 years long). The model proposed is as follows:

$$\ln Y = a+b_0\ln p(t)+b_1\ln p(t-1) +b_2\ln p(t-2)+b_3\ln p(t-3)+e$$

where Y is TFR (rural)

p(t-i)s are CPIAL (foodgrains) lagged by i years

a, b_is are constants and e is the error term

Applying the above model on time series data from 1970 to 1989 using TSP programme, it was found that current prices and prices lagged three years were found to be significantly influencing fertility levels.

$$\ln \hat{Y}=1.547+(-0.21)\ln p(t)+(-0.17)\ln p(t-3)$$

(7.91) (-3.24) (-2.78)

R^2 = 92.8 per cent

The sum of the lagged coefficients is -0.38. As the data were first logged, the coefficients are elasticities indicating the ratio of proportional change in fertility to a proportionate change in prices. From the coefficients, it can be inferred that a 10 per cent increase in foodgrain prices would lead to 3.8 per cent decline in fertility.

Conclusion

Analysis of inter-district variation in fertility has brought out that availability of road facilities and child mortality are the most important factors influencing fertility in Tamil Nadu. At the state level, percentage of villagers, with all weather roads in 1984 was quite high at 79.7 per cent. As per an economic appraisal of Tamil Nadu conducted in 1984-85, the total length of roads in kilometres has increased by 45 per cent during the decade 1971-81. It is interesting to note that major contributors to this increase are the non-major district roads and village roads and roads maintained by panchayats. These two classifications have undergone 90 per cent and 79 per cent increase during the same decade. Better transportation facilities imply better connections between rural and urban areas. As mentioned earlier, the composite index of urbanisation which includes besides percentage of urban population, rural population served by urban centres and distance to the nearest town is the highest in Tamil Nadu. These imply that the rural-urban linkages are quite strong in Tamil Nadu.

When rural TFR was regressed with consumer price (of foodgrains) index of agricultural labourers, it was found that these two are highly correlated. Thus poverty combined with better rural-urban linkages seems to have influenced the fertility behaviour in Tamil Nadu. This goes against the common belief that poor tend to have more children. In general, fertility is, for many parents, a balance between the costs and benefits of having children. In a poor family benefits may be more than the costs as in these families more the children mean more are the hands to work. But in Tamil Nadu, the scenario may be quite different. Rural-urban connectivity has enabled the rural people to take up jobs in the urban areas without shifting their residence to urban areas. This, no doubt, would bring about a change in the attitude of the rural people. An outcome of urban influence is that the couples in rural areas also want to educate their children which naturally would mean higher cost of child rearing. Also, it could have helped the people to realise that they can lead a better way of life and can cope better with the increasing price situation by reducing their family size. Further the female labour force participation in non-farm activities has gone up in the 1980s. This has again been due to good transportation facilities in the villages. Once females start going out of the village to work they would naturally desire to have fewer children. Thus, the findings of this study have generated interesting, new hypotheses which need to be validated with district level data for 1991 and qualitative studies.

Notes

[This paper is based on the Project Report entitled 'Regional and Temporal Variation in Fertility in India: A Comparative Study of Tamil Nadu and Maharashtra, submitted in partial fulfilment for the award of the Postgraduate Diploma in Population and Development, Centre for Development Studies, Trivandrum, 1993.]

1 Variables included for calculating the index are urban-population ratio, rural population served by urban centres and distance to the nearest town.

2 Using the SRS data on TFR and ASFR for the period 1970-89, percentage contribution of each age-group to decline in the TFR during this period was worked out. Separate regressions were fitted for each age-group with time as independent variable and ASFRs and TFR as the dependent variable. Contribution of ith age group is given by $(b_i/b)*100$ where b_i's and b are the coefficients of regression fitted with the respective ASFRs and TFR.

Assessing India's Political Economy

T V Sathyamurthy

The Painful Transition: Bourgeois Democracy in India by Achin Vanaik; Verso, London (distributed by TR Publications) 1991; Rs 320.

A lapse of well over two years since its publication notwithstanding, this is perhaps a more appropriate moment to review Vanaik's analysis of India's 'bourgeois democracy' than immediately after it appeared. During the last 10 years, India has been experiencing changes of a deep-rooted nature. Some of these are incremental in character, the seeds having been sown much earlier; others are qualitatively new. Together they have altered the political, economic, social and cultural fabric of India, and contributed to an undermining of some of the basic assumptions upon which much of the intellectual (particularly, English educated) consensus on the nature of the Indian polity rests.

On the political dimension, acceptance of the institutional appurtenances of electoral ('representative') democracy in India as evidence of the substance of the rule of democracy has survived the Emergency, though weakened by it. On the economic dimension, India has traversed a long and winding road—from Mahalanobis's mixed economy with emphasis on the public sector and central planning, and Raj's application of Kalecki's theory of 'intermediate regimes' to Indian conditions, to the pressures that led to the Green Revolution and, in turn, the pressures generated by it.

The Indian economy has wavered, eclectically, between alternative and opposed models of development—import substitution and self-sufficiency orientated, and export promotion and private (national and international) capital orientated. Ultimately, we have been witness for some years now to the spectacle of India as beggar No 1 knocking at the doors of international and global capital. Has not the world title of 'Finance Minister of the Year' been recently bestowed on that indefatigable anti-hero of this *denouement*, Manmohan Singh?

In this sphere, with the exception of certain strands of Gandhian thinking, the original consensus on the role of the state in economic development (1955-1975) was shared by Marxists and non-Marxists alike, albeit from opposing perspectives. Non- and anti-Marxists believed that a strong state sector was a necessary prelude to the emergence of a fully-fledged industrial bourgeoisie, whilst Marxists believed that a strong role for the state in the economy would fortify proletarian and democratic forces and keep the national bourgeoisie under control.

Of the social and cultural pressures that have gathered momentum in recent decades—the mounting insecurity of the marginalised sections of rural and urban India (a majority of whom are dalits, adivasis, scheduled castes, minority communities and women), and the rise of anti-secular political forces which pose a threat to religious minorities are the most serious and insistent ones. Much of the intellectual output of Indian and non-Indian social scientists has been marked by a spirit of complacency, and misplaced confidence that the 'democratic' structures of power in the Indian political milieu are durable, and that the Indian ruling classes would always prefer consensus to conflict where their interests ran against the interests of the mass of the people, that intra-ruling class contradictions could be resolved by manipulating centre-state relations, and that 'secularism' had a permanent and unchallenged future ahead.

These assumptions have been severely shaken by the rise of communalism as a political force which is by no means confined to the different constituent segments of the Sangh parivar. In fact, communal tendencies are present even in major political parties at the national and regional levels which claim to be secular and anti-communal. Most prominent among these is the Congress(I) itself in which a communalist lobby has wedged itself in a powerful position over a long period of time. Since the assumption of power by the Indira Gandhi (Mark II) government in 1980, the Hindu communalist tendency within the Congress(I) has reared its head in different parts of the country with predictable electoral results (up to a point, it must be added by way of qualification!).

A comparison of the development of communalism in contemporary India with the experience of Europe with fascism (whose main feature was its anti-democratic and populist character) in the inter-war years would point to the salience of the economic factors at the root of socio-cultural changes. They must be identified and analysed in order to grasp the forces at work in the current situation. Vanaik's book, which devotes a long chapter to communalism and Hindu nationalism (Chapter 4), represents an attempt to provide an analytic framework for such an understanding. At the same time, it must be noted that the main contention of the book, which is also its most problematic feature, is that, despite obstacles and shortcomings, India has achieved the status of a successful bourgeois capitalist economy during the first four decades of independence. Translated into international terms, this would mean that India has achieved regional prominence and a corresponding degree of global influence. Before attempting to provide a critique of the book, it would be appropriate to draw attention to the salient features of the development of Vanaik's assessment of India's political economy.

The book begins with a statement, cruelly belied by developments during the 80s and 90s, to the effect that among third world countries (presumably, including China!) India has the most powerful state and a national bourgeoisie with the greatest degree of autonomy from foreign capital. The main points made in Chapter 1 ('State and Economy') are in respect of the extent to which the Indian state has enjoyed autonomy in determining economic and social policy, the relative dominance of the different segments of India's propertied and capitalist classes, the impediments in the way of the Indian economy achieving a smooth rate of growth, and inevitably the question of how India's growth has compared with China's.

Vanaik's analysis is weak on the characterisation of the unevenness of the development of capitalism in India, the distorted character of capitalism caused by insurmountable problems (not least of which has been the difficulty experienced in bringing industrial and agricultural development into alignment with each other) in the sphere of indigenous accumulation of surplus needed by industry to fire the engines of production, and the limitations of the state in providing the kind of succour needed by Indian capital to overcome its deepening and irreversible dependence on international capital. Furthermore, comparisons with China are misleading and spurious not least because of the fundamental differences between the two political economies, their starting points in the late 40s, and their very different trajectories.[1] Chapter 1 of the book, which sets the scene, ends with a highly problematic characterisation of India's political economy and does not come to grips with the realities of India's rapidly deteriorating predicament since the mid-80s.

On such an unsound theoretical foundation, Vanaik constructs Chapters 2 and 3 which attempt to describe the main events in independent India's political history in class and structural terms. The main theme of

larger bourgeois democratic framework". India's political instability has been well documented but the discussion remains largely confined to the realm of horizontal (i e, intra-ruling class or bourgeois) conflicts which, despite their severity on occasion, have been kept from posing a threat to the constitutional mechanism of government.

Intra-ruling class consensus stems not from a conviction that India's unity and integrity (so beloved of the Nehru dynasty) is, in and of itself, sacrosanct (or to use Naipaul's vivid phrase, the essential ingredient of the 'sacrament' of independence), but rather from a utilitarian assessment of the Indian state as the most suitable site for the contending fractions of the ruling class to achieve their goals. In other words, a political split should be avoided which is likely to result in a division of the country. Thus, the main threat to the legitimacy of the Indian state arises not from the dominant class fractions in opposition to one another, but from the vertical contradiction of Indian society between the dominant classes as a whole (and hence the Indian state) on the one hand and, on the other, the oppressed peoples of the country who, over the last three decades, have had to defend themselves against an increasingly oppressive and coercive state.

Vertical Contradiction

The vertical contradiction between the dominant and oppressed classes has not been given the importance that it deserves in the literature on post-independence India, and Vanaik's book, sadly, is no exception. To be sure, the state has crushed all the organised insurrectionary struggles (from Telangana to Naxalbari and beyond) involving people's movements. Unlike the popular struggles against state power, however, regional autonomy movements led by local ruling classes (= castes) (drawn from the agrarian rich in some areas and non-productive but middle to high caste elements in others) have succeeded in compelling the Indian state to accommodate itself to pressures towards a partial decentralisation of power. But the popular upsurges in India, far from disappearing from the political scene, have continued to reproduce themselves in different forms over different clusters of issues. Despite their apparently fragmented character, they share a common denominator of opposition against the state and the ruling classes by virtue of the social (e g, caste), gender, economic (poverty and deprivation), cultural (e g, minorities such as the Muslims and Sikhs), and psychological oppression that they have to endure. Any study of economic and political change in India which does not accord a central place to this major contradiction of Indian society cannot throw sufficient explanatory light on the developments in the subcontinent. One of the crucially important aspects of state power in India is that, over the last three decades, its much touted 'near omnipotence' has shown a tendency to a high degree of unevenness. Thus, since the Emergency, the influence of the Indian state (in sharp contrast to that of the Chinese state) in the international arena has been systematically reduced to a point of relative unimportance. Even its significance as a regional power has been undermined in recent years.

A brief comparison between the Chinese state since the Revolution and the Indian state since independence is appropriate to this discussion. A powerful state was moulded out of the revolution in China. It addressed the task of removing poverty, socialising production (also centralising power) and developing mechanisms for securing as even a distribution of essential commodities throughout the country as practicable. Paradoxically, the Chinese state was well placed to benefit from three decades of relative international isolation; internally, it exercised an effective check on 'class enemies' (variably defined from time to time), and undertook a long-term policy of eradicating poverty (even though differentials between the poor peasantry and urban workers, to cite only one example, persisted). When, during the late 70s, those in control of state power radically altered the direction of China's development towards greater openness (to foreign investment and participation), competition (domestically and internationally), retrenchment of the public sector (without the state, however, giving up any part of its overall control over decision-making), and, in effect, a partial reversal of its ideology, the society as a whole had already achieved concrete gains at its base without which vertical class contradictions in any society could not be kept at a non-antagonistic level. Now that China is into its second decade of this new phase, strains have begun to appear which pose a threat to the social fabric, and which could take China on the path of uneven development beyond a point of no return. But the political leadership of China is aware of the importance of keeping the power of the state in tact in order both the monitor external influences (the need for which is acknowledged) and to contain internal opposition (which is likely to gather momentum not only in urban intellectual circles but also in the rural areas where the gains of the first three decades of progress are seen to be undermined).

The contrast between the above picture and the Indian state's response to recent developments in the country could not be more diametric. At independence, the Indian state was so structured as to maintain an equilibrium between antagonistic classes whilst enabling the dominant classes (in particular, the national industrial bourgeoisie) to lay the foundation of a capitalist economy. As the vertical contradiction between the dominant and oppressed classes deepened (mainly as a consequence of uneven development of capitalism and the failure of the state to persuade the newly arisen rich and middle peasant classes to channel a portion of the surplus augmented by the Green Revolution to industry), the coercive and oppressive power of the state was raised to ever higher levels. It was directed with special force against popular uprisings and people's movements. At the same time, the Indian state (especially since the Emergency) became more and more exposed to pressures from abroad and from within.

Until and through the Emergency (the Indo-Pakistan war over Bangladesh being, undeniably, the high point of this period), the political leadership was able to keep alive the myth of the omnipotence of the Indian state. The Emergency gave rise to a new awareness on the part of large sections of the Indian people that their civil, democratic, and fundamental human rights were no longer safe and they could hope to hang on to them only by mounting struggles against the state. The forces of opposition briefly united together to demonstrate to the ruling elements their determination to retrieve their basic rights which the state believed it could steal with impunity by imposing an internal Emergency. By the same token, the horizontal contradiction (especially that between the national industrial bourgeoisie on the one hand, and, on the other, the regional bourgeoisie in a number of areas, often of recent provenance, which reflected the interests of a variety of class segments—ranging from small businesses to the agrarian rich) posed a threat to the centralised and unitary conception of politics under a single umbrella in the form of a homogeneous and tightly knit political leadership perpetually in power.

The arena (provided under the constitutional rubric) of 'Centre-State relations' witnessed a new and more radical phase of activity leading not only to fairly painful adjustments on the part of the Congress(I) but also to a sharing of power between the political representatives of different segments of the Indian bourgeoisie.

Thirdly, in the economic sphere, the emptiness of the rhetoric of the 'socialistic pattern of society' stood thoroughly exposed, with India's absolute poverty (as revealed in figures for the proportion of the population living below the poverty line at any given time) staying put at staggeringly high levels; at the same time, the different segments of the national bourgeoisie reached the conclusion that, as the Indian state had ceased to be the most effective or useful channel for the advancement of their interests, the urge towards liberalising the economy by opening the door to increased private foreign investment and rolling back the public sector economy was provided by the realisation that dependence on external sources of capital would be a better alternative to stagnation within a framework of autonomy and independence. For the hundreds of millions of poor in India it would mean (as it, indeed,

already does) the superimposition of a new phase of external dependence (under harsh conditions of structural adjustment) upon three decades of anti-people policies practised in the name of poverty alleviation by a state which has become a more or less spent force internationally and lost much of its steam in the eyes of the ruling classes. Unlike the Indian state which is desperately seeking to implement policies imposed by the GATT and eager to accept the conditionalities of the IMF and the Dunkel proposals, China has shown itself to be in a position to lay down the terms under which it expects to advance during the new phase of its economic development. In both cases, the interests of the poor (or the weaker sections of society) are being heavily compromised. In the case of China, it can be said that at least during the first three decades of the Revolution the poor fared better than they have ever fared in India.

This contrast between the two Asian powers has been clearly registered in the recently adopted attitude of the US. The May 1994 'working visit' of the Indian prime minister, ending on an ugly note thanks to the racist public behaviour of the Indian delegation in Boston, has been singularly ineffective. During the same week as the Indian prime minister's visit to America, president Clinton announced that his government had decided to extend China's MFN status for another year and to delink the issue of human rights from the issue of trade in China's case. China's adamant refusal to bow to American pressure has paid off.

Chapter 2 is thus presented wholly in terms of the relationship between the Indian state and the national bourgeoisie, and of wholly ignoring the political dynamic underlying the discourse of the mass of the people as reflected in the numerous popular struggles in which they are involved. The severe limitations of such an unbalanced and partial approach become clear in the discussion of centre-state relations in Chapter 3. The main difficulty arises in Vanaik's categorical rejection of "any characterisation of India as a 'multinational' state" and equally categorical assertion that "India is very much a nation-state which...has 'solved' the 'national question'" (even, presumably, including the Kashmir question which is proving, each day, to be a more and more irresistible challenge to the Indian state!). In other words, provincial, regional, and sub-national (and, even, sub-state) identities can be asserted without laying claim to statehood.

We have already noted that such assertions of sub-national identities constitute a well-worn method of accommodating divergences between different segments of the dominant classes which have a vested interest in the maintenance of the power of the existing state structures. Thus, the interval between the publication of the Report of the Rajamannar Committee (appointed by the DMK government of Tamil Nadu during the late 60s) and the publication of the Report of the Sarkaria Commission (appointed by the Indira Gandhi-Mark II government during the early 80s) can be regarded as constituting the entire chapter of centre-state relations in the history of India since independence. They brought to a conclusion the work begun by the States Re-organisation Commission (under Faz'l Ali, as chair) during the mid-50s.

However, throughout the 47 years since independence the contradiction between the Indian state and the mass of the people (including, in particular, the economically disadvantaged, and those belonging to the lower castes, adivasis, minority communities, as well as women) has never abated. Under conditions to which the current policies of liberalisation will give rise, politics in India are likely to become more and more confrontational. At the heart of these confrontations lies a fundamental rejection of the Indian (nation) state around which inter-party (including the left parties) and intra-ruling classes' consensus has gelled over the last four decades or so. These confrontations (i e, between the mass of the people and the Indian state) will necessarily result in changing the institutional and theoretical categories which provide the *raison d'etre* of the Indian state, and compel a re-definition not only of the Indian state but also of the term 'nation' as well. Admittedly, this is a long drawn-out struggle of which the weakening of the sinews of the state as presently constituted is but one aspect. Regrettably, Vanaik has denied himself the opportunity of considering the possibilities arising out of the sharpening vertical contradictions of Indian society by starting with a rigid and sclerotic definition of the Indian nation state. This, unfortunately, weakens the discussion of communalism and Hindu nationalism in Chapter 4.

Hindu Nationalism

Chapter 4 faithfully reproduces the linearity of reasoning which is characteristic of the book as a whole. Thus, Vanaik argues that, as in other cases (presumably, 19th and early 20th century Europe), in India too religious hegemony in civil society is being systematically replaced by secular-democratic hegemony with greater industrialisation and urbanisation, the rise of the capitalist state and the consolidation of the basic institutions of civil society. Again, citing his understanding of India in the tension between different segments of the bourgeoisie as a whole rather than between the bourgeoisie as a whole and the mass of the people, Vanaik sees no incompatibility between the preservation of the bourgeois democratic system in broad outline and, within it, the project of de-secularisation and Hinduisation of the polity spearheaded by "the agricultural bourgeoisie and petty bourgeoisie".

By an extraordinary twist of logic, Vanaik propounds the view that there is scarcely any incompatibility between "the maintenance of a stable and strong democracy in the West and increasing racial oppression of a minority of the population"; by the same token, "India's weak (but functioning) democracy" and the weakening of the secular content of its politics can comfortably co-exist. In other words, the equilibrium between these two forces, despite the undermining effect of the latter on the former, will be seen by "aspirants to national authority" as necessary to "preserve the secularisation of the Indian state with at most some adjustments here and there". There is another name to this kind of thinking—viz, hard boiled political cynicism. As witness to recent events in Ayodhya and events currently unfolding in places such as Vrindavan and Varanasi, we may well raise the question as to what may the "adjustments here and there" be, which those in control of state power will feel impelled to make?

Hindu nationalism has been revived during the last two decades not only by the BJP and communal Hindu organisations but also under the combined auspices of all the mainstream national and regional parties—with the exception of the three main communist tendencies, the socialists and the Janata Dal—which have not scrupled to use religion for electoral purposes. Thus, Hindu nationalism has become imbricated with Indian nationalism. At the level of analysis, Vanaik makes two sets of useful points. First, the conceptualisation of communalism (by historians such as Bipan Chandra) as a diametric opposite of nationalism does not adequately take into account the actual fact that there are powerful forces which promote de-secularisation in civil society which must be tackled at the societal level precisely because de-secularisation presents itself as the dialectical opposite of the state's project of promoting secularisation of politics.

However, the action alternative suggested by Vanaik to the liberal-left rhetoric of anti-communalism is far from satisfactory. Vanaik believes that nothing can be gained by relying on bourgeois political parties or the state. In this he is right. The project of secularisation must be one of conscientising the people and persuading them to see the concrete advantages of secularisation over de-secularisation. Vanaik's suggestion sounds limp particularly in view of the fact that not only has he ignored the concrete struggles that the vanguard-less (i e, not under the aegis of Marxist leadership) mass of the people have been waging on this front, but he also casts the mass of the people in the mould of passive consumers to whose better sense an appeal must be made in the name of secularism.

Again, the reason for the dissatisfaction caused by Vanaik's undoubtedly well-intentioned suggestion of an alternative to the panacea—now on show in the ideological shop windows fronted by India's English educated comprador secular intelligentsia—must be sought in his failure to start with a more

dynamic blueprint of what has been interestingly misconceived by Naipaul as "a million mutinies" in an altogether different context (of one of his numerous voyages of self-discovery to India). The case of Punjab is added as a tail to the substantive discussion contained in Chapter 4. Curiously, the spectre raised here is the communalisation of the Sikhs instead of the Indian state which has meted out a shamelessly communal treatment to all sections of the Sikh community during the last quarter of a century.

Chapter 5, which attempts to identify the agencies of change, begins with a critique of the role played by the communists in Indian politics. Vanaik traverses this by now familiar territory with an interpretation of the 'peculiar trajectory' followed by Indian communism and an examination of the dynamic underlying its fissile ideological character. The mainstream left parties are viewed as representing the forces of regionalism rather than the working classes of industry and agriculture. Tamed into the ways of parliamentary electoral competition, with their original revolutionary programme abandoned to all intents and purposes, the two main communist parties—CPI and especially the more successful CPI(M)—have shown themselves to be capable of exploiting communal divisions by taking sides and drawing electoral support from one or other of the contending parties claiming to represent the interests of minority communities (especially the Muslims, as in Kerala). Whilst the main Marxist parties have distanced themselves from the unorganised sectors of the struggling masses, the smaller and more radical political formations have tended to identify themselves with specific causes in an atmosphere of growing ideological uncertainties and cultural fragmentation.

India is yet far from forging a structured alliance "among all the forces struggling for systemic change". Vanaik stresses the importance of not underestimating the power and reach of the Indian state. Whilst this is a perfectly justified caution, it is equally important to place the position of the state in perspective and to appreciate the opportunity provided by the downward trend in its capacity to accumulate power against mounting international and domestic pressures. On the agrarian scene, Vanaik, in keeping with the rest of his narrative, has given greater stress to the side of the dialectic pertaining to the ability shown by a recalcitrant rich peasant class to 'hegemonise' the poor peasantry and agricultural labour, whilst ignoring the powerful struggles waged by the poor peasantry in certain parts of India (e g, Bihar and Andhra Pradesh) against the rich peasantry and its allies in the local polity and bureaucracy. On the urban industrial and service sector scene, Vanaik has failed to rise above the level of platitudes.

The Trotskyist nostrum of permanent revolution would work, according to Vanaik, if the poor peasantry and the industrial working class would forge political alliances and undertake "a long march to liberation". In the meantime, the Indian national bourgeoisie will no doubt attempt to increase its autonomy and expand its domestic market. Unfortunately, this scenario is vitiated by the fact that rural and urban mass politics are likely to follow new paths in the absence of a widely acceptable 'vanguard' force, and that the autonomy of the bourgeois capitalist class is already severely compromised even although it is still far from sinking to a comprador status. Trotsky's revolutionary blueprint thus remains as impractical today as at any time in the past, with its theoretical flaws stemming from a lack of appreciation of the dialectical process at work in India's political and social economy.

Vanaik's assessment of India's external relations and foreign policy strategy, with which he concludes the book, relies on the "regional (in this case, south Asian) big power" thesis which differentiates between India and Pakistan, endowing the former with a greater degree of autonomy. The humiliating defeat of India at the hands of China in 1962, the generally cavalier attitude of India towards small neighbouring countries (except when non-Congress governments have been in power), the nuclear policy of India since 1971, not to mention the entrenched antagonism between India and Pakistan (for which not only Pakistan but also India must accept responsibility) especially over the nationality question as it affects contested regions (e g, in particular, Kashmir) are interpreted against a backcloth of *realpolitik* which reeks of theoretical staleness. The Indian government's policy of repression against the peoples of its north-eastern frontier, of duplicity practised against the Sri Lankan Tamils (with the collusion and connivance of the political parties of the state of Tamil Nadu), of silent annexation of Sikkim and intimidation of Bhutan and Nepal, of hob-nobbing with the odious regime of the Shah of Iran during the 70s are cited as evidence of India's success in varving out a local version of the Monroe Doctrine for south Asia. In the same breath Vanaik blandly declares India's non-alignment to be a success[1]

India's communist parties are beaten with the stick of ideological slavery to the Soviet and Chinese communist parties in a simple-minded manner. The final section of Chapter 6 is devoted to demonstrating that despite domestic political instability India, unlike Pakistan and Bangladesh, can expect to remain stable in its external affairs. Quite apart from giving out echoes of petty bourgeois national chauvinism, Vanaik's analysis is dangerously unhinged because it flies in the face of elementary reality so clearly visible to the naked eye. The present picture of India's external reality has been in the making for the last 15 to 20 years. It is grim and consists of little hope for the future of India's autonomy, for the amelioration of the deepening poverty of the mass of the people, and for the increasing antagonism between different segments of the capitalist classes which will inevitably engulf the country in violent conflicts in which the working classes will suffer.

Vanaik's contribution falls short of what readers could legitimately expect from a Marxist analysis of Indian politics. Its failure can be traced to the erroneous characterisation of the Indian ruling classes and the post-colonial state of India. Its theoretical poverty is attributable to its Trotskyist moorings. At the present juncture, the India of the poor and oppressed masses is at a crossroads. The communist and other left parties have signally failed them whilst the strongest among the organised left political forces have been content to transform themselves into parliamentary turncoats without injecting a new sense of urgency to the working of bourgeois democratic institutions. The two main organised forces of opposition are basically populist in character; of these, the Hindu communalist parties share a number of economic and other aims with the ruling party at the centre, whilst the other is genuinely oppositional in taking up the cause of the lower and lowest castes in its propaganda, but pathologically disunited.

In such a political milieu, it has not been difficult for the Congress(I) to rule by default and impose profoundly anti-people and anti-poor (the two terms should be distinguished from one another and used separately) policies with practically no parliamentary accountability. What the poor masses of India need, therefore, is not a vanguard party or movement, but a theoretical practice and an ideological formulation which can be evolved from the livid experience of struggle in which many segments of the populace have been engaged in different parts of the country on a variety of issues since the internal Emergency. Sadly, such of us who have been looking for signs of such a breakthrough will feel disappointed by Vanaik's contribution to the debate on India.

Note

1 Viz. (i) 'Socialist Construction' in China, as contrasted with policies in India which gave only marginal importance to distribution whilst according much greater importance to centralised production and managing the economy in such a manner as to open the way for the bourgeoisie to benefit from the state, (ii) China's *bouleversement* from "Socialist Construction" to state-managed capitalism with a fine tuned orchestration between decentralised production and international participation controlled by a powerful state, in contrast to India's somersault from a centralised economy (under the direction of an apparently strong state in which planning became more and more obsolescent since the mid-70s onwards) to a state which is considerably weakend in the international context and an economy which is desperate to sell off its assets to the first bidder from abroad

Agriculture under GATT: What It Holds for India

Ashok Gulati
Anil Sharma

This paper attempts to analyse the likely impact of India's commitments on agriculture and Intellectual Property Rights, especially commitments pertaining to market access, domestic support and export competition in the area of agriculture.

THE long drawn talks on General Agreement on Tariffs and Trade (hereafter GATT), which dragged on for more than seven years have come to an end. The world trade treaty aimed at opening international markets was finally signed in April 1994. In fact eight rounds of negotiations to free international trade have been organised since the inception of GATT in 1947. The first round of GATT to set the rules of international trade was held in Havana in 1947, which produced a charter for the International Trade Organisation (ITO).[1] Since then seven more rounds have taken place,[2] the eighth in this series which is commonly known as 'Uruguay Round' was initiated in September 1986 at Punta del este, Uruguay. This round has been the most difficult and complex one as it covers new areas like agriculture,[3] services, banking, insurance, telecommunications, etc.

The main objective of GATT treaty is to reform world trade which is highly distorted because of direct and indirect subsidies that flow to various sectors of the economy in various countries of the world. In case of agriculture, specific attempts have been made to measure the degree and extent of distortion in the world trade by some studies like that of Johnson (1971 and 1991), Anderson and Hayami (1986), Islam and Valdes (1990) and Tyers and Anderson (1992). These studies reveal that direct and indirect subsidies, which flow to the agricultural sector, manifest themselves into distorted world prices of agricultural commodities. These distorted world prices, in turn, result into a situation of deceptive comparative advantage that leads to inefficient use of world resources, which ultimately leads to efficiency and welfare losses around the world. Therefore, the underlying philosophy of GATT treaty is to correct these distortions in world trade of agricultural commodities with a view to promote efficient allocation and use of world resources.

India is one of the approvers of this trade treaty. In this context, it becomes important to study the likely impact of GATT on various sectors of Indian economy. The prime focus of this paper, however, is to gauge the likely impact of this agreement on Indian agriculture by analysing the various commitments under GATT in the area of agriculture.

The GATT commitments in the area of agriculture fall under three main categories, namely, market access, domestic support and export competition,[4] which are discussed separately in the following Sections I to III. An attempt is also made to present a scenario relating to trade in agricultural commodities in the post-Uruguay round of GATT in Section IV. This section also tries to identify the commodities in which India can gain from international trade. Section V contains concluding remarks of the paper.

I
Market Access

Under market access commitments, all member countries of GATT are required to (i) replace all types of non-tariff barriers with tariff barriers,[5] and (ii) reduce the levels of tariffs under a time bound programme. These levels are to be reduced by 24 per cent in case of developing countries and by 36 per cent in case of developed. The period during which these reductions are to be taken up varies from six years in case of developed countries to 10 years in case of developing countries. The least developed countries are not required to undertake these reductions. In addition to these commitments, this measure also calls for maintaining current access opportunities and the establishment of minimum access tariff quota. This minimum access tariff quota is to be established at reduced tariff rates for those basic products where the current market access is less than 3 per cent of domestic consumption. During the implementation period this minimum access tariff quota has to rise gradually to 5 per cent of domestic consumption. However, if there is a surge of imports due to unfair trade practices when these steps are being implemented, the special provisions of the agreement allow any country to impose additional duties. The extent of these additional duties will depend upon the difference between the import price and the trigger price.[6]

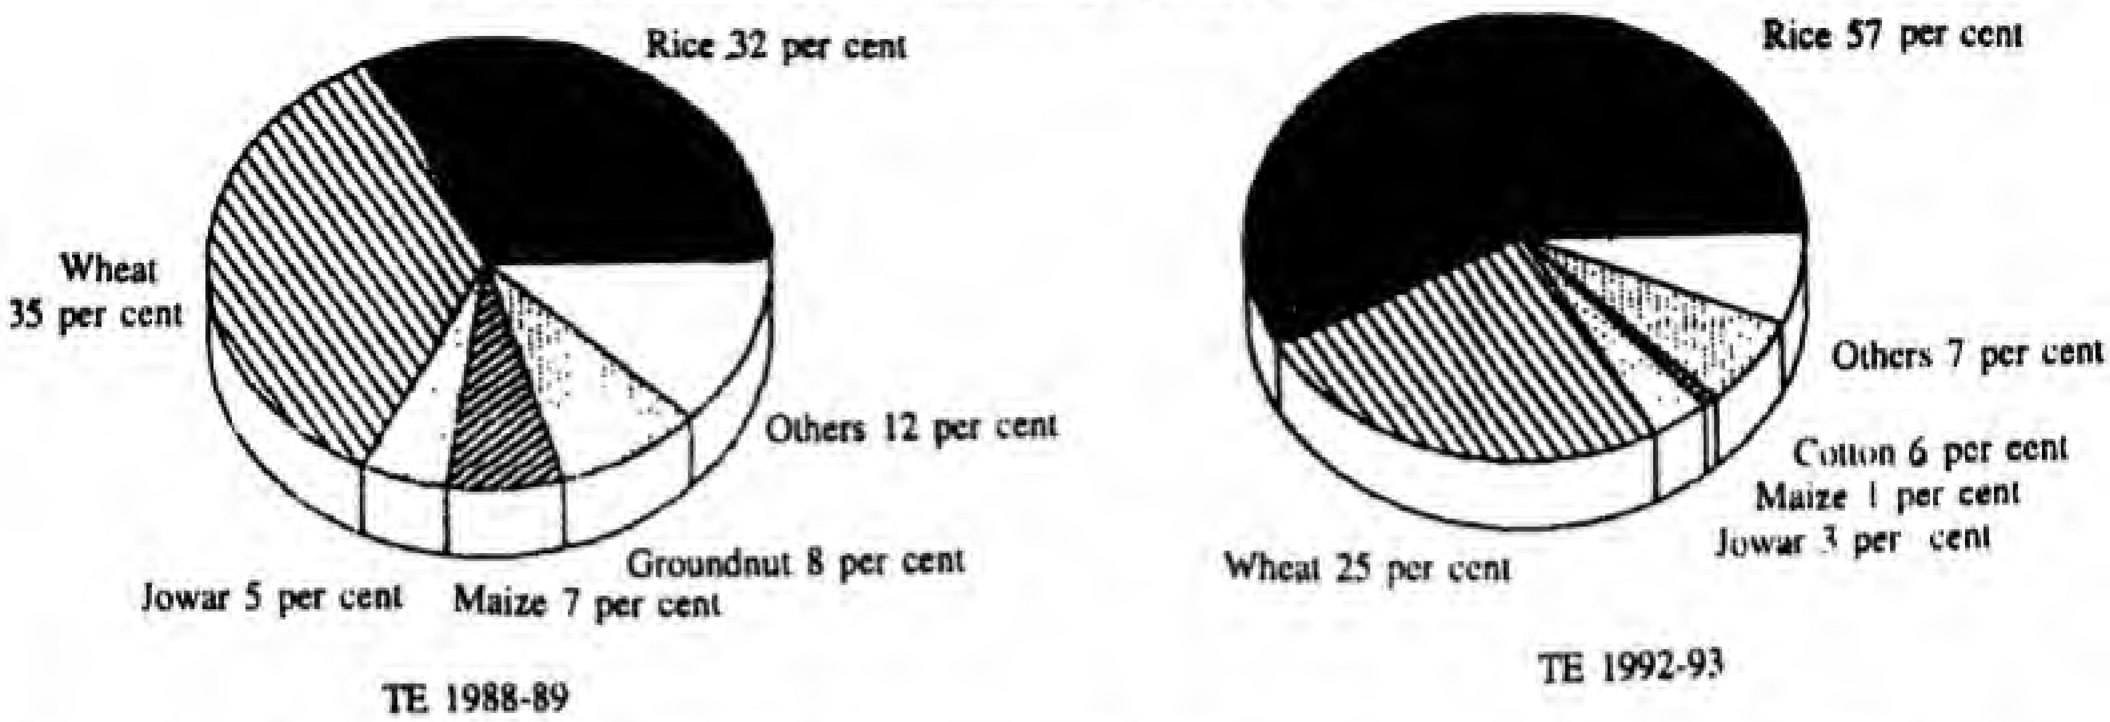
The implementation of these measures will not have any adverse effect on Indian agriculture during the implementation period.[7] This is because imports of various agricultural commodities in India are subjected to mainly quantitative restrictions for balance of payment reasons. The special provisions of agreement allow any country to maintain import restrictions up to the end of the implementation period.[8] In any case, even if India does not have BOP cover, that does not mean that India will have to compulsorily import 3 per cent of its domestic consumption.[9] What all it means is that India will allow the imports of these commodities at low levels of tariff. Providing access to the domestic market does not mean that there will be a flood of imports because, (i) if the prices of agricultural products in the domestic market are below their international levels, imports will not be able to compete with the domestically produced products. This is precisely what is true with most of the agricultural commodities in India (with a notable exception of edible oils), and (ii) if the country from where the product is being imported is indulging in dumping, special provisions of the agreement allow us to impose additional tariff barriers as indicated earlier.

This can be explained with the help of import data for the triennium ending 1988-89 (base period), which reveals that except for edible oils, where imports constituted 28.66 per cent of domestic consumption,[10] imports of other agricultural commodities were less than 3 per cent of their total domestic consumption. For instance, imports of rice, wheat and cotton—three major commodities were 0.38 per cent, 1.47 per cent and 0.92 per cent of their total domestic consumption during the base period (triennium ending 1988-89). This clearly shows that there is no adverse impact of the commitment of market access on Indian agriculture. Even in case of edible oils, special provisions allow India to maintain present restrictions till the end of the implementation period, which is 10 years for the reasons explained above and also for balance of payment reasons.[11]

II
Aggregate Measure of Support

Aggregate measure of support (AMS) is the annual aggregate value of market price support, non-exempt direct payments and any other subsidy not exempted from the reduction commitment expressed in

FIGURE: RELATIVE SHARES OF DIFFERENT COMMODITIES IN TOTAL PRODUCT SPECIFIC NEGATIVE SUPPORT



monetary terms. Thus, to estimate AMS for Indian agriculture, first one works out the level of support for each basic product (like rice, wheat, cotton and so on) that it obtains through (a) market price support; (b) non-exempt direct payments, and (c) other subsidies not exempted from reduction commitments. Support which falls under the purview of non-product specific (like subsidies on various inputs) is totalled into one non-product specific AMS expressed in monetary terms. Policies which have been excluded from reduction commitments are government spending on research, disease control, infrastructure and food security. These also include structural adjustment assistance, direct payments under environmental programmes and regional assistance programmes.[12]

In product specific AMS, the market price support is to be calculated using the gap between a fixed external reference price (fob unit value in a net exporting country and cif unit value in a net importing country) and administered price (domestic support price) multiplied by quantity eligible to receive the administered price. There is not enough clarity in the Final Act whether the quantity eligible to receive administered price is the total quantity of production, or only the marketed surplus.[13] The reference price shall be based on the years 1986-87 to 1988-89. The external reference price needs to be adjusted for quality differences as necessary in order to make it comparable with the domestically produced product.

Non-exempt direct payments are to be computed by using the gap between external reference price and administered price or by using budgetary outlays. Input subsidies and other policies like marketing cost reduction measures are to be determined by using budgetary outlays. However, if budgetary outlays do not reflect the full extent of subsidy, the subsidy has to be worked out by using the gap between the subsidised price of input in question and a representative market price multiplied by the quantity used of that input.

If the product specific and non-product specific AMS does not exceed 10 per cent of the total value of agricultural product in case of a developing country (5 per cent in case of a developed country), the country is not required to reduce the product specific and non-product specific support. However, if the AMS exceeds 10 per cent of the total value of agricultural production, it is required to be reduced by 13.3 per cent in case of a developing country (20 per cent in case of a developed country) of the value that does not qualify for exemption during the implementation period. The least developed countries have been exempted from these reductions.

India has basically two types of support operations for farmers. First, market price support, which is in the form of minimum support prices announced by the government for different commodities, based on the recommendations of the Commission for Agricultural Costs and Prices (CACP). Second, the support in the form of input subsidies which are on inputs like fertilisers, irrigation, electricity, credit and seeds.

The third type of support which falls under the head of non-exempt direct payments is not given to farmers in India.

The estimates based on support prices reveal that product specific AMS for India (for 17 products out of 22 total products for

TABLE 1. PRODUCT SPECIFIC AND NON-PRODUCT SPECIFIC AGGREGATE MEASURE OF SUPPORT (TE 1988-89 AND TE 1992-93)

(Rs billion)

Support Type	TE 1988-89	TE 1992-93
Product Specific AMS		
(a) Based on support prices	-242.25 (-27.74)	-427.89 (-26.33)
(b) Based on farm harvest prices	-151.03 (-17.29)	-295.21 (-18.17)
Non-product Specific AMS	45.77 (5.24)	86.45 (5.32)
(i) Fertiliser subsidy	10.21	24.98
(ii) Irrigation subsidy	17.93	17.15
(iii) Electricity subsidy	15.81	41.54
(iv) Credit subsidy	1.00	1.96
(v) Subsidy on seeds	0.82	0.82
Total product specific and non-product specific AMS		
(a) Based on support prices	-196.48 (-22.50)	-341.44 (-21.01)
(b) Based on farm harvest prices	-105.26 (-12.05)	208.76 (-22.85)

Notes Figures in parentheses are percentages to the total value of agricultural production (excluding forestry and fishery).

The 17 crops included in product specific AMS are rice, wheat, jowar, bajra, barley, gram, tur, urad, moong, groundnut, rapeseed and mustard, soyabean (yellow and black), cotton, jute, tobacco and sugarcane.

In non-product specific AMS, the programmes included are fertiliser subsidy, electricity subsidy, irrigation subsidy, credit subsidy and seed subsidy.

According to the Ministry of Commerce product specific AMS during TE 1988-89 is Rs (-)244.42 billion. The problems with their estimate have been discussed in endnotes 10, 11, 13, 14, and 15 at relevant places.

which India maintains market support programmes) works out to be negative to the tune of (-)Rs 242 billion. This forms (-)27.74 per cent of total value of agricultural production (excluding forestry and fishery).[14,15] Non-product specific AMS works out to be Rs 46 billion, 5.24 per cent of total value of agricultural production (Table 1).[16] By adding these two one gets total AMS which stands at (-)Rs 196 billion, which forms (-)22.50 per cent of the value of agricultural output during the base period 1986-87 to 1988-89. This indicates the massive amount of 'taxation' that is inflicted on Indian agriculture, which is contrary to the general impression of huge subsidies which flow to this sector.

This negative support (or net taxation) is due to the fact that prices of different crops are fixed by the government below their international levels (barring rapeseed-mustard and sugarcane). This is evident from the data presented in Table 2, which shows that in terms of per unit output, the highest average negative support is for barley, which was found to be (-)200.30 per cent during the base period.[17] The next highest per unit support (in negative) is found in case of jute, which amounted to (-)134.92 per cent during triennium ending 1988-89. Other product groups with more than 100 per cent of negative support per unit of output during the same period are maize (-127.26 per cent), sorghum (-119.78 per cent), tobacco (-115.57 per cent) and wheat (-111.98 per cent) respectively. The only product group receiving positive support was sugarcane in which case the subsidy was found to be 14.82 per cent of output.[18,19]

Because of these negative support figures per unit of output, the product specific aggregate measure of support turns out to be negative, i e, price difference multiplied by total quantity of production. The highest negative product specific AMS was found for wheat which totalled Rs (-)85.74 billion. Wheat was closely followed by rice in which case the product specific AMS turned out to be Rs (-)77.23 billion. These two crops were followed by groundnut (-20.49 billion), maize (-16.53 billion) and jowar (-12.52 billion) respectively in that order. The lowest negative product specific aggregate measure of support amounting to Rs (-)16.5 billion was obtained for soyabean. However, in case of sugarcane as explained earlier, the product specific AMS turned out to be Rs 2.41 billion during the base period.

These numbers clearly indicate that India is not required to reduce its support levels as the product specific and non-product specific AMS works out to be (-)22.5 per cent of the total value of agricultural output.[20] In fact over the years, the AMS has increased in negative and stood at Rs (-)341.44 billion during TE 1992-93. This massive increase of 73.77 per cent in absolute value of AMS seems to be the effect of depreciation of rupee against major currencies of the world during the last three years as also in relative prices of different commodities. During this triennium, the highest product specific AMS in negative was found in case of rice which amounted to Rs (-)245.98 billion. After rice followed wheat and cotton with product specific AMS totalling Rs (-)107.59 billion and Rs (-)27.66 billion respectively. During this period another commodity in addition to sugarcane which has positive product specific AMS is rapeseed and mustard, where the product specific AMS is found to be Rs 6.09 billion.[21] The relative shares of major crops in total product specific negative support during triennium ending 1988-89 and triennium ending 1992-93 are depicted in the Figure.

The calculations of product specific AMS for different commodities at farm harvest prices[22] are also somewhat in line with those obtained on the basis of support prices (Table 3), but the degree surely differs. The farm harvest prices have been used as an alternative set of prices because support prices have no meaning in the case of those commodities where no support operations are carried on by the government. Besides, farm harvest prices are supposed to be close to the prices which farmers get for their produce.

Though the product specific AMS for 17 commodities was found to be Rs (-)151.03 billion, the extent of taxation (both product specific and non-product specific was still quite high, i e, (-)12.05 per cent of the total value of agricultural output during 1986-87 to 1988-89 base period.[23] There were only three commodities, namely, gram, tur and sugarcane which showed positive product specific AMS. Similar trends were observed in triennium ending 1992-93, when the total product specific and non-product specific AMS turned out to be Rs (-)208.77 billion, which was found to be (-)12.85 per cent of the total value of agricultural output during this period. The product range with negative AMS narrowed to 8 commodities and with positive support expanded to nine commodities.[24] But three major crops, i e, rice, wheat and cotton which accounted for 55.52 per cent of total value of agricultural output in 1980s [Bhalla and Tyagi 1989] had negative AMS amounting to Rs (-)187.33 billion, Rs (-)117.53 billion and Rs (-)26.25 billion respectively. Crops with highest positive product specific AMS were groundnut and rapeseed and mustard wherein the AMS was Rs 15.44 billion and Rs 13.09 billion respectively.

The above mentioned trends of domestic support in India are contrary to those found in developed countries of the world. Almost all developed countries provide positive support to their cultivators ranging from as high as 72 per cent in case of Japan, 37 per cent in case of European Community and 26 per cent in case of USA [Gulati and Sharma 1992].[25] This is in sharp contrast to India which imposes net tax on its cultivators.

III
Export Competition

In the area of export competition, GATT agreement calls for reducing direct export subsidies to a level of 36 per cent below 1986-88 level in case of developed countries

Table 2: Extent of Support Per Unit of Output Based on Support Prices

Crop	TE 1988-89 Administered Price (Rs/MT)	TE 1988-89 Reference Price (Rs/MT)	TE 1988-89 Product Specific Support (Per Cent)	TE 1992-93 Administered Price (Rs/MT)	TE 1992-93 Reference Price (Rs/MT)	TE 1992-93 Product Specific Support (Per Cent)
Rice	2280.00	3520.00	–54.39	3507.46	6834.70	–94.86
Wheat	1670.00	3540.00	–111.98	2383.33	4380.30	–83.79

over a period of six years. The quantity of subsidised exports by the developed countries is to be reduced by 21 per cent during the same period. In case of developing countries direct export subsidies are to be reduced by 24 per cent and the quantity of subsidised exports is to be reduced by 14 per cent. These reductions in case of developing countries are to be carried out over a period of 10 years as against six years in case of developed countries. The least developed countries have been exempted from these reduction commitments. Export subsidies included in reduction commitments are direct subsidies paid by the government or any other agency, including payments in kind; payments that are made from the proceeds of levy imposed on agricultural products; subsidies given to reduce the costs of marketing including internal handling, processing, international transport and freight subsidy on export shipments.

In order to see the impact of these commitments on agricultural exports from India, we have to look at the nature and extent of these subsidies. Indian exporters of agricultural commodities do not get direct export subsidy. The only subsidies available to exporters of agricultural commodities are in the form of: (i) exemption of profits from export sales from the income tax, and (ii) subsidies on costs of freight on export shipments of certain products like fruits, vegetables and floricultural products.

Since these payments by developing countries are exempt from the reduction commitments during the implementation period, the commitments mentioned above will not have adverse impact on agricultural exports from India. In order to encourage the exports of agricultural products these subsidies can be continued for the time being. Once the export supplies become self sustaining during the adjustment period, these can be withdrawn.

It is well documented in literature that most of the developed countries operate export subsidy programmes to enhance their exports. According to one estimate [GATT Secretariat 1993] developed country export subsidies amounted to $ 16.4 billion during the base period. These countries would be required to gradually reduce their export assistance programmes. This will open up new markets for countries like India, which are efficient producers of agricultural products.[26] Therefore, reductions in export subsidies and subsidised exports of developed countries will have greater implications for developing country exports. Countries like India would benefit not only from improved market access opportunities in the developed and developing countries, but also from the reduction of subsidised exports and trade distorting production incentives in developed countries.

IV
Post-GATT Scenario

Having looked at the commitments under GATT in three major areas of market access, domestic support and export competition, the questions that emerge are: (i) what is likely to be the impact of these commitments on world prices and trade of agricultural commodities, and (ii) whether India will be better off once these commitments are fulfilled by the developed countries.

Although, projecting future is a tricky exercise as no one is yet sure of the way how developed countries are going to bring down their AMS, as it is no more commodity specific. Thus, which commodities will bear the burden of adjustment remains speculative. It would be strongly influenced by commodity specific lobbies in developed countries. Nevertheless, one can venture speculating the expected outcome of post-GATT scenario through the judgment of experts in the field. On theoretical grounds one would expect that reduced support levels and rationalisation of trade barriers will increase production and export of various commodities in those countries which have comparative advantage in the production of agricultural commodities. Similarly the reduction in import barriers will reduce consumer prices in those countries where the tariff barriers are very high, which will generate strong demand and will push up imports. Some empirical modelling exercises show that international prices will rise and so will the trade volumes.[27] But the estimates of change in prices and trade vary from study to study. Even if the world prices remain constant, it is clear from the above analysis that prices of various agricultural

Table 4: Prices of Various Agricultural Commodities in Relation to Wheat (TE 1992-93)

Crop	India (Wheat = 100)	World (Wheat = 100)
Wheat	100.00	100.00
Rice	147.17	199.43
Maize	88.81	74.68
Sorghum	87.41	74.41
Cotton $	355.25	372.07
Groundnut	248.55	189.64
Soyabean	191.61	177.04
Rapeseed and Mustard	283.92	150.38

Notes: $ = Kapas

In case of groundnut, the ratios are for the year 1989, as the international prices for later years are not available.

Prices in India are support prices.

World prices have been taken from *FAO Quarterly*. The details of these prices are given below. The world prices are for the following varieties:

Wheat = US HRW No 2 variety, fob US Gulf; Rice = Thai rice 5 per cent broken variety, fob Bangkok; Maize = US No 2 (yellow) variety, fob US Gulf; Sorghum = US No 2 (yellow) variety, fob US Gulf; Cotton = SM 1-1/16 US Memphis variety, cif, Liverpool; Soyabean = Soyabean of US origin, cif, Rotterdam; Rapeseed = Canadian 40 per cent, cif, NW Europe; Groundnut = Any origin, cif, Europe.

Table 3: Extent of Support Per Unit of Output Based on Farm Harvest Prices

Crop	TE 1988-89			TE 1992-93		
	Farm Harvest Price (Rs/MT)	Reference Price (Rs/MT)	Product Specific Support (Per Cent)	Farm Harvest Price (Rs/MT)	Reference Price (Rs/MT)	Product Specific Support (Per Cent)
Rice	2828.14	3520.00	–24.46	4302.70	6834.70	–58.85
Wheat	2024.80	3540.00	–74.83	2947.50	4380.30	–48.61
Maize	1870.40	3121.00	–66.86	2818.10	2525.00	10.40
Sorghum	1736.81	2945.00	–69.56	3103.30	3427.20	–10.44

commodities in India are well below their international levels. India has comparative advantage in agriculture because of its diverse agro-climatic conditions (which are conducive for a variety of crops almost round the year). There is no reason to believe that exports of this sector will not grow with more open world trade policy environment: there are large differences between potential and actual yields, the import intensity of this sector is low compared to other sectors of the economy and labour costs are reasonably low compared to other countries. Our understanding of the situation is that India is likely to gain more from its own policy of liberalising agricultural trade than what may be expected from GATT provisions. The recent trends in exports reinforce these arguments. In fact agriculture has turned out to be a star performer in terms of exports. Agricultural exports increased by 38 per cent in dollar terms during the first half of the year. With the tremendous increase in exports, the export basket of agricultural products has also diversified in the recent years. From tea and mate, which formed nearly 40 per cent of agricultural exports from India in 1960s, exports have diversified to cashew kernels and spices to fish and fish preparations, oil cakes, rice, fruits and vegetables and processed foods.

In the past, agricultural exports from India did not outshine because of: (i) over valued exchange rate of rupee against major currencies of the world; (ii) the external trade in most of the agricultural commodities was and in many cases still is subjected to various controls mainly non-tariff barriers like export quotas, canalisation and minimum export prices (MEPs); and (iii) *ad hocism* in the export policy, which means export markets are 'residual' markets, i e, they are approached only in case of country has surplus.[28]

These pervasive controls along with treating export markets as residuals lowered the returns available to the producers. It resulted in diverting the resources away from export competitive crops. All these factors taken together have acted as deterrents and resulted in the lost trade advantage that India has in the area of agriculture. These irritants have outlived their purpose and must be done away with fairly quickly, if India has to take advantage of new post-GATT scenario.[29] The new exim policy of the government of India does reflect some of the concerns; however, much more remains to be done. First, ministry of commerce should set up an expert group to identify the commodities in which India is likely to gain in post-GATT scenario. This is important because the total cultivable area is almost limited and changes in price ratios will change cropping patterns in favour of those crops which have relative comparative advantage. Second, identify the likely change that the export basket of agricultural commodities is likely to witness, and accordingly prepare the country to improve its competitive edge by working on the fundamentals of various links from production in the farms to exporting in the ships.

In order to find out the precise nature of such shifts in cropping patterns and changes in exports, one may build a large model (linear programming or general equilibrium model) but a very rough and crude idea of this can be had from the relative price ratios prevailing in the domestic market and in the international market. Price ratios of various agricultural commodities in relation to wheat (assuming wheat price equal to 100) in India and the world are given in Table 4. A perusal of data presented in table reveals that area under oilseeds is likely to contract, as their relative prices are much lower in the international market than those in the domestic market. This is particularly true for rapeseed-mustard and groundnut.[30] The extent of these variations differs and varies from 31.06 per cent in case of groundnut to 88.80 per cent in case of rapeseed and mustard. Similar changes will occur in case of coarse cereals also, but the impact is likely to be marginal compared to oilseeds. On the other hand, area under fine cereals, rice, wheat and fibre crop, cotton, is likely to expand and they may emerge as important export items along with fish and fish preparations. Thus, the share of oilcakes (particularly non-soya) in agro exports may gradually come down with import liberalisation of edible oils. Our research on the future agro-export basket of the country also reveals that it is likely to be dominated by fish and fish preparations, rice, wheat, tea, tobacco, fruits and vegetables and their processed items. Our analysis of major cereals, fruits, vegetables and their processed items reveals that India has high to moderate competitive advantage in most of these commodities [NCAER 1994]. This calls for making additional efforts in terms of devising appropriate policies for these future export items in which the country has competitive advantage.

Therefore, if the exports of agricultural commodities have to increase, the time is ripe to abolish all export controls and regulations like canalisation, export quotas and minimum export prices. Next on agenda should be infrastructural developments in terms of bulk storage and handling facilities at rail heads and sea ports for cereals, fast track facilities, preferably dedicated cargo terminals for perishable commodities (fruits, vegetables and their processed items) at major air-sea ports. Last but not the least, long-term investments in research and extension in yield and quality, eco-friendly production of fruits and vegetables and their packaging material are crucially important for taking advantage from the post-GATT scenario, and sustain higher growth in agro-exports.[31]

Summary and Conclusions

The impact of GATT commitments in agriculture which fall under three main categories, i e, market access, domestic support and export competition is explored in this paper. The analysis reveals that India stands to gain rather than lose from trade liberalisation by the GATT members. The domestic support levels in India are negative in most of the agricultural commodities studied here, which is in sharp contrast to the support levels prevailing in developed countries of the world. Almost all developed countries provide positive support to their cultivators and their support levels are quite high (generally more than 10 per cent of the total value of agricultural output). In India the product specific and non-product specific AMS (for 17 products out of 22 total products for which India maintains market support programmes) works out to be negative, i e, (-)Rs 196 billion, which forms (-)22.50 per cent of the value of agricultural output during the base period 1986-87 to 1988-89. This indicates the massive amount of 'taxation' that the Indian agriculture, in reality, is subjected to, contrary to the general impression of huge input subsidies which flow to this sector. In fact over the years, this negative support has increased in absolute amount to Rs (-)341.45 billion during TE 1992-93, but in percentage terms, has slightly come down to (-)21 per cent.

A few studies that have been carried out in the recent past indicate, that international prices of agricultural commodities will rise and so will their production and trade volumes. Also the variability in world prices will reduce. Though the increase may be a modest one, but it can be said with reasonable degree of certainity that reduced support levels and rationalisation of trade barriers will increase production and export of various commodities in countries like India, which have comparative advantage in the production of agricultural commodities. Diverse agro-climatic conditions in India and the existing differentials in actual and potential yields, all augur well for exports of agricultural commodities. To cash on the trade opportunities which will emerge from the post GATT scenario, India will have to change its export strategy of treating export markets as residuals. In addition to this various stringent measures which act as irritants like export quotas, canalisation and minimum export prices must be done away with completely. The analysis also reveals that future export items will be fish and fish preparations, cereals like rice and wheat, tea and tobacco, fruits, vegetables and their processed items. This calls for making additional efforts in terms of devising

appropriate policies for these future export items in which the country has comparative advantage.

Notes

1 In the first round, the 23 countries that founded GATT exchanged tariff cuts for 45,000 products worth $ 10 billion of trade on annual basis.

2 The second round was held at Annecy (France) in 1949 in which another 10 countries joined and customs duties were reduced for another 5,000 items. Third round was held in Torquay (Britain) in 1950-51 and involved 38 countries. Fourth and fifth rounds were held in Geneva (Switzerland) in 1955-56 and 1960-62 respectively. The sixth round which is known as the "Kennedy round" was also initiated in Geneva in 1964 and was completed in 1967. In this round more than 50 countries accounting for 75 per cent of world trade participated. Seventh round of GATT negotiations was started in 1973 in Tokyo (Japan) but ended in Geneva in 1979. In this round 99 countries participated in trade negotiations.

3 Agriculture did appear on GATT agenda thrice before this round, but the focus was very narrow.

4 Another area of concern in agriculture which has created fears in the minds of people is the impact of trade related intellectual property rights of farmers and plant breeders. This we feel is basically the area of plant breeders and they should be the right persons to comment on this issue. However, our understanding of this issue is that in *sui generis* system of plant protection, the proposed legislation offers farmers to save, use, exchange and share seeds. The only thing which sui *generis* system of intellectual property rights prohibits is the large-scale multiplication and selling of the seed purchased from companies.

5 The level of tariff which will result from this process is not clearly defined in the Draft Final Agreement. Logically, one would think that the level of tariff would be equal to the difference in the domestic and world prices during the base period, 1986-88. But actually, it is not so. GATT secretariate has asked its member countries to propose their respective tariff rates on various commodity groups. India, e g, has proposed 100 per cent tariff on agricultural commodities, 150 per cent on processed agro-commodities and 300 per cent on edible oils, despite the fact that, on the whole Indian agriculture's AMS is negative.

6 The additional duties will be set according to the difference between cif import price and the trigger price. The trigger price shall be equal to 125 per cent, 110 per cent, 105 per cent of the average cif import value of the preceding three years, when the market access opportunities are less than or equal to 10 per cent, between 10 per cent and 30 per cent and above 30 per cent respectively. [For details on how additional duties would be determined, see World Trade Centre, 1994].

7 Countries like Japan, South Korea and European Community, which have very high tariff barriers and use border measures like variable levies will be required to provide greater market access to other countries.

8 The conditions under which the restrictions can be maintained are (i) imports constitute less than 3 per cent of the domestic consumption of the particular product during 1986-88, (ii) no export subsidies have been provided for the particular product since 1986, (iii) effective production restricting measures are applied to this particular product, and (iv) minimum access opportunities are provided.

9 This apprehension has been expressed in Thomas et al (1994).

10 Domestic consumption has been equated with net availability. Net availability includes net production (gross production minus quantity kept for seed, feed and wastage), imports and changes in stocks.

11 Government of India has put imports of palmolein oil under OGL (Open General Licence) at 65 per cent import duty (*The Economic Times*, April 19, 1994). NDDB and STC, however, have been allowed to import at 20 per cent import duty.

12 Even input subsidies available to low income or resource poor producers (having operational holdings below 10 hectare) in developing countries are exempt from domestic support commitments (WTC, 1993, page 29 and GOI, Ministry of Commerce). If that is true then almost 80 per cent of the input subsidies will qualify for exemption, because in India operational holdings of 10 hectares or below account for 79.5 per cent of agricultural land.

13 It is worth noting that in 1991, the government estimated AMS for Indian agriculture on the basis of marketed surplus of relevant commodities, while in 1994 the reply given by Indian government to GATT secretariate included production as the relevant quantity.

14 This is a bit different from the estimate worked out by the Ministry of Commerce. According to their calculations the product specific aggregate measure of support is Rs (–)244.42 billion. This is because of the methodological and computational problems which remain in the estimates of the Ministry of Commerce. These have been explained in the latter part of the text or in endnotes.

15 Ministry's estimate reveals that product specific support forms (-)17.40 per cent of the total value of agricultural production, whereas our estimates show that it is (-)27.74 per cent of total value of agricultural production. It seems they have included animal husbandry and forestry in total value of agricultural production, while support on these components of agriculture has not been included. We have corrected for this and taken crop value only as representing agriculture.

16 Input subsidies for triennium ending 1992-93 have been worked out as follows:

(i) Fertiliser subsidy has been taken as 50 per cent of the amount shown in government documents, the rest is deemed to be going either to the fertiliser industry or to the feedstock agencies [Gulati, 1990].

(ii) Irrigation subsidy represents the losses made on working expenses of major and medium and minor irrigation schemes. It does not include the subsidy on capital investment made in these schemes [Gulati, 1994 and Gulati and Sharma 1994].

(iii) Electricity subsidy has been taken from Gulati and Sharma (1994).

(iv) Subsidy on farm credit represents only the interest rate subsidy and does not include the loans written-off.

(v) Subsidy on seeds has been taken from the publications of government of India.

17 According to the ministry, it is (–)190.96 per cent. This is again because of the wrong information used for the selected years on prices and production. In their estimates they have used price information for 1987-88, 1988-89 and 1989-90. Actually the price should be for 1986-87, 1987-88 and 1988-89 and corresponding production figures should be for the crop years 1985-86 become available for sale in 1986-87 and so on. Same is true for wheat, gram and rapeseed and mustard, which are all rabi crops.

18 According to the calculations done by the Ministry of Commerce, tobacco also received positive support. But, there appears to be a slip in their estimates. It seems they have used import parity price while comparing support price with external reference price. However, India being net exporter of tobacco, it is the export parity price which should be compared with the support price and not the import parity price.

19 Another disagreement between our numbers and the numbers worked out by the ministry appears to be in the case of cotton. In this case, ministry's estimates seem to have compared kapas (seed cotton) prices and the prices of lint. Actually, it is the price of lint which should be compared with import parity price of lint. The like should be compared with like only.

20 India is not required to reduce its support levels under the GATT agreement. However, input subsidies may become unsustainable over time due to budget constraints. The rising burden of subsidies is affecting investment in agriculture. Reduced investment in the agricultural sector has been an area of concern during the 80s. It is believed that this is largely due to the higher budgetary allocations for meeting the expenditure on subsidies.

21 Our feeling is that one more commodity which received positive support during this period could be groundnut. Since, the prices of groundnut in the international market for this period are not available, we have been forced to use 1989 prices due to paucity of information. Due to this reason the AMS turns out to be negative.

22 Farm harvest prices are the weighted farm harvest prices. The weights being shares in total production of a crop in those states for which farm harvest prices are available.

23 The year 1987-88 was a drought year, therefore, farm harvest prices of various crops had abnormally gone up. Probably due to this reason there is such a large difference in these esti-mates at support prices and farm harvest prices.

24 1991-92 was again a bad year for coarse cereals. The production of coarse cereals was quite low and because of this reason their prices were very high compared to normal years.

25 These estimates are based on Producer Subsidy Equivalents as estimated by USDA for the period 1981-82 to 1987-88. We do not have access to their AMS for the period 1986-87 to 1988-89, but it is expected the levels of AMS are also quite high.

26 Preliminary estimates by USDA reveal that reductions in export subsidies by developed countries will open up world wheat market for developing countries by 15 to 20 million tonnes.

27 Some studies based on partial and general equilibrium modelling exercises indicate that international prices of agricultural commodities will rise and so will their trade volumes. Also the variability in world prices will reduce. A sample of these models include (i) Tyers and Anderson Model, (ii) SWOPSIM (Static World Policy Simulation Model), US Department of Agriculture, (iii) IIASA (International Institute of Applied Systems Analysis) Model and (iv) OECD (Organisation of Economic Co-operation and Development) Model. In a more recent work Brandao and Martin (1993) estimated that international prices increase, but by not very much, from baseline levels (1985-87), e g, wheat +1 per cent to + b6 per cent; rice -5 per cent to +2 per cent; coarse grains +2 per cent to +4 per cent; sugar +6 per cent to +12 per cent, oilseeds and pulses +1 to +5 per cent and cotton +1 to +4 per cent. These models vary in their commodity coverage and incorporate different sets of policies and because of these reasons the results of these models also differ, depending upon the assumptions and information they use. But, the results are in line with theoretical expectations of trade liberalisation measures.

28 Cotton is a good example of this type of export policy [see Gulati and Sharma, 1994].

29 Some apprehensions have been expressed about the likely impact of such measures on food security of the country [Nayyar and Sen 1994]. These apprehensions do not appear to be valid in the present day context, because country has attained self sufficiency in foodgrains production. An inter-ministerial working group set up by the Ministry of Agriculture has found that the current level of foodgrains production exceeds the normative requirements of the population by about 10 per cent,[GOI 1994]. The group is of the opinion that 180 million tonnes of foodgrains are adequate to feed the estimated population of one billion in 2000 AD. The report further adds that undernutrition is simply a matter of poors' inadequate access to food.

30 Among oilseeds soyabean perhaps can still survive the impact of changed scenario, because it is more a protein or an oilcake crop than an oil crop. Since the demand for oilcakes is expected to increase, both on the international as well as the domestic market, it is quite likely that area devoted to this crop will not decrease.

31 For commodity specific strategies that India should undertake, see NCAER, 1994.

'The Kingdome of Darknesse' or the Problem of Culture

G P Deshpande

Both empirical and deterministic approaches to Indian culture have been destructive. They have assumed that there is no plurality within Hinduism or within Indian Islam. Indian culture is an organic and historically determined unity which has escaped us over a period of time almost parallelly and simultaneously with slow but hopefully not yet certain destruction of India.

CLOSE to half a century ago Maurice Dobb wrote an essay on 'capitalism' which has become quite a classic. The opening sentences of the essay read as follows:

> It is perhaps not altogether surprising that the term Capitalism... should have been used so variously, and that there should have been no common measure of agreement in its use. What is more remarkable is that in economic theory, as this has been expounded by the traditional schools, the term should have appeared so rarely, if at all.

Almost the same words can be used about 'Bharatiya sanskriti' (Indian culture). The traditional schools of thought in India do not use the term at all. There was a famous book by Sane Guruji of the same name.[1] But even that book was more an attempt to refute the distortions of Hinduism and the Indian culture that the Hindu nationalists were trying to popularise in the late 1930s and early 1940s. Thus the Hindu nationalist's, Savarkar's, view of Indian culture and the view of a Gandhian like the late Sane were as different from each other as different can be. Perhaps Savarkar does not offer the best comparative paradigm. There would be any number of Hindu nationalists who would have very little to do with Savarkar's world-view. Their favourite would be Vivekanand.[2] One can go on citing examples of this kind. The point is that what is Bharatiya sanskriti and more particularly what meaning and significance one attributes to the term Hindu is scarcely an easy question to answer. This is not to suggest that there is no such thing as Hinduism or Hindu. To be sure there is except that it is not easy to describe, let alone define it.

This is further complicated by the fact that in most Indian languages there does not exist a term for culture which predates the colonial period. Even the word sanskriti is a coinage and that too of a fairly recently vintage. In Bengali the term 'krishti' (like bildung in German) was popular for a while and as Suneeti Kumar Chatterjee's account tells us that it was at Tagore's initiative that the term sanskriti was preferred and came to stay in Bengali as the standard word for culture. In many languages (Marathi for example) no clear distinction is made between culture and civilisation in terms of the use of separate words for both. More often than not sanskriti serves the purpose and it is the context which makes it clear if culture or civilisation is referred to.

I

It is obvious that this does and cannot mean that there was no culture. After all even in English the usage is not very old. The Oxford English Dictionary traces the word to year 1483. But it was then employed to mean 'worship; reverential homage' and so on. The first major work in which the term culture in its modern sense is employed is Hobbes' *Leviathan* (1651). Hobbes talks there of 'the education of children' being 'a culture of their minds'. This obviously comes from the Latin 'cultura' which meant cultivation, tending in Christian authors. Hobbes, however, takes the notion a few steps forward. The point is that culture as a secular category emerges even in Europe only in the 17th century. This has to be also understood in conjunction with Kantian and Hegelian thought. Kant through his three critiques made it easy to establish aesthetics and therefore culture as an autonomous category. On the other hand with Hegel, as Marcuse has pointed out, "... history no longer remained a process confined to one region...".[3] To be sure, Marcuse is talking here of the regions of spirit and of nature (in his discussion of Dilthey's analysis of Hegel) but the statement is true also in a more primary sense inasmuch as with Hegel 'History' becomes a universal category going beyond regions. In short with Hegel we have 'world history' for the first time. With Hegel history emerges as a singular noun 'History' takes the place of histories.

It would seem that the process of growing consciousness of culture has taken a different, almost opposite course. In pre-colonial times as we have seen culture as a term did not exist in most Indian languages. Everything was 'dharma'. It has become a cliche in contemporary discussions that dharma is not religion. If we had pre-colonial India in view, it would be right to argue that dharma was inclusive of both 'ritualistic' or 'religious' and secular elements. Thus 'yajana' and 'yajana' (to perform rituals like 'puja' and 'yajna' and to officiate at these rituals as a priest) were the dharma of a brahmin. But so were 'adhyayana' and 'adhyapana' (study and teaching). An actor had his dharma (so much so that in our times the terms 'karma' and dharma have been revived in the Indian language discussions of theatre. A late 19th century or early 20th century theatre hardly ever used these terms). This was no less true of the non-Hindus. Islam here had a distinct Indian character and it did not fight shy of accommodating elements from the other metaphysical or even secular traditions. This is particularly so in the fields of culture more specifically in music, dance and literature.

Sometime in the 19th century the situation clearly starts changing. The pace and timing of change have varied in different parts of India. But its overall thrust has been unmistakable. To begin with dharma now starts acquiring the characteristics of religion as the term is normally understood. The transformation is still not complete. But the signs of change are also clearly visible. 'Hinduism' not only emerges as a fairly definable category; it also gets semitised in the process. With or without their knowledge our leading figures of the time try to turn the religious system of India into what could be described in Weberian terminology as 'rational', i e, disciplined or organised religion. One sees this change coming across the board as it were. Indian Islam is increasingly projected as totally unrelated to the mass of 'Hindus' around it. It would not be very wrong to say that the Indian elite (both Hindu and Muslim) makes a crucial shift from one civilisation to two nationalities. The Indian Marxists used this terminology much later. But their erroneous use of this theory to understand the Hindu-Muslim problem demonstrated the divide that the elite was

imposing upon itself over a century. The masses were dragged into it, continue being dragged into it. In backward societies (in particular) this is inevitable. But they did not quite share this perception. This is demonstrated by the poor response that the Hindumahasabha and the Muslim League as political parties generally evoked among the follower of the respective faiths. The masses suffered the elite desire to destroy their culture silently. Perhaps a better way of putting it is that they were reluctant victims of politicisation of their faiths by the elites both Hindu and Muslim.

II

It is interesting to see the manner in which this politicisation took place and the general cultural significance of that politicisation. I will limit my comments to Hinduism because that's an area I know fairly well. But it would be a mistake to assume that the phenomenon being described here was limited to the Hindus alone. Colonialism and the early Indology planted several myths in the Indian mind. One of them was the belief that Aryans and Dravidians were in fact races. The reality is that the terms can be conveniently used for classification of Indian languages. That a given group of languages presupposes a race speaking those languages has no scientific basis whatsoever. At any rate whatever justification this belief might have had in the 19th century, today it has to be rejected as baseless and incorrect. There is no race called the Aryan race. This is also true of the so-called Dravidian race. There are Dravidian languages. There is group of Indo-European languages.

But the myth persists. So some people argue that it is a hoax perpetrated by the Europeans that Aryans came to India from outside. Some others equally strongly reject this 'revivalist' or 'chauvinistic' position. For them the Aryans did come to India from outside. It would not be easy to cite another example of a debate over the origins of a non-existent phenomenon. In the last decades of 19th and the early decades of this century debate served the purpose of defining 'we' in terms of 'the other'. Very few people thought anything of the question whether the debate was legitimate at all. By now however it has got so totally confused that one does not know if the people of India would ever be able to get out of the clutches of the non-existent Aryan-Dravidian divide. The reason why the myth persists or would persist is probably the fact that in a caste-society all categories of discrimination are easily accepted and legitimised.

The early indological research fuelled this extraordinary race-myth. European romanticism especially the German romanticism created a view of an Aryan race and Aryan India. In classical Sanskrit the word 'Arya' is never used in the sense of race. But the myth persisted. Along with it was born the myth of a superior civilisation of a superior people. All ancient civilisations have entertained the ideas of superiority. It was true of the Greeks and Romans. It was also true of the Chinese. The difference in case of India consisted in the fact that a colonised or rather vanquished people needed that myth not very much as a view of 'the other' but rather as one of the 'sources of the self'.[4] The ideas of and about India generated by European romanticism became a major constituting element of the Indian personality. We live in times when among the English-speaking liberals of India, at least an articulate section of them, the idea of India itself has probably become questionable. It is not easy, therefore, to see the force of these ideas or for that matter the appeal of the idea of India exists rather strongly for the not-so-enlightened people of this country. Since the liberals have lost interest in it, other forces have emerged as the sole repository or exponent of the idea of India.

Let us return to the phenomenon of the 19th century alluded to above. It was a grand imitation project—imitation of alleged or real characteristics of the British who had subjugated us. It was thought that one of the secrets of their triumph has been the organised, disciplined character of their faith. This was never quite articulated in these terms but if one looked closely to what was done to Hinduism in the 19th century one can see this imitation vividly.

There are other reasons too. Let me illustrate the point in the context of western India. Catholicism had come to western India in the 16th century. But it had remained an exclusive sect with little or no interaction with the Hindus. There were conversions of course. But the world of ideas of Hinduism was largely unaffected by them. The non-catholic Christianity which came to western India later was not so passive. It began an active interaction with the Hindus and in the pages of *Dnyanodaya* the Christian weekly originally published from Ahmednagar and later from Bombay, there was vigorous questioning of Hinduism, Hindu society and Hindu metaphysics. Not that all that was said was very meaningful. A lot of what *Dnyanodaya* had to say was based on ignorance of the texts and prejudice. Nevertheless it generated a debate among the liberal Hindus making them take a fresh look at the state of (western Indian) Hindu society of the time. It also generated a peculiar, distant admiration for Christianity. Witness Jotiba Phule's famous play *Tritiya Ratna*.[5] His term for God 'Nirmeek' was a clear borrowing from the Christian tradition. So was the Indian trinity—the Sanskrit coinage of 'Satyam Sivam Sundaram' (The truth, the auspicious and the beautiful), to cite just one example from Bengal.[6]

The Prarthana Samaj was influenced by the Brahmo Samaj of Bengal but both in turn were influenced by the church. They started the practice of weekly prayer-congregations and even sermons. Paradoxically all these imitations of Christianity and the rather brutal attacks on Hindu way of life carried on by the journals like *Dnyanodaya* stimulated the process of liberalisation and reform in Hinduism. Without any conscious design or even a fleeting awareness of the consequences of the positions they were taking the 19th century (non-catholic) Christian activities had contributed to a 'reformation' of a kind of Hinduism.

III

This 'reformation' had many aspects but perhaps the most important was fashioning Hinduism after Christianity. Christians had a book. The Hindus needed one. The *Bhagavad Gita* has always been an important text inasmuch as it was a part of the three main sources (along with the *Upanishads* and the *Brahma Sutras*: all three together known as *Prasthanatrayi*. The three ways to salvation) of the Hindu metaphysics. But in the 19th century and of course well into the 20th century the text of *Gita* acquires a status of 'the Book' as the term is normally understood in the semitic religions. The Hindus had finally found their book. A number of nationalists like Tilak, Arvinda Ghosh, Vivekananda, Gandhi and even Vinoba Bhave have written commentaries on the *Gita*. This connection between the 'Hindu' texts and our nationalist leaders had been interpreted by many as an attempt to use 'Hindu' symbols and texts for nationalist mobilisation. Tilak's attempt at launching a 'sarvajanik' Ganeshotsava (public festival of Ganesha) has also been interpreted in similar terms. It would seem, however, that these were imitations of Christianity in terms of creating a book and creating a collective festival like carnival.[7] In other words these attempts were more Christian than Hindu; at any rate more imitative than authentic 'Hindu' if Dharma Shastras are anything to go by.

This 'organisation' of an open-minded and even disorganised Hindu system was bound to result into emergence of a new

view of Hinduism and therefore of culture. The Satyashodhak movement of Phule and the Prarthana Samaj of Ranade and Bhandarkar had gone back to the medieval Bhakti poetry for the sources of religion. The other tradition went back to the brahmanical tradition. If the former represented a revolt, the latter stood for restoration of the vaidik tradition. In the context of the nationalist struggle with its unmistakable anti-imperialist overtones this restoration was not an undesirable thing in itself. To an extent it was inevitable.

Modern Indian historiography has looked at this phenomenon in Hindu and Muslim terms. The controversy over Vande Mataram is the most glaring example. But in the process the aspect of imitation of Christianity and Europe has been practically ignored. Acharya Javadekar, a thinker in the Gandhian-Marxian mould has touched upon the metaphysical constituent of the nationalism in Bengal. He had called it Bangalcha Adhyatmik Rashtravad in his brilliant book on Modern India first published in the late 40s.[8] In an earlier book published in 1940 he had traced the notion of metaphysical nationalism (Adhyatmik Rashtravad) to Hegel.[9] It seems to me that all traditional historical analysis has failed to see fully the connections between European influence and apparently metaphysical expression that anti-imperialism had inevitably found in the 19th and early 20th centuries. This is the reason why Javdekar's writing is important. Unless one sees these connections it would not be possible to see continuities between Tilak and Vivekananda on one side and Gandhi on the other and to explain why all of them had written commentaries on the *Gita*.

With the decline of anti-imperialism and now its disappearance, it is inevitable that a distorted view of nationalism and metaphysics should turn into revivalism. The forces which remained weak during the period of the nationalist movement have now come to dominate the scene. It was going to be a question of time before the metaphysical nationalism was going to be replaced by chauvinistic nationalism and religiosity turning into fundamentalism and revivalism. That has already happened. When the Indian state cannot and does not hold its own against the neo-colonialist onslaught, it creates a situation which is most appropriate to the talk of banning books, destroying places of worship like in Ayodhya and issuing 'fatwahs' to have people killed in the name of religion. Wilful destruction of economy also results in wilful or otherwise destruction of culture. In a situation of crisis, an insurmountable one at that, it is not very difficult to understand if an average man were to fear that but for his faith nothing else any longer belongs to him.[10] The professional community-leaders then use this fear so as to usurp the leadership and set into motion a process of lumpenisation of politics, economy and culture.

IV

In our situation which does not obtain anywhere in the developing world a unique phenomenon has been in operation. This phenomenon relates to the decline of Indian languages. Way back in the 12th century there was a movement to defend

and advance the cause of Marathi in Maharashtra. Of course this happened in other language areas too. The Bhakti movement gave voice to the lowly of the lowliest in our society. It was an authentic voice of self-expression. We are witness in present-day India to a situation of near-planned eclipse of Indian languages. There was a time when the Indian elite was bilingual. This meant that it was deeply rooted in its respective linguistic tradition and was also familiar with the modern European tradition. Now a typical member of the elite is vaguely familiar with Europe but knows probably next to nothing about his language and literary and cultural tradition. This situation has indeed acquired frightening proportions. Increasing number of people are politically and culturally thrown out of the system because the system has no use for them. On the other hand the people who manage culture are less and less familiar with what constitutes culture.

The net result is that culture acquires and indeed has acquired in our society necessarily negative meaning. Society gets divided into 'we' and 'they'. So does culture. For a Hindu being anti-Islamic becomes the only meaning of culture. It is the same with a Muslim. Our culture has also suffered from the language of pluralism and composite culture. As the French philosopher Gilles Deleuze has pointed out, pluralism is in the last analysis a variety of empiricism. And culture can never be understood in mere empirical terms. You cannot really take a view of Indian culture as pluralistic or composite without underlining the dividing line between the so-called Hindu and so-called Muslim culture. There is an Indian culture, music and literature being good examples which everyone shares and makes richer. What is Hindu or Muslim with the Raga Dari? You cannot reduce Indian culture to empirical categories.

I am aware that 'plural' has been a necessary part of the secular discourse in our country. I submit that both empirical and deterministic approaches to Indian culture have been destructive. They have assumed that there is no plurality within Hinduism or within Indian Islam. Expressions like pluralistic tradition are a slightly sophisticated version of the slogan of 'sarva dharma sama bhava' (equality among faiths and sects) which has outlived its use if ever it was useful. Just as Hindu metaphysics cannot be understood in terms of monotheism and polytheism, Indian culture cannot be understood in terms of a mono or plural tradition. At any rate the talk of plurality has only encouraged the talk of uniformity or vice versa if you will.

Whereas plurality is a myth which the secular discourse does not wish to abandon; uniformity is a myth the revivalist and fundamentalist discourse does not wish to abandon. The truth of the matter is that the Indian culture is an organic and historically determined unity which has escaped us over a period of time almost parallelly and simultaneously with slow but hopefully not yet certain destruction of India.

It is not customary to hold the secularists responsible for this state of affairs. Political parties like the Bharatiya Janata Party or the movements like the RSS or the Vishwa Hindu Parishad talk of a pseudo-secularism. That argument need not be taken very seriously because any view which rejects a 'uniform' or atemporal and ahistorical (the word 'sanatana' would mean that) views of Indian culture would be branded by them as pseudo-secular. The problem is not one of correct use of the term secular. As the German Marxist Ernst Bloch pointed out several decades ago the term 'secular' was borrowed from the bourgeois philistines anyway. The point simply is to identify the cultural crisis of our time. Neither the category of plural or composite culture nor the category of uniform and sanatana culture would be very useful in identifying and facing that cultural crisis.

In other words the enlightenment project is still not over in our society. Neither the pre-modern categories (of Hindu and Muslim, etc) or the post-modern categories (of rejecting the grand-narratives or theories in favour of fragments) will help that project. Alternative to enlightenment is darkness. In this situation the task of the liberals and the left becomes doubly urgent for they alone can handle the problem of culture. Following Walter Benjamin they alone can emphasise that all history of barbarism as well and as such can give direction to the explorations in culture. It is for this reason that one has to identify the shortcomings of the secular discourse. I cited Hobbes at the beginning of this paper. It might be worthwhile to conclude with another citation from him. There is a section on 'The Kingdome of Darknesse' in the *Leviathan*. There he talks of the forces very much comparable to what we have referred to. He says:

> ...the Kingdome of Darknesse... is nothing else but a Confederacy of Deceivers, that to obtain dominion over men in this present world ...[11]

That is what we are witness to. The problem of culture is the problem of 'the Kingdome of Darknesse' and of the Confederacy of Deceivers who are out to destroy not only culture but the society as well.

Notes

[This is a slightly edited text of an essay which will appear in a volume on culture edited by Pushpa Surendra and due to be published in August 1994.]

1 P S Sane, popularly known as Sane Guruji, was a Gandhian thinker, nationalist leader and once a very popular novelist and poet in Marathi. The book that we allude to was also written in Marathi and was quite topical when it was first published in the 40s inasmuch as it gave an alternative rendering of the Hindu world-view in polemical contrast to that of the Hindu nationalists.

2 This distinction is important because Savarkar had very little to do with Hindu metaphysics or theology. In contrast for Vivekanand nationalism became meaningful when and if it had adhyatmik (metaphysical) content in it. See also notes 7 and 8 below.

3 See Herbert Marcuse *Hegel's Ontology and the Theory of Historicity*, The MIT Press, Cambridge, Massachusetts, 1987. See especially Chapter 26.

4 This is a title of a book by Charles Taylor. He poses this problem mainly within the context of western civilisation. Sources of the self has the subtitle 'Making of Modern Identity', Cambridge University Press, Cambridge, 1984. This short paper is an attempt at describing our modern identity and the way it was made.

5 Jotiba Phule (1827-1890). A major social reformer who took the modernity debate in India to the sudras and atisudras.

6 See note 9 below.

7 To be sure Tilak did not refer to the carnivals at all. But his main point was the people should have a communitarian festival which would give them a sense of unity, of belonging, going beyond caste and class. Carnival does that for the Christians and Tilak could not have been unaware of it. Yet I would agree that this is mere speculation, hopefully a plausible one.

8 Acharya Javdekar published a book in the late 40s *Adhunik Bharat*, (*Modern India*) which is a classic. This is the title of one of the chapters there.

9 Acharya Javdekar, *Adhunik Rajyamimansa* (*Modern Theories of State*), Pune, 1940. This book also traced the European/Christian origins of the trinity of satyam sivam sundaram.

10 I think Marx refers to the melancholy which colonialism provided in his India writings. But even more relevant formulation would be that of the late Henri Lefebvre, the French Marxist. He says that under capitalism "along with God, nature is dying". See his *The Production of Space*, Oxford, Blackwell, 1991, p 71. His description would apply to the third world with even greater poignancy.

11 Thomas Hobbes in his famous work *Leviathan* first published in 1651 has a section on 'The Kingdome of Darknesse'. See pp 331 to 384 of the Everyman's Library Edition, London, 1975.

INDIA BRANCH

Schedule 17—Notes to the Accounts

I. Principal Accounting Policies

a) General

i) The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

ii) Revenues are accounted for on an accrual basis except interest on advances classified as "non-performing" according to the prudential accounting norms prescribed by the Reserve Bank of India.

b) Transactions involving foreign exchange

i) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the financial year except Foreign Currency Non Resident account balances which are carried at the rates specified by the Reserve Bank of India or at the spot rates of swap contracts, as applicable.

ii) Outstanding foreign exchange contracts and contingent liabilities on account of outstanding forward exchange contracts are at the contracted rates and have not been revalued.

iii) Income and expenditure items are translated at the exchange rates prevailing on the date of the transaction.

iv) Profit or loss on outstanding forward contracts is accounted for on an accrual basis.

c) Investments

i) Investments in Government securities other than treasury bills which are intended to be held till maturity, are classified as "permanent investments" in accordance with the Reserve Bank of India guidelines and are carried at cost.

ii) All other investments which are held on trading account are classified as "current investments" and are valued as under:
— "Quoted" investments are valued at "lower of cost or market value"
— "Unquoted" investments are carried at "Cost" or valued on "yield to maturity" basis whichever is lower.

iii) Provision for diminution in value of current investments is ascertained on an aggregate basis by category of investment.

d) Advances

i) Advances are net of provisions for loan losses made in conformity with the norms laid down by the Reserve Bank of India.

ii) Provision for loan losses is based on their classification into "performing" and "non-performing" assets in accordance with Reserve Bank of India guidelines.

Provision for non-performing assets is made as under:

Sub-standard assets	– 10% of net advance.
Doubtful assets	– 100% of the unsecured portion and 20% to 50% of the net secured portion depending on the period for which the asset has remained non-performing.
Loss assets	– 100%

e) Fixed Assets

i) Fixed Assets are accounted at their historical cost except Premises which are revalued and are accounted for at the values determined by Government Approved Valuers. The surplus on revaluation is credited to Capital Reserve. The premises were last revalued as on 31st March, 1993.

ii) Depreciation is provided for on the diminishing balance method at the rates specified in Schedule XIV to the Companies Act, 1956.

In respect of additions during the year, depreciation is provided with effect from the half year in which the addition is made.

iii) Depreciation in respect of revalued assets is provided for on the revalued amount and charged to the Profit and Loss Account.

f) Staff Benefits

Contribution to the approved Gratuity Fund is made as per valuation by an actuary.

g) Revenue Recognition

Income is recognised on expiration of time basis except interest on non-performing advances and guarantees/letters of credit commission which are recognised on realisation basis.

h) Profit and Loss Account

Provisions and Contingencies include:

i) provisions for taxes on income in accordance with statutory requirements,

ii) provision for doubtful advances,

iii) transfers to contingency and other funds,

iv) other usual or necessary provisions, and

v) bad debts written off.

II. The Bank has modified its accounting policy pertaining to valuation of Investments. Accrued interest paid on purchase of Public Sector Bonds, which was hitherto included in cost has now been charged to Profit and Loss Account. Consequently, interest income for the year is lower by INR 6,477 '.

III. Profit on Exchange transactions (Net) is net of INR 14,980 being the adjustment on final reconciliation arising out of computerisation of exchange transactions.

IV. The Bank has entered into an agreement for settlement of its dues by the owners/landlords of one of its erstwhile premises. Under the agreement the bank has received back its deposit together with interest. Moreover, the other co-tenants who had filed claim suits against the bank aggregating to INR 70,578 have, in principle, agreed to withdraw the suits on final clearance from the respective authorities for reconstruction of the building. The management is of the opinion, that these suits will be shortly withdrawn.

V. Previous year's figures have been regrouped/rearranged wherever necessary.

BANQUE INDOSUEZ

(Incorporated in France with Limited Liability)

INDIA BRANCH

Auditors' Report on the Indian Branch of Banque Indosuez under Section 30 of the Banking Regulation Act, 1949

We have audited the attached Balance Sheet of the Indian branch of Banque Indosuez (incorporated in France with limited liability) as at 31 March, 1994 and the relative Profit and Loss Account of the Indian branch of the Bank for the year ended on that date annexed thereto.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Section 211 of the Companies Act, 1956.

We report that:

(1) The bank has modified the method of valuation of Public Sector Bonds, as referred in Note II of Schedule 17 to the Accounts, resulting in interest income and profit for the year being lower by Rs. 6,477'.

(2) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.

(3) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian branch of the bank.

(4) In our opinion, proper books of account as required by law, have been kept by the Indian branch of the bank so far as appears from our examination of these books.

(5) The above mentioned Balance Sheet and Profit and Loss Account of the Indian branch of the bank dealt with by this report are in agreement with the books of account.

(6) In our opinion, and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, together with the notes thereon, give the information required by the Companies Act, 1956 in the manner so required for banking companies, and subject to para 1 above, give a true and fair view of the state of affairs of the Indian branch of the bank as at 31 March, 1994 and of its profit for the year ended on that date.

Estimates for Private Corporate Sector

A Note

N Shanta

Currently, estimates for the private corporate sector have to be derived from balance sheets and available profit and loss data. The incompleteness of this data precludes the possibility of undertaking macro-studies for the private corporate sector.

This paper explores the possibility of using other sources of data and assesses their reliability.

THIS note explores the possibility of deriving estimates for the private corporate sector from alternate sources of data. What prompted such an attempt is (1) the absence of estimates for the private corporate sector as whole (except perhaps for estimates of savings and capital formation published by the Central Statistical Organisation (CSO) and the Reserve Bank of India (RBI); (2) more importantly the total absence of data on the corporate sector in physical terms and (3) the changes made in the Annual Survey of Industries data since 1988-89.

The present position is such that one has to build estimates for the private corporate sector mainly using balance sheet and profit-loss data published by the RBI or other agencies. The nature of this data is such that they are firstly sample data and secondly give data only in financial terms. So one is forced either to go for specific industry studies supplementing balance sheet data with data in physical terms available for major industries. This therefore precludes the possibility of making macro-studies for the private corporate sector, particularly analysis of variables in physical terms. Given differential treatment in terms of taxation and other concessions granted by type of organisation macro-studies on the corporate sector as a whole are of great significance. It is in this context that an attempt was made to find out to what extent other sources of data can be used to make estimates for the private corporate sector as a whole.

Two alternative sources of data are examined in this context. (1) *Annual Survey of Industries—Summary Results for the Factor Sector*;[1] (2) Financial performance of companies—brought out by the Industrial Credit and Investment Corporation of India (ICICI) for the companies in their portfolio.[2] The former has been chosen because it is one of the most comprehensive sources of data for industry and the latter because it gives extremely useful data and perhaps as far as one's knowledge goes not elsewhere available. However, there are several snags in using these two sets of data for arriving at estimates for the private corporate sector. The purpose of this note is to put down the problems one encounters when using this data, stressing the missing elements and given the existing situation how best one could overcome them. This note is divided into three sections. Section I deals with the *Annual Survey of Industries*, data and Section II deals with the ICICI data. Section III sums up the discussion.

I
Annual Survey of Industries Data

This section deals with the *Annual Survey of Industries* data published by the Central Statistical Organisation. More specifically the *Annual Survey of Industries—Summary Results for the Factory Sector*. The annual survey of industries is carried out at two

FORMAT I. PRINCIPAL CHARACTERISTICS BY TYPE OF ORGANISATION

7 Wholly private	7 Unclassified	
8 Unclassified		

Source: CSO, *Annual Survey of Industries: Summary Results for the Factory Sector*, 1973-74, 1980-81, 1988-89.

different levels[3] (1) the census sector, (2) the non-census sector or the sample sectors. The census sector covers all factories employing 50 or more workers and using power or 100 or more workers and not using power. The sample sector covers those factories employing 10-49 workers and using power or those employing 20-99 workers and not using power. Data relating to both the census and the sample sector are combined and now brought out as the factory sector data. Our concern is with this factory sector data. Since 1973-74, two important tables published in the *Annual Survey of Industries: Summary Results for the Factory Sector* are (i) information by type of organisation (ii) information by type of ownership. The different characteristic for which information is given by these two groupings are number of factories, fixed capital, productive capital, invested capital, workers, employees, wages to workers, total emoluments, total input, gross output, depreciation and net value added. Based on this data certain structural ratios and technical coefficients by these two groupings are also published. The format of the data given by types of organisation and by type of ownership and changes introduced in the format over time are given in Formats I and II.

Combining these two tables one can arrive at the estimates for the private corporate sector. There are two possibilities. One method which has been used by Nirmal Chandra[5] is total corporate sector minus public sector. He mentions that this is not exactly comparable with the RBI Corporate Sector because it includes joint public sector. Since 1980-81[6] data are given separately for this segment and hence can be deducted from total corporate sector. However what intrigues one is while total corporate sector is defined to exclude departmental enterprises which form part of 'others', as Nirmal Chandra himself points out these departmental enterprises would form part of public sector. However since hitherto the data for departmental enterprises *per se* could not be taken out of 'others' to be added to total corporate sector or to be deducted out of public sector, the estimates obtained for the private corporate sector using this method would be underestimates. Since 1988-89[7] data on departmental enterprises are given separately and included under corporate sector. Although the logic of treating departmental enterprises as part of corporate sector is not clear, giving separate estimates for this segment is useful. However, since data on this segment for previous years is not known following this method (let us say Method I) for time series comparisons becomes difficult—that is the limitations of this method still remain.

A second possibility (say Method II) is to arrive at private corporate figures by deducting from estimates for wholly private enterprises the estimates for individual proprietorship, partnership and co-operative societies (private corporate sector being defined to exclude co-operatives to make it comparable with RBI data). Since 1988-89[8] however some changes have been made in the presentation of the data which creates difficulties for using this method. A separate category, viz, joint family (Hindu undivided family) has been separately enlisted. No mention is made however of where this category had been included hitherto. This again makes comparability over time difficult. So the only possibility for comparisons over time (since this new classification is available only for just one year) is to ignore it and follow the same method as in the previous years. Given these circumstances one feels that estimating for the private corporate sector following the second method (which also seems more straightforward and less ambiguous) is better. No doubt this has also its limitations. If one were to follow this method, estimates for the private corporate sector would be overestimates. Table 1 gives the estimates obtained for the private corporate sector using the different methods and incorporating the new data as and when they become available. If the different categories had been more clearly spelt out and a more detailed break up of data had been given, estimates obtained by the different methods should have been the same.

Total public sector would include departmental enterprises like ordnance factories. At the same time this is not included within total corporate. If we assume that all of 'others' is government factories and include it in total corporate sector, then by Method I the figures for non-public corporate will become as in Table 2. These adjusted figures seem closer to the figures got by using Method II particularly with respect to fixed capital. In the absence of detailed break up of 'others' this seems the only possibility

With the availability of more detailed data on the joint sector, these estimates (i e, using Method I) can be made more compatible with RBI corporate sector. Table 3 gives the estimates for the non-public corporate sector after making the necessary adjustments and compares it with estimates obtained using Method II. The estimates are for the year 1980-81. Here again the whole of 'others' is treated as non-departmental there being no break up of this category into its various corporate elements. These adjustments again seem to bring the estimates closer. Since 1988-89 information on departmental enterprises is separately given. Using this information also we can remove the defects of Method I. However even then we cannot check if it tallies with the estimates obtained by using Method II. This is because of other changes in the presentation of ASI data (viz, a separate category of Hindu undivided family is introduced without indicating where it had been included hitherto) which affect estimates made following Method II. Ignoring this latest change we compare the two estimates—by Method I and Method II (Table 4). The estimates are prepared for the year 1988-89 the only year for which this information is available as of now. Estimates for the private

TABLE 2. METHOD I—ADJUSTING FOR NON-INCLUSION OF DEPARTMENTAL ENTERPRISES WITHIN TOTAL CORPORATE

	1973-74	
	Employees (in Nos)	Fixed Capital (in Rs lakh)

corporate sector assuming all Hindu undivided family (HUF) as non-corporate are also given for comparison.

II
ICICI Data

The ICICI publishes data on the financial performance of ICICI-assisted companies. It is essentially sample data but information for different industries, by size of company, etc, are available. More importantly it gives information on important variables like number of employees, skilled, unskilled, mandays worked, capacity utilisation figures, etc. However, in spite of the very valuable information it provides and which is not available elsewhere, the manner in which the data are given does not allow one to use the information fruitfully.

In the first instance ICICI gives the coverage of the sample companies in relation to total corporate sector[9] which is very useful so that one can blow up the sample data and estimate for the whole. However, this information is not provided for all the years. One could of course as an approximation use the available coverage figures for other years also. Alternatively one could use the derived ASI data (which has been discussed in the previous section) for the private corporate sector and estimate the coverage. But the greater problem which arises is when one tries to use the information on employment. This data is collected for a sub-sample part of which is included in the larger ICICI sample but not the whole. For some years information on these companies which form part of the larger ICICI sample are given separatel,[10] so that one could again make approximations to the larger sample and subsequently to the whole. But even this information is not given uniformly. The biggest problem arises when one comes to the data on mandays employed.[11] No information on any other variable for this sample of companies which can be linked to other available information for the corporate sector is available.

Given the limitations of this data the only way in which one could use this information is as follows. That is the relationship between the sample companies for which information on employment is collected and the information as provided in the ASI is estimated and this proportion is used to blow up all other variables. Adjustments for non-coverage is also made.

Again since the sample size changes every two years these are quite crude estimates. Since this source of data gives very useful information not available elsewhere with all its limitations they still serve a useful function. One way in which one could overcome these limitations is to resort largely to the use of proportions, ratios and other statistical measures which are not affected by the limitations of the data.

III
Summing Up

While it is heartening to note that more detailed information is now being published certain doubts still remain. This note therefore ends with the plea to the data organisers, viz, the Central Statistical Organisation (CSO) which brings out the *Annual Survey of Industries* to make explicit the precise connotation of each category/group as best as they can and thereby remove the doubts that still linger. To the ICICI one's request is to provide information on sample data in such a manner that they can be used to estimate for the whole so that they serve a useful function and fill an important gap in the existing data on the private corporate sector.

TABLE 3: ESTIMATES BY METHOD I MADE MORE COMPATIBLE TO RBI DATA

Method I (as used by Nirmal Chandra)	Employees (in Nos)	Fixed Capital (in Rs lakh)	Method II	Employees (in Nos)	Fixed Capital (in Rs lakh)

Complexities of the Question of Sikh Nationality

Gopal Singh

While some scholars and religio-political organisations of the Sikhs, such as Akali Dals and SGPC, view the Sikhs as a nationality, certain Hindu chauvinists never tire of repeating that Sikhs are only a part of the larger Hindu community. The issue of Sikh nationality is actually more problematic.

THE complexities involved in the question of Sikh nationality have neither been properly comprehended nor adequately analysed by both the academics and the politicians. There has been a continuous, confused and motivated debate on this question right from the beginning of the century but without any final and convincing conclusions. On the one hand, we have had western authors[1] and certain religio-political organisations of the Sikhs, such as Shiromani Akali Dal (henceforth SAD) and Shiromani Gurudwara Prabandhak Committee (SGPC), according the Sikhs the status of a nation and indulging, in the case of the latter, in politically motivated propaganda. On the other hand, we have some Hindu chauvinists who never tire of repeating that Sikhs are only a part of the larger Hindu community, an assertion that irks the Sikhs because it denies them a distinct and separate identity.[2] The only serious attempt to grapple with this complex issue during the last few decades was made by K R Bombwall in his famous article 'Ethno-nationalism'.[3] Bombwall concedes the point that Sikhs are a politically conscious community but finds that the idea of their being a nation is problematic.[4]

In the first part of this paper, I join issue with those who claim that Sikhs are not a nationality. These include serious-minded scholars like K R Bombwall. In the second part, I engage myself in debate with those, including the communist parties, who support the 'Sikh-are-a-nation' thesis. The third part of the paper is devoted exclusively to my own understanding of the question of Sikh nationality.

I

The propaganda by the Hindu chauvinists, represented mainly by the Arya Samaj and the Rashtriya Swayam Sevak Sangh (RSS), that Sikhism was born out of Hinduism and therefore Sikhs are and will continue to remain a part of the larger Hindu community can be easily dispensed with. The thrust of their argument is that "history bears testimony that the Sikh creed was founded for the protection of Hindu society, its dharma and sanskriti".[5] To support their thesis, they cite the martyrdom by guru Teg Bahadur and the creation of the Khalsa Panth by guru Gobind Singh. They argue that guru Teg Bahadur laid down his life for the protection of Kashmiri pandits and that guru Gobind Singh created the Khalsa Panth, in 1699, to organise people militarily to fight the Mughal rulers.

Actually, much before the creation of the Khalsa Panth, which gave the Sikhs the five symbols of physical differentiation, the Sikhs had already established themselves as a separate community with a distinct identity. This point has been brilliantly discussed by Rajinder Kaur.[6] The Sikhs had their own institutions, symbols, scripture, script and place of pilgrimage (the Golden Temple).[7] So far as the sacrifices by guru Teg Bahadur, guru Gobind Singh, and also by guru Arjan Dev and guru Hargobind, are concerned, these cannot be interpreted the way the Hindu chauvinists do. These gurus fought against injustice, social inequality, exploitation and oppression; they fought against both the Muslims and the Hindus and gave a feeling of security to the exploited sections of the society comprising both Hindus and Muslims. For example, guru Gobind Singh fought his first battle against the Hindu kings of the Himachal hills.

Coming to a more serious discussion of the issues by K R Bombwall, he agrees that India is a "multi-ethnic and multinational state" and has no hesitation in describing Tamils, Bengalis and Andhraites as ethno-national groups. But so far as the Sikhs are concerned, though he agrees that they are an ethnic group, yet he has serious reservations about calling them a national group. One of the reservations he expresses is that "The Sikhs are by no means a monolithic social group", though soon after he asserts that the Sikhs as a "community have achieved a definite external differentiation (i e, differentiation *vis-a-vis* the adjacent social group, the Hindus) and its members have developed a distinct ethnic identity and common religio-cultural interests".[8]

He further says that "Sikhs are internally segmented. They are divided by caste, class and urban-rural cleavages".[9] He talks of caste divisions among the Sikhs, such as the jat Sikh landlords on the one hand and non-jat Sikhs, particularly the scheduled caste Sikhs, in the rural areas on the other, and the indifference of the latter to the demands for Punjabi Suba and for state autonomy, or, for that matter, to the Anandpur Sahib Resolution (ASR). He asserts that such divisions on caste and class lines are visible even in urban areas. Here, we have the urban Sikh trading community, popularly known as 'bhapas' (khatris, Aroras, etc) on the one hand and the daily wage-earner Sikhs, generally of lower castes, on the other. They we have caste-class division among artisans, such as carpenters (Ramgarhias), blacksmiths (Lohars) etc, right from the cities to the towns and the villages. But here my counter argument is: Do we not find these caste-class divisions in case of Tamils, Bengalis and Andhraites whom Bombwall has no hesitation in bringing under the category of 'ethno-nationalism'? At least on this ground, Bombwall should not deny the Sikh ethnic community the status of a national group.[10] Yet he continues expressing his doubts:

> It seems doubtful whether the broad Sikh masses have made 'the quantum jump involved in crossing the threshold from ethnic consciousness to national consciousness. The two are qualitatively different and national consciousness cannot be regarded as an extended form of ethnic consciousness.[11]

It seems to me that Bombwall is here falling in the trap of conceptual confusion. I believe that the Sikhs cannot be denied the status of a nationality simply because the community is not 'monolithic' and is 'internally segmented'. Because at least class divisions we find all around the world in what Bombwall has designated as 'ethno-national groups', and, in the case of India, caste-class divisions in all such groups are more than obvious.

Another serious reservation which Bombwall expresses is about what he calls "The SAD's split personality and dual orientation" By this he means that on the one hand the Akalis fight for their religious demands and on the other they fight for regional demands such as greater autonomy for states, particularly greater financial resources, inclusion of left-out Punjabi speaking areas in Punjab, a more favourable allocation of inter-state river water to Punjab, etc. And he concludes:

> The Akali doctrine of Sikh nationhood (and the related demand for a self-determined political status for Sikhs) is seen as a repudiation and disruption of the Punjabi nationality based on territory, language and culture [12]

Here I would like to make two brief comments. The first is about what Bombwall calls the split personality and dual orientation of the Akalis. There is no doubt that the SAD is a religion-based

party, and till recently a non-Sikh could not be its member. It is also true that not all the Sikhs are members of the Akali Dal. Quite a few Sikhs are members of the Congress, the communist parties, the BSP, the JD, etc. But when the Akalis raise regional demands, besides religious demands, one wonders how and why the Sikhs should be denied the status of a nationality on this basis? If this basis were to be considered valid, one would hesitate to call the Assamese or for that matter even the Kashmiris a nationality. Although the Kashmiris do not have a religion-based party, yet an overwhelming majority of them are Muslims. They have been raising a demand for secession on the basis of religious composition. On the other hand, the Assamese have also been demanding regional autonomy (AASU-AGP agitation of late 70s and early 80s) and recently even secession through ULFA. The basic issue before the Assamese agitators, besides autonomy, is the ouster of 'foreigners' (Bangladeshis, most of whom are Muslims). Secondly, not all the Assamese are members of the regional groups or parties. Many of them are members of the Congress Party, the Communist parties, the BJP, etc. Thirdly, and more importantly, there is another agitation within Assam, that of the Bodo tribe, for Bodoland. Then, should we assume on the basis of Bombwall's argument that Assamese or Kashmiris are not a nationality? On the other hand, if the Kashmiris or Assamese *are* a nationality, why should the Sikh community be denied the status of a nationality?

As regards the point that Akali doctrine of Sikh nationhood is (or should be) seen as a repudiation and disruption of Punjabi nationality based on language, territory and culture, I would pose a counter question: Who is the repository of the Punjabi nationality if at all anything of this nature exists today? After independence, the Hindus of Punjab have opposed even the regional demands raised by the Akalis, such as the demand for a unilingual state of Punjab. So far as the language and culture are concerned, the Hindus of Punjab, by disowning the Punjabi language, have made the Sikhs the sole custodian of the Punjabi language and culture. The Hindus, in fact, launched counter agitations both on the question of Punjabi Suba and on that of Punjabi language. I would elaborate this point later. Here it is sufficient to say that even on this point Bombwall's formulation is untenable.

Talking about the separatist movement of the Basques in Spain and the insistence on their distinct identities by Slovens and Croats in the former Yugoslavia, Bombwall says:

> The national consciousness can emerge even among ethnic groups which are economically as advanced as, or even more advanced than, the politically dominant groups in multi-ethnic states. What is crucial for the existence of a nation is its self-view or its psycho-cultural essence...[13]

I fully agree with this argument of Bombwall. At least on the basis of this argument, he should have had no hesitation in according the status of ethno-nationalism to the Sikh community. However, he concludes his debate on the positive note that in future the Sikhs 'can be a nation':

> The questions raised here do not necessarily imply a dogmatic rejection of the theory that Sikhs are a nation. What we have called ethno-nationalism may well evolve into a full state nationalism with all the political implications of the concept. The questions posed here are, in fact, a plea for a constructive academic debate on the issue involved.[14]

Bombwall's paper was first published in 1983, which means that he prepared it sometime in 1981-82. Had he written this piece after the happenings of 1984, he would probably have had a rethinking on the whole question. The Sikhs as a community were humiliated in Haryana when they were not permitted to go to Delhi during 1982 Asian games. They realised in 1984 that they were a minority community and can be persecuted and suppressed. Here I am referring to Operation Blue Star in June 1984 when their sanctum-sanctorum, the holiest of their holy places, the Golden Temple, along with other gurdwaras, was assaulted by regular armed forces. During Operation Woodrose in July 1984, rural Punjab was subjected to house to house search by the regular armed forces. And the biggest shock to the community came when thousands of Sikhs were massacred and burnt alive in Delhi, Kanpur, Bhilai, etc, after the assassination of Indira Gandhi in October 1984. These three events of 1984 not only sharpened the community consciousness of the Sikhs but also their national consciousness, and this happened in spite of the fact that there are caste-class cleavages and other internal differentiations and segmentations within the community. However, this is a point which I would elaborate and discuss further on.

II

The credit for evolving the thesis that the 'Sikhs are a nation' has been claimed by a number of groups and persons. These include Sardar Kapur Singh, Gurcharan Singh Tohra, Ganga Singh Dhillon, the SGPC, and even the members of the committee which prepared the draft of Anandpur Sahib Resolution of 1973.[15] Actually, the thesis had begun to be evolved much earlier. The SAD, under the presidentship of Master Tara Singh, had not only declared the Sikhs as a nation but had also articulated the demand for the creation of a Sikhistan in the years 1945-46. Earlier, soon after the Muslim League resolution of

1940 for the creation of an independent state of Pakistan on the basis of Jinnah's two-nation theory, the SAD had ambiguously talked about the demand for an 'Azaad Punjab' and a 'Sikh Homeland', etc.[16]

However, at the moment I want to emphasise the SAD's demand for an independent sovereign state of Sikhistan. I reproduce here the full text of a resolution adopted at Lahore sometimes in March-April 1946 by a very representative gathering of prominent Sikh leaders under the presidentship of Master Tara Singh:

> The Panth notes that at the present moment, on the eve of expected far-reaching changes in the constitution of the country, the desire on the part of the majorities to dominate the minorities is rising with great tempo, as is evidenced by the slogans of Akhand Hindustan and Pakistan. It further notes that in a situation so greatly charged with aggressive communalism, the minorities, especially the Sikhs, find themselves placed in a position in which they cannot safeguard their national existence against the high-handedness of a politically organised communal majority, which conviction is further strengthened by the experience of the working of Provincial Autonomy for nine years, resulting in grave attacks being made on the culture, and civic and political rights of the Sikhs in Punjab. After giving mature and thoughtful consideration to the foregoing, the Panth is strongly of the opinion that no safeguards and guarantees of a constitutional nature, no weightage or protection, promised to the Sikhs by any of the majority communities can be considered adequate to protect the Sikhs and ensure their free and unhindered growth as a nationality with a distinct religious, ideological, cultural and political character. In order to ensure the free and unfettered growth of the Sikh Panth, the Panth demands the splitting up of the existing province of the Punjab, with its unnatural boundaries, so as to constitute a separate autonomous Sikh state in those areas of the central, northern, eastern and south-eastern Punjab in which the overwhelming part of the Sikh population is concentrated, and which, because of the proprietors in it being mostly Sikhs and its general character being distinctly Sikh, is also *de facto* the Sikh Homeland—the area, extent, the status and the constitutional framework of such a state being left to be settled by negotiation between the accredited representatives of the Sikh Panth and other interested parties such as British government, the Hindus, and the Muslims; further resolving that the above demand is the unconditional, absolute and minimum demand and political objective of the Sikh Panth as a whole. The Panth visualises that this proposed state will be democratic in constitution and will have socialistic economic structure, with full protection of the culture and rights of the minorities.[17]

The main thrust of this resolution is that the Sikhs are a nationality and as such have a right to a sovereign Sikhistan.[18] It is an interesting fact that Akalis were not alone in demanding a sovereign homeland. The Communist Party in general and G Adhikari of this party in particular also advocated the demand of the Sikhs for an autonomous homeland. They believed that the Sikhs were a nationality by history, culture, economic way of life and language, etc.[19] In a booklet, *Sikh Homeland*, issued on the eve of Punjab assembly elections in 1945, G Adhikari advocated the right to self-determination to all nationalities, including the Sikhs. He said:

> Our party firmly believes that the edifice of an independent India, free from foreign control, must be based on three great pillars—complete democracy, self-determination to all nationalities and the well-being of our entire people... The people of various nationalities in India with their respective languages, cultures and historical traditions, whose homelands are today divided by the artificial boundaries created by the imperialists, must be free to form their sovereign constituent assemblies.
>
> The people of every national-territorial unit such as Pathanland, Baluchistan, Sind, western Punjab, central Punjab, Hindustan, Bihar, Rajasthan, Assam, Orissa, Andhra, Tamil Nadu, Kerala, Karnataka, Maharashtra, Gujarat and Bengal (with previous agreement for plebiscite of the Hindu and Muslim areas) should be able to form their own sovereign states in a free India, with full freedom for self-development in brotherly unity with each other.[20]

As for the Sikhs, after having established that they were a nationality on the basis of their common struggles, historical traditions, culture and language, etc, Adhikari spoke for an autonomous homeland of their own in the central Punjab where they, along with Hindus, constituted 65 per cent of the population. He wrote:

> The main homelands of the Sikhs, the Doaba, the Majha and the Malwa, lie scattered in the contiguous districts and the native states of the central Punjab. The whole villages after villages in these tracts are Sikhs. Here lies the cradle of Sikh people and their great historical traditions.
>
> The rise of Sikhism was something much more than a section of Hindus changing their form of worship. It was a great popular and cultural upheaval which roused and united a bulk of peasant Hindu tribes of the central Punjab—namely, the jats, rajputs, khatris, Aroras, ramgarhias, and the mazhils (*sic*, mazbhis). These sturdy peasant tribes were settled in the fertile regions of Doaba and Majha from times immemorial. There they built their village communities and developed agriculture. This region, however, lay in the path of every invader who came into India from the north. Again and again, these peaceful peasant communities were destroyed and scattered. They suffered under the reign of each invader and conqueror but they reformed themselves. It was under the rule of Mughal emperor-builders and of their mansabdars that the political and economic pressure on these peasant communities became intense and sustained. It was then that peasant tribes began to unite as a 'Sikh people'—to defend their life, their village communities and their peasant farms—under the inspiring leadership of the gurus.
>
> The rise of the militant Sikh movement under the latter gurus, especially under guru Gobind Singh—the sage of heroic martyrdom of Sikh warriors—is often understood as a chapter of religious persecution or religious wars. In reality it was the birth of 'a people'—peasant tribes uniting themselves into 'a people', shaping their language, creating their first inspiring folk literature—fighting to defend their way of life in their homelands. This popular upheaval, led by the Sikh gurus, which culminated in the emergence of the 'Sikh people' in many ways, was similar to the popular upheaval of the Maratha peasant tribes aroused by the saints of Maharashtra and united by Shivaji which in its turn led to the emergence of the 'Maharashtra people'. It is significant that both took place about the same time, i e, in the period of decline of the Mughal empire. Their subsequent history is also strikingly parallel. The awakened Sikh people built their own independent 12 tribe kingdoms—the 'misls'—in the Doaba and the Majha. The great Ranjit Singh, in the first quarter of the 19th century, unified them and built a strong fighting force...
>
> All these historical developments—the emergence of the Sikh people, the rise of the 12 'misls', their partial unification under Ranjit Singh, the formation of a virile language and the rise of powerful literature associated with it—made the Sikh people a leading cultural force in the central Punjab...[21]

How did the Communist Party (henceforth CP) come to adopt this stand? It appears to me that the party was over-enthusiastic about the definition of nationality as given by Lenin and Stalin. It forgot that this definition had emerged in the background of the conditions prevailing in Russia/Soviet Union. The adoption of this definition led to a distorted understanding of the developing Indian situation. However, it must be mentioned to the credit of CP that it reversed its stand on this critical issue around mid-1950s, and the today's main communist parties—the CPI and the CPI(M)—are staunch votaries of a strong and united India though they hold the view that India is a multinational state and every nationality must be given an opportunity to develop its own culture, identity, language, art and literature, etc. It is with this view that these two parties vehemently oppose the secessionist movements in Kashmir and Punjab.

Coming back to the SAD's demand for Sikhistan, I think it was a last-ditch battle for political survival as the partition of Punjab also meant a partition of the Sikh population, a development which stood to weaken the base of the SAD. The demand for a Sikh homeland was a panic reaction on the part of the SAD.

In this background, how does one look at the Sikh community from independence and partition till today? And how does one analyse and explain the political behaviour of the SAD during this period? In this connection, two points need to be emphasised right in the beginning. The first point is that the partition of Punjab was probably the bloodiest such event in human history, which resulted in the massacre of millions of people of three communities—the Sikhs, the Hindus and the Muslims—and the migration of virtually the entire Sikh-Hindu population from Pakistani Punjab to India and of Muslims from Indian Punjab to Pakistan.[22] This migration, nevertheless, gave the Sikhs a majority in six districts of Indian Punjab. This was an important development because the British, at least on paper, had denied the Sikhs an autonomous homeland arguing that the Sikhs were not in majority in any district of the pre-partition Punjab. This development re-awakened a hope in the SAD supremo Master Tara Singh to once again raise the demand for a Sikh homeland, of course within the union of India, a demand which went unheeded virtually for two decades. The second important point is that right from its inception in December 1920, the SAD has been a faction-ridden party, a theme which I have discussed in detail elsewhere.[23] What is the condition of the SAD today? Till recently, there were at least four Akali Dals—Akali Dal (Badal), Akali Dal (Longowal), Akali Dal (Mann), and Akali Dal (Manjit). On the other hand, there were at least 25 militant organisations of the Sikh youth fighting for an independent and sovereign state of Khalistan through violent means. Each one of these militant organisations owed allegiance to one or the other of at least three Panthak Committees. However, as I have noted elsewhere, in SAD's 72 years old history, there have always been three broad factions within the party—the moderates, the extremists and the militants.[24]

There is no doubt that the Sikh community, first under the leadership of Master Tara Singh and then under that of Sant Fateh Singh, had to launch many a struggles (morchas) even for the reorganisation of Punjab on linguistic basis. The Punjabi Suba was created in 1966 giving the Sikhs a majority of around 60 per cent of the total population. But after their failure in ministry-making during the period 1967-71 when Akali-led coalition ministry did not survive, and loss of power to Congress in 1972 elections, Akalis prepared a new action plan in the form of the Anandpur Sahib Resolution (1973) which demanded a geographical territory where the 'Khalsa shall be in a position of pre-eminence' (Khalsa ji-ka-bolbala). When this resolution was ratified in the 18th all-India Sikh Conference (general house of Sikhs) at Ludhiana, G S Tohra had already issued his booklet *Federal Polity*. Both the ASR and the *Federal Polity* declared the Sikhs as a nation and pleaded for greater autonomy to all states, leaving only foreign relations, defence, currency and communications to the union of India. Tohra advocated a federal structure on the pattern of the then Soviet constitution. In July-August 1982, the SAD started its morcha (agitation) under the leadership of late Sant Harchand Singh Longowal, after having invited Bhindranwale to join the morcha. Bhindranwale did join when his demands were also incorporated in the Akali charter of demands. It was a turning point both in the political history of Punjab and also of the SAD. A new phase of violence and terrorism started. This period witnessed storming of the Golden Temple and other gurdwaras in Punjab by the regular Indian armed forces at the instance of the then prime minister Indira Gandhi, who herself was assassinated by two Sikh guards, an incident which led to the massacre of innocent Sikhs in Delhi, Kanpur, etc, by the marauding-lumpen gangs.[25]

Among different factions of the Akalis one faction, right from the pre-partition days, has consisted of what I call 'homelanders'.[26] By 'homelanders' I mean those who have always advocated the idea of a sovereign Sikh homeland,[27] whether within the Union of India or outside it. The homelanders are the Khalistanis in today's context. The intellectual god father of the homelanders in post-independent India was late Sardar Kapur Singh[28] who created a following in the different universities of Punjab and among a section of Sikh intelligentsia.

So far as the issue of the Sikh community being a nationality is concerned, it seems to me that there has been a lot of confusion among the Sikhs over this issue. Firstly, the Sikhs belonging to parties like the congress and the communist parties have rejected this idea. Secondly, both among the leaders and members of the SAD, there has been a section which did not support this idea, for example Jivan Singh Umranangal and his followers. Therefore, the question that arises here is: Should the Sikhs be denied the status of a nationality just because some Sikhs, both Akalis and non-Akalis, are opposed to this idea? However, a more complex question that

needs to be answered is: If the Sikhs are a nationality, what are, then, the Hindus living in Punjab, and what is this thing called the 'Punjabi nationality' or Punjabyiat?

Before I come to my own views on these questions, I would discuss the views of those Sikh and western historians who claim that Sikhs are a nation. Paul R Brass[29] quotes Cunningham who put forth this view right in the beginning of this century. He also quotes Ganda Singh and Khushwant Singh, the two Sikh historians of eminence, who express the same view. Cunningham talks of the development of the Sikhs "from a sect into a people under guru Gobind Singh, and from a people to a nation under Ranjit Singh".[30] Khushwant Singh writes of the struggles of the Sikh forces against the British in 1848 as of a nation rising in arms, and of the second Anglo-Sikh war of 1848 as a national war of independence.[31] Ganda Singh goes further back and finds Banda Bahadur a hero of the Sikh nation in early part of the 18th century because of his struggles and victories against the Mughals. He writes:

> Although the successes of Banda Singh were but temporary, there was a revolution effected in the minds of people of which history often fails to take notice. A will was created in the ordinary masses to resist tyranny and to live and die for the national cause. The example set by Banda Singh and his companions in this respect was to serve as a beacon-light in the darker days to come. The idea of a national state long dead, once again became a living aspiration[32]...

To begin with, Brass does not seem to agree with this view-point of the historians. He believes that

> The Sikh historians and politicians have been engaged in a process of symbol selection from the events of the past, adapting those which would best support contemporary Sikh self-consciousness and rejecting those which would not.[33]

While talking of inconvenient symbols, he points out "a characteristic lack of congruence in pre-modern times between the corporate spirit of the people and the factional divisions of their leaders", "between the loyalties of fighting forces and the treachery of commanders", etc. He satirically mentions the alliance of the "cis-Sutlej kingdoms" with the British from 1809 against trans-Sutlej Sikh powers, and of the cis-Sutlej Sikh kingdom having turned the tide in favour of the British rule during the mutiny of 1857, thereby securing British imperialism in India "for another century" and the "loyalty" of surviving Sikh kingdoms to the "British Raj" during the nationalist movement and their "opposition to the main Sikh nationalist organisations and the internecine conflict."[34] However, what is interesting to note is that when Brass concludes his arguments, he tends to agree with the view of historians mentioned above:

> Modern nations are anyway built more upon the selection and manipulation of symbols from the past than the persistence of real political structures into the present.[35]

If one agrees with Ganda Singh's proposition that Banda Singh's victories, though short-lived, created national consciousness among the Sikh people and an aspiration for a nation state, and if one goes by this criterion, then the period of the Sikh national consciousness must start with the sixth guru, Hargobind, because he was the first to wage some battles against the Mughals. In any case, this period can be said to have started with the creation of the Khalsa Panth (1699) by Guru Gobind Singh who not only gave the community symbols of physical differentiation but also prepared them to fight militarily the tyranny of the Mughals. As for Khushwant Singh calling Anglo-Sikh wars as wars of (Sikh) national independence, one must point out, as does Brass, that during these wars a part of the community had aligned with the British and therefore the wars were in part wars within the community. This makes a labelling of these wars as 'national' a bit problematic.

III

As mentioned earlier, Bombwall raises the question whether the national consciousness among Sikhs is only an elite phenomenon or it has percolated among the masses. I really do not know what exactly is the view-point of Bombwall today because he expressed this particular doubt a decade ago.[36] At that time he tended to limit national consciousness to elites only. Since then dramatic developments have taken place in Punjab and elsewhere, particularly the incidents in 1984 which affected the psyche of Sikh community as a whole. Therefore I have no reservations about stating that national consciousness has percolated to the broad Sikh masses, despite the caste-class cleavages in the community and the disillusionment about the activities of the militant organisations. W H McLeod's main concern, in his book *Who Is a Sikh? The Problem of Sikh Identity*, is about the problem of 'sehjdhari' Sikhs as against the 'keshadhari' Sikhs.[37] However, to put a question mark on the Sikh identity in this manner in 1988-89 does not make sense. For by the end of 1980, this identity was well-settled.

As against Bombwall and McLeod, I perceive the historical development of Sikhism in different phases right from the period of the first guru till today. First was the phase of community formation which in my opinion was complete by the time of the martyrdom of fifth guru, Arjan Dev. By this time, Sikhs as a community had developed a distinct and separate identity. The trio of the guru, the 'granth' and the gurdwara was the focal point of the identity, and the institutions of sangat (congregation), pangat (taking the meals together in the same line irrespective of status or caste) and langar (free kitchen) went a long way in crystallising the identity. However, it was the construction of Golden Temple, with Harmandir Sahib as the spiritual seat and place of worship, the Akal Takht as a place for discussion of temporal affairs, and the wearing of two swords by the sixth guru as symbols of 'piri' and 'Miri', that completed the process of community formation.[38]

The second phase begins with the sixth guru and comes to an end in the post-Banda period of mass persecution of the Sikhs when quite a few new institutions were introduced and the community developed into an ethnic group. The most significant development of this period was the creation of Khalsa Panth by 10th guru on April 13, 1699, which not only gave the five physical symbols known as five Ks but also gave a psychological boost to the hitherto suppressed followers of the gurus, particularly the peasants, and inspired them to prepare militarily to fight against the Mughal tyrants. The adventures of Banda Singh after the death of 10th guru, in which he inflicted defeat after defeat on the Mughal armies, proved beyond any doubt that the military force created by the guru was capable not only of fighting against better organised forces but also of winning. After the persecution of Banda in most humiliating way, there was such a massive repression of the Sikhs that they were forced to flee to the jungles where they slowly reorganised and after some time started ruling over small areas. Thus began the period of the misls. During this period three institutions were evolved: the Dal Khalsa (different armed bands of the khalsa), Sarbat Khalsa (bi-annual general body meeting of the khalsa in the Golden Temple) and the Rakhi system (protecting everyone who paid taxes and remained loyal to the khalsa). This in my opinion was the period when the community became a full-fledged ethnic group.

The amalgamation of different misls into an empire with Lahore as its capital by Ranjit Singh is generally regarded as the golden period of the Sikh history and some historians like Cunningham assert that during this period the Sikhs became a nation. But I have a different point of view. It is true that Ranjit Singh ruled in the name of the khalsa, but he indulged in empire-building rather than serving the cause of the khalsa in the real sense of the term. More significantly, he abolished the two important institutions of Sikhism—and Dal Khalsa and the Sarbat Khalsa. In many ways, he permitted himself and the community to relapse into the orthodox Hindu rituals—thus diffusing the boundary

definitions of the two communities. One does not need much historical evidence to assert that he himself and quite a few Sikhs re-adopted brahmanical rituals against which all the Sikh gurus had fought so vigorously. Even the idols of Hindu gods and goddesses were placed in gurdwaras. As during his regime and in his lifetime, the Hindu rituals were conspicuous at the time of his death. Some of his wives/mistresses committed sati on his funeral pyre, something strictly prohibited in Sikhism and totally banned by the Sikh gurus.

Therefore, I believe that the nationality formation of the Sikhs took place during last 120 years or so, i e, from the beginning of the Namdhari or Kuka movement to the end of 1980s and through the various struggles against and the persecutions by the ruling powers. Baba Ram Singh and his followers of the Kuka movement fought against British imperialism on the one hand and for reforms in Sikhism on the other. It is well known that some 70 Kukas were blown out of the canon-mouth at Malerkotla by the British. The aim was to teach them a lesson rather than to punish them for a crime, and Ram Singh was exiled from Punjab to Burma to crush the movement. The British succeeded in their efforts but the movement left a deep imprint in the psyche of the Sikh peasantry. There is no doubt that there were some collaborationist elements among the Sikhs, particularly the landed Sikh aristocracy.

Another massive upsurge which was in congruence with Sikh national aspiration was to be seen during the Gurdwara Reform Movement (1920-25). During this movement hundreds of unarmed non-violent Sikhs were done to death when they went to liberate the gurdwaras (particularly Nankana Sahib) from the corrupt 'mahants' and thousands were put into jail. Also, the break away faction of the Sikh youth known as Babbars took to militancy. The Babbars, like Kukas, attacked two enemies—the British imperialists and their informers (mukhbirs) even if these were the Sikhs. The collaborationist Sikhs were denounced as 'jholi-chuks' (toadis) and were the main targets of their attacks. Like Kukas, the Babbars were crushed by the British when Gandhi denounced them as misguided patriots and the SGPC and SAD also went by the statement of Gandhi. The point which I want to emphasise here is that the heroic sacrifices made by Kukas and Babbars did create a national consciousness among the ordinary Sikh masses, particularly those inclined to puritanism.

During the partition, the Sikhs as a community suffered a great loss of life and property when they, along with the Hindus, were hounded out of Pakistani Punjab. I believe that the losses thus experienced by the community as a whole further strengthened the sense of national consciousness among the Sikhs. By this I do not mean to say of course that Hindus or Muslims did not suffer any loss of life and property. My point is altogether different.

As I have mentioned earlier, the three incidents of 1980s have finally consolidated the national consciousness among the Sikhs. It is difficult to foresee a dilution in this consciousness because in these incidents the Sikhs as a community suffered humiliation, unforgettable psychological blows, physical injuries and loss of life and property.

Therefore, I am of the view that Sikhs today are a nationality like any other nationality in India. I would be happy if someone comes out with a definition of nationality which Sikhs do not fit into.

17 Quoted from Gurbachan Singh and Lal Singh Gyani, *The Idea of the Sikh State*, Lahore Book Shop, Lahore, 1946, pp 1-3.
18 The fear of deliberate and persistent attempts to devalue and liquidate the Sikh people in free India and the determination to resist such attempts have formed the refrain of numerous resolutions passed by the SAD and public announcements of the Akali leaders True, none of the SAD factions has defined Sikh nationalism in terms of a sovereign Sikh state as its objective. However, it was after the establishment of the present Punjab in which the Sikhs constitute a majority that the well known Sikh scholar-politician, the late Sardar Kapur Singh declared the Sikhs *sui generis* a "free and sovereign" people who had a *birth right to claim and establish a sovereign political status for themselves by creating homeland.* Referring to a resolution passed by the Akali Dal (Master Tara Singh) Working Committee on July 20, 1966, Kapur Singh stated that "a new Punjab should be given an autonomous constitutional status on the analogy of Jammu and Kashmir". As early as May 1965, the Akali Dal (Master), which spoke for a minority of the Akalis, asserted that "there was no alternative left for the Sikhs, in the interest of self-preservation, than to frame their demand for a self-determined political status within the republic of Union of India." The constitution of united Akali Dal, approved on September 2, 1974, included among the party's objectives "the preservation, among the Sikhs, of a consciousness of an independent Panthak identity and carving out a territory and era (desh and kal) wherein the *national sentiments and nationhood of the Sikh Panth* may find the fullest embodiment and expression." An SGPC pamphlet, *Sikh Ate Bharati Rajniti* (Sikhs and Indian politics), published in 1974, included five pages listing complaints of "economic attacks on the Sikhs by the centre", "injustice to Sikh religion", "political excesses against the Sikhs" and "discrimination and excesses on all sides". The theme of *Sikh Kaum nal Dhoka* (injustice to the Sikh nation) also figured prominently at the Ludhiana Akali Conference, held in October 1978. This theme also ran through the 45 points of the charter of demands of the Akali Dal (Longowal) submitted to the prime minister, late Indira Gandhi (see K R Bombwall, op cit, pp 51-52).

Agricultural Growth in West Bengal

S Datta Ray

THIS relates to an article entitled, 'Agricultural Growth in West Bengal in the 1980s' (*EPW*, March 26). The authors have stated, "in the 1980s the BAES method of estimation (based on crop cutting samples) was adopted by GOWB" (*vide* para 1, Section II: Data and Methodology). They elucidated it by a note (numbered 7 in Notes at the end of the article) reading as "currently, estimates are prepared by the BAES on the basis of estimates of yield that are obtained from crop cutting experiments jointly conducted by BAES and the directorate of agriculture". There are grave factual inaccuracies and gaps in the authors' statements. Since I was director of BAES, though briefly (October 1990 to January 1992) I would like to set right below the wrong impressions created by the authors' above statement certifying the quality of the GOWB crop data of the 1980s which they used without revision unlike James K Boyce and came to some doubtful conclusions. The facts are: (i) The state agriculure department continued to change unilaterally the yield figures furnished by BAES at least of wheat throughout the period, 1981-82 to 1985-86. (ii) From 1986-87 a sea change occurred in the system of collection of crop data in the state in which BAES has only a minor role to play.

Regarding the crop area, the sampling design which was in operation till 1985-86 has been replaced by a new one (EARAS) at the instance of government of India whose efficacy (and statistical efficiency) has not yet been reported by its implementing agencies, viz, the land and land revenue department and the agricultural department. The field work which involves complete enumeration of C S plots in all the sample revenue 'mouzas' is done by the 'amins' of the land and land revenue department and estimation of crop area therefrom by the agriculture department. Under the scheme, 20 per cent of revenue mouzas are to be enumerated each year selected by way of sampling but the coverage could not reach even a modest 15 per cent mark till 1991-92. It is worth stating that such collection of plotwise area (both crop and non-crop) utilisation data in each of the four season in a year is an additional item of work for the amins and is not subject to any regular and systematic supervision by the departmental officers. Hence the quality of crop area data could hardly be certified to be acceptable without detailed examination.

Regarding crop cutting experiments, each season these amins are to send complete lists of plots growing seasonal crops in respect of a sub-sample of revenue mouzas to the district offices of BAES for subsequent selection of crop cutting plots. The sample crop cutting plots in each development block are selected in two independent sets—one for experimentation by Krishi Projukti Sahayaks (KPS) of the agriculture department and another by the regular investigating staff of BAES. Thus it is clear that the experiments are not jointly performed by the staff of the agriculture directorate and BAES as claimed by the authors, but independently. Though the subsequent arithmetical calculations needed for yield estimation are done in BAES, it has no say in the statistical/methodological work. For instance, under specific instruction of the state agriculture department which is the state authority for agricultural statistics, BAES takes an unweighted average of the two yield estimates of a crop in each block thrown up by the crop cutting results of experiments done independently by the two agencies differing so much in orientation, training, and supervision apparatus. This averaging of the two independent estimates at the block level is done, irrespective of differing numbers of crop cutting experiments performed by the two groups of workers, and also ignores results of statistical significance tests of the difference between the two yield estimates. It may be stated here that KPS themselves are responsible for agricultural development work in their respective localities, and hardly find time for such additional work necessitating timely visits of the experimental plots during the harvesting season. And after what Boyce exposed earlier on the attitudinal front of the agriculture authority in the state, would any one accept it (i e, the official crop production/yield estimates in 1980s) to be a legitimate baby of BAES, the unhappy partner in the current multi-agency system? In any case, the state government is yet to publish its justification for the adopted system of pooling the two sets of yield estimates which, I apprehend, are significantly different in magnitude for most of the crops.

Another disturbing issue is the likely large extent of loss of planned crop cutting experiments resulting from the current multi-agency system in operation. The seasonal crop plot lists despatched by the amins of the land and land revenue department seldom reach the BAES district offices in time, i e, by scheduled dates. It may be appreciated that unless the sample crop plot lists of a season are prepared well in advance of the beginning of harvesting of the related crop, the experimenters after receiving the selected crop cutting plot lists from BAES would not be able to conduct the experiments on the originally intended plots and would have to be contended at best with substitutes if allowed from late harvesting plots. During my short tenure as the head of BAES it was a shocking discovery that a very large percentage of scheduled crop cutting experiments could not be performed for various reasons, the principal ones among which were (i) harvesting of the seasonal crop prior to field visits by the experimenters and (ii) absence of the crop in the selected plots themselves presumably due to bad field work at the crop area enumeration stage. Even when substitution was allowed, a large number of targeted experiments could not be conducted due to shortness of available time. Substitution to any appreciable extent is in itself undesirable, being fraught with the risk of inducing bias in yield estimation. For instance, if the yield obtainable from the early harvesting plots differ in any significant magnitude from the late variety yield, the compiled yield rate in which early harvestable plots were not duly represented and the late harvested ones overrepresented, would not reflect the reality. Very often, early harvesting takes place in unirrigated high paddy fields and late harvesting occurs in low or irrigated lands. Since irrigated yield is usually much higher than the unirrigated, it is a near certainty that the compiled yield obtained by substitution of early harvesting plots by late ones would show bias beyond an acceptable limit. The bias may be further aggravated in actual field condition because the HYV seeds are cultivated in irrigated plots and local low yielding seeds sown in unirrigated ones. Further, loss of allotted experiments by any significant number for whatsoever reasons render the estimates prepared from the available data unamenable to valid statistical treatment and inference. Since three functionally different agencies are involved in collection of crop data and efficient co-ordination is a far cry in this land where nobody takes responsibility involving hard and sincere work, a very large number of targeted crop cutting experiments remain unperformed every season, wrecking the very bias of sound statistical estimation or inference.

Again, regarding the claim of a very large extent of HYV seeds coverage in the state particularly in the kharif season, one should make a close scrutiny of the method currently adopted by the agricultural department for its determination. The HYV area coverage of a crop is estimated by the proportion of crop cutting experiments reporting use of HYV seeds. When a large number of crop cutting experiments on the early harvesting local variety crop are missed, the performed experiments would be largely concentrated in irrigated plots sown with HYV seeds.

Under such circumstances, the representation of HYV plots in the set of conducted experiments would be disproportionately large. Thus such an estimate of HYV coverage would remain a suspect. In case of boro (or summer) paddy or wheat, substitution would, however, make no difference in estimation of HYV coverage because the local varieties are no longer cultivated in the respective season.

We feel that a researcher should examine the quality of the basic crop data of West Bengal in the 1980s and subsequent times before undertaking any serious study based on them, as did the renowned James K Boyce for an extensive earlier period. The point would be amply borne out by the following extract of a news item appearing in *The Statesman*, Calcutta (August 28, 1992) entitled, 'Basu sore at claim on rice production' written by its special representative. "Mr Jyoti Basu lost his temper at a high-level meeting held in his office at Writers' Buildings on Thursday to review the food situation especially the crumbling rationing system. The provocation was a recent statement by the agriculture minister, Nihar Bose, who claimed that West Bengal had become a major rice surplus state by producing a record 12 million tons in 1991-92... What irked the chief minister was that Mr Bose's assertion had already been disputed by the union food secretary Mr T Khanna, who, at a recent meeting on rationing in New Delhi, had said that West Bengal's claims, both in the field of land reforms and doubling of food production were 'highly suspect'... Already the centre has told West Bengal that if the state really had surplus rice, why was it ask(ing) for one million tons of highly subsidised rice from the centre every year?"

Child Marriages and State

Manu N Kulkarni

IT is very unfortunate that NGO leaders like Shankar Singh et al (*EPW*, June 4) defend child marriages in Rajasthan, when they assert, "The internal logic of child marriage is fairly sound. Child weddings take place primarily amongst OBCs and dalits and therefore most often poorer families." According to them "the 'muklava' or 'gohna' is delayed and the married girl does not go to the in-laws' place till the age of 18 which is the legal age of consent. There is sufficient internal pressure within rural communities to support any effort to delay the ceremony of mukhlava."

Will Singh and his friends provide family-level evidence regarding the delay in mukhlava among the married adolescent girls in Rajasthan? If one does a survey, girl-by-girl and ascertain when they got married and when they were sent to in-laws' house for mukhlava we would really come to know the time gap between marriage and mukhlava. In the absence of such evidence it is all a social hunch not supported by facts. In fact the pressures are different. The in-laws of the girls do not want the girls to go to school because she is 'married'. In one of my field visits in a village of Gwalior district of MP, I asked the mother of the girl who was married at 13, why the girl was not going to school, the mother replied that the in-laws and particularly the husband of the girl (age 20) does not want his 'girl-wife' to go to school lest she becomes more literate than him. Girls when 'sold' in marriage get a price (called natra in these districts of MP). Hence there are economic pressures for marrying girls early. These parents put forward the excuse of not getting bridegrooms later when girls grow. But the hidden agenda is to get the price for the girl! The Child Marriage Restraint Act is a non-performing act and the state alone cannot enforce the minimum age of marriage unless the NGOs, the parents of both the girl and the boy and the caste leaders join hands in this campaign against child marriage. The incident in Rajasthan where Banwari was gang raped because she campaigned against child marriage, is unfortunate, but that incident instead of slowing down the campaign should intensify it, and NGOs instead of defending child marriage should vehemently intensify their fight against early marriage of girls.

The districts of Mandsaur, Ratlam, Rajgarh and Guna in MP which are bordering Rajasthan have similar problems of child marriage and on akshaya tritiya (akha teej) in these districts thousands of girls are married in group marriages. In the last two years the collectors of these districts in MP have launched campaigns against child marriages and have successfully averted and postponed such marriages using persuasive, coercive and other social mobilisation techniques. In Mandsaur district the dynamic collector Ramsingh Tolia successfully used his government functionaries, the press, the NGOs and caste leaders to avert and postpone hundreds of child marriages in May 1994 among the OBCs like lohars, dhobis, kumavat, gujars, mali, chamar and patidar. He mobilised everybody in the district for this campaign and press reports have captured the events poignantly:

—In Narsinghpur Block Galyakhodi village the parent Madanlal cancelled the engagement of the girl child Manju just before the group marriage, when Koumi Ekta Committee and Nari Hitchintak volunteers approached him and explained him the consequences of girl child marriage (*Dainik Bhaskar*, Indore, May 10).

—Nehru Yuvak Kendra and Mahila Balvikas Adhikari in Umaheda village in Mandsaur district approached a family where girl child was to be married. The pandit, Shankarlal who was ready to solemnise the marriage turned around and said that he will never solemnise such a marriage which affects the life of the child and folded his book and 'pethi' and also pledged to tell other panditjis not to solemnise girl child marriages.

—The jatha in Sitamahu village filed a complaint with the police against four parents trying to marry their girls (12 years old) under the Child Marriage Restraint Act.

—Four school-going boys of Narasinhpur in Mandsaur pledged not to marry, despite the pressure of their parents, before reaching the age 20 and would complete their study (*Dainik Bhaskar*, May 8).

—Kharvahi village resident Phulsinha Dangi got his 12-year-old daughter Anita married to a 30-year-old man and on the muklava (gohna) day she fainted with vaginal ruptures and was admitted to district hospital and was treated by Manju Jain (*Sandhya Prakash*, Indore, May 16). Police complaint was filed and a case was registered.

—In Sitamahu block, Meriakhedi village, child-bridegroom Shankar Gurjar, learnt when he was ready to go in 'barat', that the marriage ceremony was cancelled, he threw his 'pagdi' and jumped from the cart and ran away to play with his friends (*Dashpur Darshan*, May 14).

—'Barat lauti' was the caption of a lead story in *Dainik Press* of May 13, in which six girls were stopped from wedlock when volunteers of Kaumi Ekta Parishad and government functionaries landed in the house of Ramnarayan Kumavat in Lodha village of Mandsaur district and stopped his four small daughters from facing the barat.

—In Ratana village the lady drum beater in the festivals, Geeta Devi, when approached by volunteers of campaign against child marriage, agreed not to beat the drum in the marriage of girls of her village and took a pledge before the goddess Durga of the village, that she would never do such things again.

Such small acts initiated by a cross section of village communities can alone bring awareness and build social pressures against child marriage. Campaigns are one time activities but the collectors have kept a vigil on such families who have cancelled the marriages so they do not perform the marriages of girls secretly. The girls of these families have to be put into school, which alone can empower these girls and schooling alone is the best weapon against child marriage.

STATE BANK OF BIKANER AND JAIPUR

Three generations of small savers. There's one thing they all trust–Units.

Even people generations apart think the same way when it comes to Units. Because Units help make their dreams come true.

Whether it's a young man saving for a house of his own. Or an older man looking forward to a comfortable retirement. Or a little girl dreaming of becoming a doctor some day..

Unit Trust has schemes to meet every need. Whether the need is for high growth or liquidity. Whether it's tax benefits or good returns coupled with insurance cover.

People know that with Unit Trust, they can get what they want. That is why the number of Unit holders is going up so spectacularly. To over 33 million today. Most of these people are small savers. They come from every part of the country. They come from every walk of life. They have different needs, different dreams.

But they share the same abiding confidence in Unit Trust. Living up to this confidence is what keeps us going. And growing.

UNIT TRUST OF INDIA
For your better tomorrow.

Vol XXIX No 30 July 23, 1994

Role of Labour Institutions

The presence of trade unions and protective labour legislation has been characterised as inhibitive of employment, growth and efficiency especially in the context of economic liberalisation and the consequent globalisation. Traditional labour institutions (such as, caste and gender-based) have been opposed in the name of efficiency and growth, even as social and political struggles for affirmative action in the labour market in favour of socially disadvantaged groups have gained momentum. Are these arguments supported by empirical evidence? **1938**

Hidden Treasures

While the official trade between India and Sri Lanka is bewilderingly paltry given the long-standing economic relations between the two countries, contraband trade and unofficial capital transfers between the two countries is large, though unestimated. Will the lifting of barriers to the movement of goods, services and capital between the two countries yield returns to the two governments? **1948**

Democracy in Practice

Indian electoral democracy has functioned as a means of recanalising the forms of traditional power and property into modern channels. And therefore, the violence of the armed landlord factions has fitted neatly into electoral combat. The sanctity of the elected representatives has lent legitimacy to the erstwhile armed lord. **1903**

Not Good Enough

The proposed Indian Forest Act based on the forest policy resolution of 1988 makes a departure from the colonial commercially-oriented, bureaucratic forest management practices. But the rights of forest dwellers remain ill-protected. **1909**

Selective Involvement

It is ironic but true that those who argue for minimum intervention of the state in economic activity are often strong advocates of the state taking a firm hand in maintaining law and order especially with reference to militant trade unions, mass actions, etc. **1929**

A First Step

Having decided to allow the International Red Cross to visit Jammu and Kashmir, the government should now take the international organisation's recommendations seriously. **1897**

In Exile

Globalisation has accentuated the weaknesses in Tibetan Buddhism in exile and has contributed to the growing demand for reform. **1926**

Water for All?

The Narmada Project confers bounties on a small, wealthy section of Gujarat's population to the detriment of large masses of those eking out a subsistence livelihood in the forests which are being submerged. Is there no alternative? **1957**

Traditional small water bodies not only have a tremendous irrigation potential but are also ecologically sound and could provide water supply to rural and urban populations. **1936**

Uneven Growth

Banking services have made much progress over the year, but regional distortions persist. **1925**

A Different Stroke

A nationalised health service could provide adequate and efficient health care for all at affordable cost But the concept has never been properly explored. **1913**

Reversal

While the BSP may still retain its dalit following, it may not have the same edge in state politics. **1907**

LETTERS TO EDITOR

Dangerous Proposal

NOW that the Indian government is bringing a new 'Plant Varieties Protection Act', it is indeed time to discuss how farmers' rights can be protected. But Suman Sahai's article (June 25) ignores one of the most dangerous aspects of the government's proposal. This is its claim to bring *all* the germplasm (biodiversity) in the country under control of the central state.

The fact is that farming communities, especially minorities and indigenous peoples, have been exploited and looted as much by their own traditional elites and national states as by multinationals. This has gone on through the taking of forest resources, through the confiscation of land under land acquisition powers for dams, urban expansion, defence projects or cheap sale to foreign companies. And now, on top of claiming land, water and forest, the Indian government is staking its claim to germplasm.

We cannot afford to be naive about the 'public sector'. The state has *not* in the past "produced seed for the farmers of Kalahandi as much as for the farmers of Leh". In the name of "subsidising" farmers and "helping the rural poor", it has rather by various pricing and trade and production controls utilised agricultural surplus for a heavy industry, urban-bureaucratic focused development. Its "public investment" has fostered irrational large irrigation projects and a capital-intensive chemical agriculture; the rural poor, indeed the entire rural sector, have been marginalised. Until forced to by GATT and 'globalisation', it has shown no interest in protection of biodiversity or farmers' rights.

This does not mean the state has no role to play, but we should not expect its class/caste character to change very much in the future. It is necessary to fight specifically for the rights of local communities over biodiversity: community rights (ownership and control) should be agreed to over germplasm, as well as over land, water and forest resources. The 'ignorance' and 'naivety' of farmers or adivasis is often used as a justification for 'protection' by a powerful 'ma-bap' state. Local communities can hire lawyers to defend their interests, they can give a share of royalties as taxes to the state or pay for public services—but we should fight the government proposal which gives the centralised state full control over germplasm as well as over utilisation of whatever resources and royalties come from this.

Incidentally, it is somewhat ironic that those who were most adamant against GATT on the grounds that it would 'force us to patent seeds' are now pointing to the openings that exist to evolve a truly *'sui generis'* system! The government should not use these openings to increase the powers of a centralised bureaucracy; instead we should go in the direction of empowerment of local communities.

HRD Expenditure

IN his letter (June 11) Paul Teunissen, while commenting on the article 'Fiscal Correction and Human Resource Development Expenditure at Central and State Levels' by S P Gupta and A K Sarkar (*EPW*, March 26), mentioned that the annual growth of HRD expenditure of the central government at constant (1980-81) prices has not been affected during the fiscal stabilisation years 1991-92, 1992-93 (RE) and 1993-94 (BE).

In justifying the statement he has cited some numbers which do not tally with figures given in Table 2 of the article. The critic has pointed out that the combination of the realised expenditure of HRD for the first two years 1991-92 and 1992-93 and the planned expenditure of the last fiscal year shows a 15 per cent rise in real terms of plan and non-plan HRD expenditure. According to the figures given in our study, the rise of HRD expenditure, taking the three years in question, is only 9.0 per cent. Taking into account the revised figures given in budget 1994-95 now available, there is a marginal rise at 9.5 per cent. It is not known how the critic has worked out the figure of 15 per cent rise in real terms.

The purpose of the study was to observe the annual growth rate of HRD expenditure at central and state government levels to trace the emerging tendency. The growth of annual central government HRD expenditure as shown in Table 2 of the study rose from a negative base of -7.71 per cent in 1990-91, to 5.3 per cent in 1991-92 which in reality is a marginal increase after base correction. In 1992-93 (RE) the growth rate is only 0.47 per cent over the previous year. In the year 1993-94 (BF) the growth rate is 8.78 per cent over the low base of growth of 0.47 per cent of 1992-93. However an attempt has been made to increase the level of HRD expenditure in the year 1993-94 in view of erosion of HRD expenditure in the earlier two years. These figures over the last three years support our statement that HRD expenditure in the central sector has been affected during the stabilisation period.

In recent years we observe significant variation of budgetary data at three different stages—the budget estimates, the revised estimates and the actuals. The figures given in the study have now undergone revision. The actual figures of five years would give a definite conclusion. In our study we attempted to discuss the tendency of the annual growth of HRD expenditure at constant prices for those years for which data were available at thepoint of time. We expect that expenditure allocation for HRD will increase in future years to reduce the social cost of fiscal stabilisation process.

A K SARKAR

New Delhi

ECONOMIC AND POLITICAL WEEKLY

Tarnished Jubilee

THE balance sheet of 25 years of bank nationalisation undoubtedly provides a telling lesson: the changes in the financial system, however revolutionary, are not very effective when the economic environment is inherently unbalanced and unequal, both regionally and functionally, and when structural changes in the real economy are not geared to correcting those imbalances and inequalities in an effective manner. Even so, what has been achieved under the public sector dispensation in commercial banking in particular and in the financial system generally, even in the midst of structural disabilities of the Indian economy, is commendable. While this progress has brought in its trail manifold problems—inefficiency, weak staff and financial structures, low profitability, large non-performing assets, bureaucratic interferences, etc—in their operations, the financial infrastructure created across the country over the years provides the necessary foundation so important for the more rapid and diversified development of the Indian economy.

The banking infrastructure existing today with its massive network of branches and staff support—comparable to the Indian railways and postal network—could never have been built by private sector initiative. Nor would the deposit base of the commercial and co-operative banking system, touching Rs 3,65,000 crore or roughly about 42 per cent of GDP at current market prices, ever have been created but for public sector banks. Despite the many problems, banks have been funnelling in additional deposit money of 17 to 18 per cent every year since the nationalisation of major banks in July 1969. The increase was over Rs 50,000 crore (16.9 per cent) during 1993-94 and it is likely to be more than Rs 62,500 crore during 1994-95. This has been in spite of the fierce competition from non-banking institutions and the capital market, and the lowering of rates of interest on bank deposits. The public ownership of banks has contributed a great deal to the stability and risklessness of savings in the form of bank deposits—features which are of great importance to the small savers. Bank deposits still contribute about 36 per cent of gross savings of the household sector in financial assets. If the Unit Trust of India's growth has been phenomenal, it has not only been due to the higher effective yield rate offered but also because of its public sector character. If the financial system has to remain stable, generate more savings, achieve a more diversified deployment of those funds both regionally and sectorally and continue to play a role in economic development, the public ownership character of the system needs to be retained and nurtured. Given managerial and operational freedom and dynamism, this can be entirely consistent with commercial or financial viability of the institutions constituting the system.

The philosophy and principles which had guided the nationalisation of banks—wider territorial and regional spread of branch network, faster mobilisation of financial savings, reorientation of credit deployment in favour of small and disadvantaged classes and elimination of bank credit pre-emption by the large borrowers, removal of control on banks by business houses, professionalisation of bank managements, and the provision of adequate training and reasonable terms of service for bank staff—all these were grounded in strong economic reasoning which is still valid. The problems and aberrations which have crept into the functioning and performance of banks can be resolved by a more thoughtful approach to managerial freedom and management restructuring with clarity in regard to corporate goals and objectives with checks and balances to eliminate bureaucratic interference. The *modus operandi* now being advocated to bring about a more efficient functioning of the banking system, namely, unbridled competition, is both narrow and naive in its approach and construction. Take the case of priority in computerisation. Adopting the culture and techniques of foreign banks, public sector banks are being pushed to undertake computerisation of frontline customer operations while the crying need is for computerisation of the back-up operations concerning accounts and inter-branch reconciliations.

A more telling case is that of the authorities' lukewarm attitude towards what as come to be known as twin constituents of social banking, namely, spread of branch network and priority sector lending. This attitude is sure to prove extremely short-sighted. Many banks in southern India, for instance, were vying with one another to grant credit for sectors and purposes which broadly constitute the priority sector; the proportions of such advances in their total bank credit ranged from 55 per cent to 60 per cent. When these banks were catapulted into the status of national banks where the competition was for bigger accounts, the share of their priority sector advances dwindled to as low as 35 per cent, far below even the 40 per cent ratio prescribed by the government.

The adverse consequences of this phenomenon have both regional and sectoral dimensions. The reasonably high level of industrial growth of over 8 per cent per annum attained during the 1980s was, to a great extent, contributed by the increased tempo of activities in manufacturing industries and other informal sectors in rural, semi-urban and small-town

centres. The contraction in assistance for priority sector advances by banks is sure to hurt the growth of those centres which have otherwise a significant potential for generating non-farm employment and production activities. More than 40 per cent of bank deposits are generated in such areas including small-size urban centres. Semi-urban centres produce about 20 per cent of bank deposits, but the most disquieting aspect has been that the banks have been increasingly desisting from expanding their lending activities in such areas. As against the prescribed target of 60 per cent, the credit-deposit ratio of these semi-urban branches, which had ranged from 52 per cent to 54 per cent during the 1980s, declined to 47.5 per cent in March 1992 and further to as low a figure as 39.9 per cent in March 1994. While it is true that the economies of semi-urban centres have trading as a dominant profile, such a sharp reduction in the proportion of deposits deployed as credit in these centres is indicative of an acutely biased credit delivery system which is hindering the goal of a more diversified pattern of development. Similarly, the reluctance of banks to expand lending business in rural and semi-urban areas would appear to give the impression that many of the existing bank branches in such centres are uneconomic, which, in turn, would make the banks even more reluctant to expand their branches.

This distorted attitude to banking development originates from the overriding strategy of competition now constituting the government's banking policy. The contention that low yield on advances for informal sectors is driving the banks from such lending is not entirely correct any more with 12 per cent interest even for small loans up to Rs 25,000 and with substantial tax concessions on rural lending, unless the banks prefer to seek a decidedly regressive nature of interest incidence on bank advances in general. In effect it is the bank's attitudinal bias against small borrowings and operations in rural and semi-urban areas which plays a role in preventing lendings to such parties rather than the low yield on such advances.

Against this background, what is called for now is a reassertion of the goals and strategies of bank nationalisation, ensuring that the banks do not jeopardise their own and the domestic economy's long-term interest. The operations of the regional rural banks (RRBs) and the co-operative banking system, while they may have some role to play in some specific areas, are too narrow in size to serve the sizeable credit needs of rural and informal sectors. Commercial banks will have to strengthen and expand their activities in these areas, if necessary through aggressive refinance facilities from the National Bank for Agricultural and Rural Development (NABARD) and the Small Industries Development Bank of India (SIDBI). There is no alternative to continuing a policy of promoting branch banking and pursuing directed credit arrangement. Secondly, banks will have to desist from getting involved excessively in unproductive or non-functional activities such as, investing, as well as lending against company shares and indulging in treasury operations which are being bred by the current encouragement to competition and profitability. The craving for 'other incomes', that is other than lending income, by public sector banks in competition with foreign banks and the proclivity to possess company shares in their investment portfolio have dangerous implications. They may jeopardise the stability of the banking assets, and worse, may serve as a source for financial scandals of the type that we have recently experienced.

A more fundamental issue that should be resolved in the current stage of development is the need for providing a powerful thrust to decentralisation in the banking structure. This process received a serious jolt after bank nationalisation, with banks having local specialisation acquiring national status and becoming impersonal organisations. The recent stipulation that new private sector banks should be headquartered in those centres which are devoid of banking has turned out to be a facade with the new banks preferring only nameplates in such centres while seeking plum business essentially in metropolitan cities. Likewise, the proposal to merge all the subsidiaries of State Bank of India (SBI) with the latter or into a separate giant bank smacks of a further process of centralisation. In this regard, the global ambitions of some of the existing private sector banks need to be curbed and they, along with the SBI subsidiaries, should be made to retain local characteristics and concentrate on serving the banking needs of their respective states and regions. Also, preference should be given to proposals for new private banks which would effectively operate in states devoid of banking headquarters, namely, Uttar Pradesh, Bihar, Madhya Pradesh and Orissa. The new approach should scrupulously observe the time-tested principle of not allowing manufacturing interests or even giant financial interests to establish banks in the country. Considering the fact that the country is already overbanked at the national level, it is advisable to encourage the private banks—new as well as the old ones—to be professionally owned and run, to remain small and retain local characteristics.

POLITICS

Criminals' Last Resort

NEWSPAPER reports about happenings in certain parts of India during the last few weeks tend to reinforce the impression that any criminal seeking immunity from prosecution can become either an MLA or a police officer.

Bihar, of course, takes the cake. But New Delhi is not far behind. Right in the heart of the capital, in a five-star hotel, on July 1, the high-profile Punjab police chief KPS Gill presided over a session of journalist-bashing conducted by his cops. The same day, in the Bihar state assembly, an MLA was busy beating up the state's minister of health. According to one estimate, among the members of the Bihar legislature, there are at least 20 MLAs, including a minister, who can claim an impressive list of crimes, ranging from murder to kidnapping. Not satisfied with such exploits outside the legislature, they have now begun to extend their activities within its precincts. The hero of the July 1 incident was Ranvir Yadav, an independent MLA, who is alleged to have been the brain behind a massacre of 13 'dalits' in a Bihar village in 1986. Yadav's grouse against the minister whom he assaulted was that he had refused to grant him his request for the transfer of some official. At around the same time, another MLA, Anand Mohan Singh (whose wife, Lovely Singh, recently won the Vaishali Lok Sabha seat, defeating the Janata Dal candidate) created a scene by entering the house, rushing to its well, overturning tables, uprooting microphones, swinging chairs and throwing papers all around. All this happened in front of the speaker, while chief minister Laloo Yadav was replying to the debate on the general budget. Singh's grouse was that two of his supporters in his wife's Vaishali constituency had been kidnapped and murdered by a ruling party MLA. Ironically, Singh himself has quite often been accused of similar crimes. Neither Yadav nor Singh has any regrets and is in a mood to apologise. While Yadav displays a cavalier attitude, saying "it's my style" (as quoted in a news report), Singh defends his act on the ground: "If there is bloodshed in the state, it is bound to stain the floor of the house" (again quoted in a news report).

Coming fast on the heels of the Bihar assembly events, on July 6 in the Madhya Pradesh legislative assembly a BJP MLA, Ram Dayal Prabhakar, allegedly "under the influence of liquor", snatched the sten-gun of his bodyguard and threatened to shoot the speaker of the assembly in the latter's chamber. His complaint against the speaker was that he had failed to allot him an 'E' type bungalow (apparently luxurious accommodation, reserved for senior MLAs).

Although the BJP has finally suspended Prabhakar from its legislature party, the unseemly incident exposes the BJP's lack of scruples in selecting its candidates.

The incidents related above were confined to the four walls of the august houses. The behaviour of our legislators outside these precincts keeps providing spicy staple for the press all through the year (the latest one involving a Haryana minister's misbehaviour on an Indian Airlines flight). After all this, the last laugh should be reserved for good old Lenin. It was he who used the term 'pigsty' (surely 'unparliamentary', according to our rules inherited from the colonial regime) to describe legislatures in so-called democracies.

BIHAR

Deepening Fissures

IT is over a month since the formal split in the Janata Dal parliamentary party in which 14 MPs formed a separate group headed by George Fernandes, now called Janata Dal (G). The leaders of the breakaway group expected similar splits in the state legislature parties, and their expectation did not prove to be totally unfounded. The most noticeable effect of the split in the central Janata Dal manifested itself in UP where a number of MLAs walked out of the parent group. However, to the chagrin of the leaders of the breakaway Janata Dal, they did not join the new group; they defected to the Samajwadi Party of the chief minister Mulayam Singh.

This behaviour of the former Janata Dal MLAs in UP provides a clue as to why the government of Laloo Prasad Yadav in Bihar is still intact—despite the fact that 10 of the 14 breakaway JD MPs represented Bihar, and that one of these MPs, Nitish Kumar, who has emerged as one of the leading candidates for the post of chief minister in the state, seems to have been the most active agent behind the split in the Janata Dal. Clearly, a major split in the Bihar Janata Dal has not yet taken place because the party MLAs in the state belong to the ruling group. Other factors which seem to have contributed to this behaviour of the state JD MLAs are the decision by the CPI, CPI(M) and other state parties not to withdraw their support to the government in the wake of the JD split, and the fact that Laloo Prasad Yadav still enjoys a large measure of popularity among the state OBCs, especially yadavs towards whose appeasement the machinery of his government has particularly been geared.

Laloo Prasad Yadav's leading rival Nitish Kumar is a kurmi, a bhumihar caste not part of the state OBCs, and he has been campaigning for the inclusion of the kurmis in the OBCs' list. This fact may well have consolidated the support for Laloo Prasad among the yadavs and other backwards in the state populace whose numbers are not insubstantial. The OBC MLAs of the state Janata Dal cannot be expected to be unaware of these facts. Further, the next assembly elections in the state are slated for March 1995, a clear eight months away, and, if past trends are any indication, the JD members in the state may begin to weigh their options only towards the eve of the elections.

Does this mean that the Laloo Prasad government is firmly entrenched and that there is no immediate likelihood of its fall? If one were to go by the recent resignations of three senior ministers from the Laloo government—one of whom joined the Samajwadi Party and the two others have declared their loyalty to the JD(G)—there are deep fissures among the leadership of the state Janata Dal. The two ministers who have walked over to the JD(G) ostensibly resigned in protest against the alleged attack on the "senior socialist leader" George Fernandes at Muzaffarpur by JD activists of the Laloo Prasad camp. If JD(G) can manoeuvre similar senior level walk-overs from the Laloo Prasad group in the immediate future, it may impel a number of lower-level JD members to follow their step. A factor that is likely to come to the rescue of Laloo Prasad Yadav is the requirement that only one-third members of a legislature party can separate out to form a new group without losing their membership in the assembly. A lot will depend too on the continued support of the left and other regional parties to the Laloo Prasad government. It is improbable that the JD MLAs, even if they are discontented with Laloo Prasad for one reason or another, will risk their membership of the house and, in the longer run, their political future, by aligning themselves, so early before the elections, with a party whose base among the populace of the state is yet to be tested.

TELECOMMUNICATIONS

Limiting Conditions

THE government is taking its time over establishing guidelines for the entry of the private sector in basic telephone services. After the policy was announced, two committees were set up, one headed by the D Sen Gupta of the telecom division of the ICICI and the other by the Telecom Commission member M G Joshi, to look into and evolve guidelines for the entry of the private sector. Both these sets of recommendations are now with the government which has reportedly submitted them to the law ministry. But clearly the delay in announcing the guidelines is not only because of procedural hassles.

There is apparently little consensus on these guidelines within the concerned ministries which are being pulled in different directions by contending beneficiary lobbies. The telecom policy, it may be recalled, made provisions for private sector participation on telephone services on an agreed tariff and revenue sharing basis, among other far-reaching changes in the sector. While guidelines were yet to be formulated, there was the promise of a minor eldorado for private parties, Indian and especially foreign.

The two committee reports appear to have stunted this hope to a limited extent. The major contentious issue was the criteria to be used for demarcating and, therefore, limiting the extent of participation of the private sector. The Sen Gupta committee has recommended that only secondary switching areas with at least 60 per cent rural population and a potential for 1,00,000 lines should be opened to private parties. Exclusive operation is to be allowed to the licensee in the area for a period of five years with a growth potential of 3,00,000 lines in contiguous reserved areas. Initially only a limited number of areas are to be identified for private sector entry. The committee demands transparency in the operations of the licensee regarding cost structures, operations and service conditions. There is however, no provision for the government taking over services during an emergency, only that the former can direct the operator to provide certain services. It has also recommended the mandatory take over of DoT employees and assets in the area by the private licensee. Further, it has recommended foreign equity participation of 51 per cent and other conditions as per existing legislations. A separation of licensing, regulation and operation is to take place by constituting autonomous bodies. The Joshi committee endorses most of the recommendations of the Sen Gupta committee. It, is, however, in favour of restricting equity participation to 40 per cent. The committee has pointed out that this is so in several countries, and in China equity participation is restricted to 16 per cent.

Given these recommendations, it is obvious why the government is dragging its feet. There are pressures, especially from the US companies, that equity participation up to 51 per cent should be allowed and that the conditions for entry must be made more flexible, as for example that the proportion of rural population in the secondary switching areas should not be a limiting factor. On the other hand, telecom employees and industry associations like the Telecom Equipment Manufacturers Association of India had opposed 51 per cent equity participation.

Interestingly, these changes in the telecommunication sector in India are taking place in an international environment where the responsibility for basic telephone services has been steadfastly retained by the state. In many countries, including Singapore and France, basic services have not been opened up for private participation. Even in the UK, New Zealand and Germany, which are currently restructuring their tele-

communications network, basic consumer services are being retained by the state.

SRI LANKA

Uncertain Days

IF president D B Wijetunga hoped to catch the opposition on the wrong foot when he dissolved the parliament on June 24 and announced fresh elections in August, six months ahead of schedule, the idea seems to have backfired. For it is the UNP rather than the SLFP, the leading constituent of the opposition grouping the People's Alliance, which is showing confusion. As reports about the filing of nominations trickle in, there are indications that the UNP's list of candidates is causing dissension among the rank and file, aggravating the already tense situation in the party. Creating further ripples, Hema Premadasa, widow of the assassinated president, who had reportedly refused a ticket, came to the filing office only to find that her name had been excluded from the UNP's list of 23 candidates for Colombo's 20 districts. In the Sri Lankan system there are no candidates for each seat, but each party has to file a list of candidates for each district. Apart from the two major parties, the others in the fray are the Nav Sama Samaj party in alliance with the JVP and other like-minded parties, and from the north, the Muslim Congress, the TUNF, a combination of PLOT, TELO and EROS, and other Tamil parties.

The president's calculations in announcing elections ahead of schedule are obvious enough. The presidential elections are in November and the party which is in office has a better chance of winning those polls. However, the UNP received a severe rubbing in March when in a regional election in the south, the People's Alliance (PA) devastated the UNP opponents after a spectacular campaign led by the SLFP's charismatic leader Chandrika Kumarantunge. Within the UNP, there have been rumblings of discontent. While it managed to wean away as many as six legislators from the SLFP, just before the dissolution of parliament, it has subsequently lost its star candidate and long time member, Gamini Fonseka who has crossed over to the PA. While Fonseka will not contest the elections, he has been included in PA's national list. (This is a list of candidates which each party may nominate to parliament.) The president has attempted some reorganisation with a view to strengthening the party, but these have not gone down well with all. For instance, the induction into the cabinet of Gamini Dissanayake, who had gone over to the opposition for two years before he made a come back, has not been welcomed. Nor has the removal of Sirisena Cooray from the party secretary's post although he continues to be in the cabinet.

It is not even as if Wijetunga has been able to present to the people the promise of better times ahead. His recent budget, while it included a number of hand-outs such as low-priced bread, pension schemes, was in fact a populist budget without much substance and little thought to a long-term economic strategy. Another factor is the Tamil question—Wijetunga's Tamil bashing in the last local elections in the south found no takers. The declaration of elections in Jaffna has been opposed by many parties. They point out that large sections of the northern district comprising Jaffna and Killinochchi are very much under LTTE control, barring small areas and a string of islets off the peninsula which have been cleared by the army. This would mean there were only about 6,000 voters in the cleared areas instead of the 6,00,000 voters in the area. While most of the Tamil parties have filed their nominations, LTTE has not made its presence felt in any way in the election process so far. It is not clear either whether it has called for a boycott of the polls, but in any case, it would be impossible for parties and their candidates to move about for campaigning in the LTTE-held areas.

The situation is not, therefore, all hunky-dory for the UNP as the president hoped it would be when he dissolved the parliament and announced early elections.

PALESTINE

Seeking Capital

THE violence at the Gaza-Israeli border crossing of Erez on July 17 in which two people were killed and several wounded highlights another dimension of the problems faced by the Palestine national authority, namely, the economic. The violence occurred when Israeli soldiers manning the check-point refused to allow the Palestinian workers from the Gaza Strip to cross over into Israel. It is not difficult to make out why it led to a riot by the workers, for about 25,000 of them work in Israel and cross over everyday. It is likely that these 25,000 do not form part of the 60 per cent of the Gazans, out of the total 8,50,000, who are without work. While these figures are an ample evidence of the criminal neglect of the Palestinian economy under Israeli occupation, they also point to the enormity of the task of the autonomy government which has to build this economy almost from the scratch.

The most difficult part of the task is to muster enough capital to invest in the fledgling Palestinian economy. Given the fact that Palestine was till now and still continues to be in part a colonial territory, most of this capital has to be secured from outside. Although a promise of such capital was not built into the accord which brought the autonomous status to selected Palestinian territories, the leading broker to the accord, the US, had assured the PLO that it would use its influence to help the new Palestinian authority in this matter. So far about $ 2.4 billion of international aid has been pledged for Palestinian economic development over the next five years including $ 1.2 billion by the World Bank, but already Yasser Arafat has complained that these funds have been slow in coming. Part of the reason is that the PLO is apparently resisting control of the aid givers in the matter of the expenditure of this money, something on which the latter have been insisting. As a World Bank official said recently: "The chairman [Yasser Arafat] does not want to be accountable... [But] we will not replenish these accounts until we get appropriate vouchers." Arafat, on his part, has asserted that he "will never accept controls on the money". He seems to be aware of the dangers to which such foreign controls can lead. As he added: "We didn't finish military occupation to get economic occupation."

However, there is no evidence so far that these assertions are anything more than mere political hyperbole. Certain actions of the PLO, in fact, indicate just the contrary. One of these is the appointment by Arafat of the Strategic and Development Policy Advisors (SDPA), a New York and Paris based institute of experts in finance, industrial policy and economic development, as advisors to the Palestinian administration. The SDPA, it may be noted, has been organised and will be headed by a French-American Gabriel Banon, an industrial development advisor to the late French president Georges Pompidou, and it will work closely with Hogan and Hartson, a law firm, and TAMS, an engineering firm, both of which are American. Professedly, the PLO has appointed the SDPA not only as consultant on economic policy matters, but also to negotiate and liaise on its behalf with international financial institutions and firms investing their money in Palestine, so that their control over Palestinian economy can be warded off. Nor can one fault PLO, in this era when cross-border intellectual expertise is available at a cost, for engaging a foreign institute to advise it on policy matters and to negotiate on its behalf. However, intellectual advice, especially when it comes from the experts belonging to the capitalist and the former imperial countries, is never free of the ideological baggage of a certain kind; nor, indeed, can it be said to be completely free of political motivation. There is a danger, therefore, that in its ostensible effort to keep off neo-imperialism of one kind, the PLO may fall victim to neo-imperialism of another kind: that of the economic and financial experts from the 'first world'. Already, while making a reference to the SDPA, Arafat has talked of building a "free and efficient economy". For those who have looked at the PLO as an organisation with a progressive orientation, these words evoke uncomfortable associations.

Alang Marine

ALANG MARINE, an existing profit-making company which originally acquired an existing division of Chowgule and Co, is today one of the largest private sector shipyards in the country and is located on the western coast of the country with facilities for ship building and ship repairs under one roof. The yard enjoys proximity to the major coastal highway connecting Bhavnagar to Okha, via Veraval/Porbandar which ensures intrinsic advantages of a wide sea frontage, navigability and proximity to user locations. The existing infrastructure has the capacity for repairing and building ships up to 4,000 tonnes deadweight and can demolish ships up to 40,000 light displacement tonnage in addition to being able to undertake fabrication jobs for the offshore and port industry. The company is entering the capital market with an offer for sale of 7,51,500 equity shares of Rs 10 each at a premium of Rs 30 per share. The issue is being made to enable it to enlist its shares on the stock exchanges. The share offer is being made by the promoters whose stake in the company will stand reduced to 75 per cent after the issue. The public issue which opens for subscription on July 25 will be lead managed by Weizmann.

Tainwala Polycontainers

Tainwala Polycontainers, promoted by Tainwala Chemicals and Plastics and Ramesh Tainwala, is setting up a plant for the manufacture of extrusion blow moulded high molecular high density polyethylene (HMHDPE) containers (of up to 220 litres capacity) with a capacity of 2.5 lakh numbers per annum. HMHDPE containers are used for packaging of chemicals, dyestuffs, bulk pharmaceuticals, explosives and petrochemicals and have several advantages over conventional mild steel drums because they are lighter, have better resistance to chemicals, and are more cost effective. The Rs 13.2 crore-project is to be set up in technical collaboration with S T Soffiaggio Technical Sri of Italy at Silvassa, an 'A' category backward area, in the Dadra and Nagar Haveli area. The backward area status of the project will ensue in exemption from sales tax for a period of 15 years and from tax for a period of five years. The project is to be financed through equity capital of Rs 7.8 crore and term loans of Rs 5.4 crore. Commercial production is expected to commence in December 1994. To part finance the project the company is entering the capital market with a public issue of 23,50,000 equity shares of Rs 10 each at par. The issue will be open for public subscription on August 1 and will be lead managed by SCICI and Indbank Merchant Banking Services. The promoters stake will stand at 70 per cent of the Rs 7.8 crore post issue equity capital.

Ranisagar Cement

Ranisagar Cement Company, which has been promoted by D S Bhandari and S P Sehgal, is setting up a fully integrated project to manufacture 200 tpd of portland cement. The first phase of the project, which envisaged setting up 75 tpd of the capacity, has already been completed and commercial production commenced in March this year. The project is located at Ranisagar between Ajmer and Beawar and is to be financed through equity capital of Rs 6.5 crore, a term loan of Rs 1.0 crore from State Bank of Hyderabad, a deferred payment guarantee of Rs 47 lakh from the Bank of Rajasthan and a state subsidy of Rs 20 lakh. To part finance the project the company is entering the capital market on August 8 with a public issue of 42,80,000 equity shares of Rs 10 each at par.

Bommidala Aquamarine

Bommidala Aquamarine, promoted by the Bommidala group of Andhra Pradesh, is setting up a shrimp farm in the Nellore district at a total cost of Rs 10.3 crore. The company has already completed the first phase of the project which involved 12.5 hectares of shrimp farm and is now planning an integrated project which will have facilities for an in-house hatchery, farm and processing plant with its own marketing set-up. The project which has been appraised by Vysya Bank is to be financed through equity capital of Rs 6.2 crore, term loan of Rs 4.0 crore from Vysya Bank and subsidy of Rs 2.0 lakh. To part finance the project the company is entering the capital market on August 10 with a public issue of 46,74,100 equity shares of Rs 10 each at par

Bagwe Udyog

Bagwe Udyog is a merchant exporter and manufacturer of copper, brass and other copper alloy tubes. The company now proposes to set up a 100 per cent export-oriented unit as part of its expansion project for augmenting its manufacturing capacity of redrawing copper and copper alloy tubes from 1,155 mtpa to 2,955 mtpa. The project estimated to cost Rs 12.2 crore is being set up in the Raigad district about 80 km from Bombay. The project enjoys financial and equity participation by Videocon Leasing and Industrial Finance (VLIF) and is expected to commence commercial production by October 1994. The company is already exporting its products to the US, UK, UAE, Taiwan and Bahrain. To part finance the project the company is entering the capital market with a public issue of 13,79,100 equity shares of Rs 10 each which will be offered at a premium of Rs 10 per share. The issue will be lead managed by SBI Capital Markets and VLIF.

Liberty Shoes

A part of the Rs 100 crore Liberty group of companies, Liberty Shoes is entering the capital market on August 9 with a public issue of 12,70,000 equity shares of Rs 10 each which will be offered at a premium of Rs 89 per share. The issue is to part finance the company's plans for setting up a project for the manufacture of 6,00,000 pairs of leather shoes and 9,60,000 pairs of non-leather shoes. In addition to this project, which is estimated to cost Rs 23.6 crore and is to be set up in the Karnal district of Haryana, the company also proposes to open premier leather goods showrooms in major cities.

HEG

The largest exporter of graphite electrodes in the country accounting for 55 per cent of total graphite electrode exports from the country, HEG has been receiving the prestigious 'Capexil' export award for the last eight years consecutively. A multiproduct company, HEG belongs to the Rs 700 crore LNJ Bhilwara group and is also engaged in the manufacture of sponge iron, textiles and cotton knitwear besides carrying on oil drilling operations. The company is now undertaking a modernisation-cum-expansion programme at a total outlay of Rs 200 crore which includes Rs 25 crore for the installation of a modern fuel efficient baking furnace and an impregnation shop for the graphite plant, Rs 22 crore for a 'waste recovery system' for the sponge iron plant and Rs 25 crore for installation of 9,216 additional spindles. An additional Rs 65 crore for setting up a 13 mw hydel power plant at the Tawa Hydel project under the advice and guidance of Hydro Quebec International of Canada is also in the pipeline. Further the company plans to add another 50,000 spindles at a cost of about Rs 170 crore which is expected to be completed in 1995-96. The company plans to raise funds for its modernisation-cum-expansion project through a Euro-issue or through private placement to foreign institutional investors.

Fiscal year 1993-94 has ended with an industrial growth of 3 per cent as against 2.3 per cent in 1992-93 and (-) 0.2 per cent in 1991-92. Electricity generation has grown by 7.3 per cent and manufacturing by 2.2 per cent. Within manufacturing, capital goods and consumer non-durable goods have shown a decline in output. At the two-digit category level, food products, some varieties of textiles and electrical machinery registered decline in production. While the inflation rate has again moved up to 10 7 per cent, there has occurred some moderation in monetary growth following reduced RBI credit to the centre and reduction in non-food advances which have balanced the continuing injection of liquidity through accretion of foreign assets.

SREE MEENAKSHI MILLS

High Raw Material Cost

SREE MEENAKSHI MILLS, which had accumulated losses of up to Rs 5.4 crore, has managed to turn around in 1992-93 by posting a net profit of Rs 50 lakh on a 14.5 per cent higher net sales. The company's operating profit more than trebled over the previous year and a smaller rise in interest and depreciation charges enabled it to post a profit during the year. However the company's margins remain at a low level with the textile industry going through a difficult phase. The fall in the cotton crop as compared to earlier estimates and exports of cotton coupled with an increase in consumption with increased spindleage in the industry as a whole led to a sharp rise in cotton prices which ruled high from February to November 1992. The company claims that its performance could have been better but for the slump in the domestic and international markets up to October 1992 and the high raw material cost which could not be absorbed by the yarn market. The hike in energy cost and wages in addition to the overall increase in input costs adversely affected the company's margins.

Production of cotton yarn, staple fibre yarn and polyester/cotton blended yarn and cloth was lower at 6,321 mt, 227 mt and 72.5 lakh metres, respectively, as against 6,778 mt, 356 mt and 77.7 lakh metres produced last year. Sale was also lower at 4,034 mt, 286 mt and 69.9 lakh metres of cotton yarn, staple fibre yarn and polyester/cotton blended yarn and cloth as against 4,139 mt, 314 mt and 75.7 lakh metres in the previous year. However, the company managed to improve net sales in value terms due to improved realisation on all its products.

Exports improved by 15.7 per cent over the previous year and the company's products were reportedly well received in overseas markets such as Morocco, Mauritius, USA, Turkey, Italy, Belgium and Bangladesh. It now plans to tap new markets like Israel.

Meanwhile, the company's modernisation/rationalisation scheme was expected to be completed in 1993-94. In order to increase its production capacity and flexibility the company plans to install 34 new ring frames which will be utilised mainly for the production of finer/export counts of cotton yarn. Further, the company has also diversified into multi-fibre yarns like polyester-viscose and acrylic yarns.

JAIN IRRIGATION

Rise in Sales

Jain Irrigation which went public in October 1988 has since come a long way with its net sales increasing more than 15 fold by 1992-93. The company's net sales rose by 78 per cent and operating profit by 61.9 per cent over the previous year. Engaged in the manufacture of micro irrigation systems encompassing irrigation through strip-tubing, emitters, jets and mini sprinklers the company produced 4,363 mt of biwall, polytube drippers and fittings, 245 mt of filters, filtration equipment, 10 mt of controllers, control valves, 1,340 mt of extruded, moulded and fabricated plastic goods and 285 moulds and dies in 1992-93. The company's extensive marketing efforts in new areas of central and eastern Indian states seem to have paid off with domestic sales soaring by 63.2 per cent to Rs 41 crore. Exports more than doubled to Rs 21.6 crore accounting for up to 34 per cent of net sales. The boost in exports was provided by the pvc foam/rigid sheets line started during the latter part of the year following the implementation of the company's expansion programme. The rise in domestic sales and exports to south-east Asia, west Asia, Europe and north America was despite adverse conditions prevailing in the domestic and international markets. A sharp rise in interest and depreciation charges somewhat checked the rise in profits and gross and net profit increased by 57.9 per cent and 49.8 per cent, respectively. The company raised the dividend rate from 21 per cent last year to 24 per cent.

The company's expansion programme which envisaged raising of capacity from 25,000 acres to 66,000 acres of irrigation systems was completed and a part of the newly installed capacity was utilised during the year. Further, it has also implemented the expansion of its 100 per cent export-oriented unit (EOU) by increasing the capacity for pvc foam/rigid sheets from 1,800 mt to 4,200 mt and that of injection moulded products from 150 mt to 300 mt per annum. The diversification of the 100 per cent EOU for manufacture of polycarbonate sheets which was under implementation was expected to commence commercial production in 1993-94.

Meanwhile, with the conversion of part 'A' of the 36,21,744 partly convertible debentures (PCD) issued in March/April 1992 into two equity shares of Rs 10 each at a premium of Rs 30 per share resulted in an increase in the company's equity capital to Rs 10.3 crore. The PCD issue was made to finance the company's expansion-cum-diversification plans.

For the year 1993-94 the company improved its performance further and notched up a net profit of Rs 13.3 crore on net sales of Rs 92.7 crore.

ITC CLASSIC FINANCE

International Dimension

Promoted by three wholly-owned subsidiaries of ITC, ITC Classic Finance (formerly Classic Financial Services and Enterprises), which has emerged as one of the leading non-banking financial companies in the country, fared well in 1992-93. While the company's total income increased by 67.1 per cent over the previous year, operating profit was higher by 69 per cent and despite a sharp increase in interest charges, net profit rose by 76.6 per cent. Encouraged by its improved performance the company raised the dividend rate from 31 per cent to 36 per cent in 1992-93. With offices in Bombay, Bangalore, Calcutta, Delhi, Hyderabad, Madras and Dubai, the company has established a national presence and added an international dimension to its business. Its Dubai branch provides investment advisory services, financial consultancy and facilities to Indian corporates to market their issues to NRIs. The company's collection of deposits improved from Rs 35.8 crore in 1991-92 to Rs 58.7 crore in 1992-93.

Engaged in the business of leasing, hire-purchase, capital market operations/investment advisory services, merchant banking, trade finance operations and OTC operations, the company recently entered the capital market with a premium rights-cum-public issue of equity shares (premium of Rs 50 per share for the rights issue and Rs 90 per share for the general public and others). The issue aggregating Rs 122 crore (including premium) which will increase the company's equity capital to Rs 30 crore (Rs 36.1 crore after exercise of warrants) was made to part finance its plans for growth, to strengthen its equity base and net worth in order to enhance its ability to leverage, and to invest in a few joint ventures: a proposed asset management company, a trustee company and a stock-broking company; the company's alliance with the Peregrine group has gone sour and the proposed joint venture has been scrapped.

For the year ended March 1994, as per its latest unaudited results the company has surpassed the projections made during its recent foray into the capital market by earning a net profit of Rs 17.3 crore on a total income of Rs 102 crore as against a projected total income and net profit of Rs 83.4 crore and Rs 16.5 crore, respectively. Following the deregulation of the financial services sector in the country, the company foresees good growth prospects for itself and projects its total income to touch Rs 136.4 crore with net profit at Rs 43.6 crore in 1994-95.

ROHIT PULP AND PAPER

Fall in Margins

Rohit Pulp and Paper, which is engaged in the manufacture of paper and paper board, secondary lead and secondary tin, saw a drastic fall in its profitability in 1992-93. While net sales increased by 14.3 per cent over the previous year, operating and gross profits saw a 19.7 per cent and 29.3 per cent fall, respectively, while net profit fell by more than 50 per cent. The sharp rise in cost of imported pulp and waste paper which resulted from the devaluation of the rupee and saw the import content of raw material rise from 28.6 per cent in 1991-92 to 41.2 per cent coupled with the steep escalation in the cost of other raw materials such as rice straw and bagasse (85 per cent), chemicals (26 per cent) and power (10 per cent), led to the fall in operating profit while a 12 per cent rise in interest cost led to fall in gross profit. A further 16.2 per cent rise in depreciation charges accentuated the fall in profit and even a 87.4 per cent fall in tax provision could not check the slump in net profit.

Despite an increase in production of paper and paper boards, which is the highest contributor to net sales, from 26,689 mt last year to 27,351 mt, operations were affected due to the shut down of the board machine for 13 days for modification. Moreover, though the metal division achieved a production of 2,277 mt of secondary lead during the year as against 520 mt of secondary lead in the five months of the previous year, realisation suffered due to a fall in domestic prices following a similar fall in international prices.

Meanwhile, the company completed the modernisation-cum-expansion of its pulp mill as also the second phase of the electrical switchyard renovation and modernisation and is now contemplating ways and means for increasing the capacity for manufacturing writing and printing paper and improving the product mix by manufacture of value added products. It is also examining the viability of installing high pressure boilers for co-generation of power.

The company's equity capital rose to Rs 2.4 crore during the year following the issue of equity shares on rights basis at a premium of Rs 60 in the ratio of two shares for every five shares held. With this though there has been an improvement in the debt-equity ratio, the company's book value which stood at Rs 73.2 last year has fallen to Rs 67.8 and earnings per share has fallen from Rs 8.8 to Rs 2.7.

For the year 1993-94 the company improved its performance by procuring its main raw material, rice straw, as well as imported pulp and waste paper at lower prices as compared to 1992-93 leading to a rise in net profit to Rs 2.1 crore with net sales rising to Rs 64.5 crore.

SHREYANS INDUSTRIES

Modernisation Pays

Shreyans Industries (formerly Shreyans Paper Mills), promoted by Vardhman Spinning and engaged in the manufacture of pulp and writing and printing paper, has failed to improve its performance in 1992-93. Despite a 55.8 per cent rise in net sales the company's net profit fell by 5.7 per cent over the previous year. The 45.4 per cent rise in operating profit was diluted due to the sharp increase in interest charges (up 101 per cent) and depreciation provision (up 48.4 per cent). The modernisation programme carried out at its paper division last year, however, proved beneficial with production of paper rising substantially from 14,581 mt to 19,164 mt and the reduced consumption of specific energy per tonne of production. The spinning unit which made its entry into the export market also saw a more than 100 per cent rise in production from 1,114 mt of yarn to 2,347 mt. Sales were also higher at 18,995 mt and 2,209 mt of paper and cotton yarn, respectively, as against 14,179 mt and 1,018 mt sold last year.

Meanwhile, the automation scheme for the paper machine was completed in July 1993 and the company expects this to give a boost to its performance in future through higher production levels and consequently higher profitability. The scheme for treatment of trade effluents which was under implementation was expected to be ready shortly. The company completed the commissioning of 22,320 spindles at its spinning division in March 1993 and the balance spindles were expected to be installed during 1993-94. To part finance the setting up of a spinning unit with a capacity of 25,000 spindles in the Ludhiana district of Punjab, the company had entered the capital market in 1991-92 with an issue of partly convertible debentures. During 1992-93 the company's equity capital rose to Rs 6 crore following the conversion of these debentures. The full impact of the working of the new unit is expected to be felt in the years to come.

The company plans to augment the capacity of its paper division in the near future and proposes to add certain balancing equipment in the spinning division in order to increase exports.

For the year ended March 1994, the company's net sales have improved to Rs 71.7 crore while net profit, as per the unaudited results, have risen to Rs 4.7 crore giving an earning per share of Rs 7.9 on an equity capital of Rs 6 crore.

International Red Cross and India

A G Noorani

The government's decision to allow the International Committee of the Red Cross to visit Jammu and Kashmir has earned it much credit. But the visit would prove futile if the committee's proposals for providing humanitarian services in the state are rejected.

THE International Committee of the Red Cross has submitted detailed proposals to the union home ministry for making available humanitarian services in Jammu and Kashmir,' Amit Baruah of *The Hindu* reported (May 31). This follows a week-long visit to the state in March by an ICRC team led by its regional delegate, David Delaproz. According to the newsreport, the ICRC "has sought regular visiting rights to detainees in jails and detention centres, permission for setting up medical outposts to aid the injured apart from organising programmes to provide specialised training for the security forces". This covers dissemination of humanitarian law among them. The proposals made on April 6 are being considered by the government of India.

One must hope that it will accept them. Its decision to allow the ICRC team to visit the state for a 'survey' earned it much credit, deservedly. A survey is futile unless it is followed up by provision of relief. It is absurd to suggest, as some do, that the medicines should be made available to local Red Cross societies for distribution. Everyone knows the problems this will create which are well known and best left unstated. If the proposals are rejected the credit earned will be dissipated.

In a talk with pressmen in New Delhi on June 5, David Delaproz revealed that the ICRC has submitted a set of proposals to the government of Pakistan for provision of humanitarian services in Pak-occupied Kashmir. An ICRC team had recently visited the area, he mentioned, soon after its visit to the state in March for 'survey' proposals. Proposals to both sides were communicated almost simultaneously. But the two sets are not necessarily identical (*The Statesman*, June 6).

Unfortunately for all its high fame and enormous respect for its manifest impartiality earned over decades of service, factual information about the ICRC is sparse. Civil libertarians ought to take keen interest. A lot of information about the organisation is available in its Annual Report for 1993. For instance, little is known about its services in tracing people separated from their families, known as the tracing activities. Throughout 1993 the ICRC's regional delegation based in New Delhi, which covers India, Bangladesh, Bhutan, Nepal and Myanmar, monitored the situation of some 1,75,000 refugees from Sri Lanka in some 130 camps in Tamil Nadu and, what is more, kept them informed of ICRC activities in their home country. "The ICRC continued to provide tracing services for refugees who had been separated from their families and to issue travel documents to various refugees temporarily residing in India and accepted for permanent resettlement in third countries."

As the report makes clear, in law the work of the ICRC is based upon the Geneva Conventions and their additional protocols and the resolutions adopted by International Conferences of the Red Cross and Red Crescent. Almost all states are bound by the famous four Geneva Conventions of August 12, 1949, which in times of armed conflict, protect wounded, sick and shipwrecked members of the armed forces, prisoners of war and civilians. On June 8, 1977 two protocols were adopted. They reaffirm and amplify the humanitarian rules governing the conduct of hostilities (Protocol I) and to extend the body of humanitarian law applicable in armed conflict which is *not* of an international character. India has ratified the Geneva Conventions but it has *not* ratified the additional protocols. The Annual Report reveals that during his visit to New Delhi on March 9 and 10, 1993, the delegate-general for Asia and Pacific of the ICRC raised with both the home secretary and the foreign secretary "the question of India's possible ratification of the Additional Protocols".

Should not the PUCL and the PUDR press the government of India for their ratification? They should also take keener interest in the ICRC's proposals, mentioned above, in respect of Kashmir. The report says:

> The legal bases of any action undertaken by the ICRC may be summed up as follows:
>
> In the four Geneva Conventions of 1949 and Additional Protocol I, the international community gave the ICRC a mandate in the event of international armed conflict. In particular, the ICRC has the right to visit prisoners of war and civilian internees. The Conventions also confer on the ICRC a broad right of initiative.
>
> In situation of armed conflict which are not international in character, the ICRC also has a right of initiative recognised by the states and enshrined in the four Geneva Conventions.
>
> In the event of internal disturbances and tension, and in any other situation which warrants humanitarian action, the ICRC has a right of humanitarian initiative which is recognised in the Statutes of the International Red Cross and Red Crescent Movement and allows it to offer its services to governments without that offer constituting interference in the internal affairs of the State.

Article 3, common to all the four Conventions provides for ICRC's role "in the case of armed conflict not of an international character occurring in the territory" of a signatory to the Convention.

This is the essence of the ICRC's style. It is humanitarian and sensitive. It is not legalistic or intrusive. It seeks to build up an effective international humanitarian law by persuading states to formulate and ratify appropriate binding international conventions. Last year, it convened at Geneva the International Conference for the Protection of War Victims. It is hoped that by 1995 concrete results will be achieved.

The *International Red Cross Handbook* contains all the pertinent documents including full texts of the Geneva Conventions, Additional Protocols, the Hague Conventions of old, the statutes of the International Red Cross and other documents including those pertaining to the international organisation of the Red Cross as a League of Red Cross societies with the ICRC at the apex. A bi-monthly journal of the ICRC, *International Review of the Red Cross*, published from Geneva contains erudite articles on developments in humanitarian law and documents on the organisations' work. The ICRC works closely with the International Institute of Humanitarian Law in San Remo, Italy. Besides, the researches at the Henry Dumant Institute at Geneva make a solid contribution to the development of the law. Indian lawyers and civil libertarians must not fail to make their contributions to these noble endeavours.

SCHEDULES FORMING PART OF THE BALANCE SHEET AS ON 31ST MARCH, 1994

	As on 31.03.1994 Rs. in 000's	As on 31.03.1993 Rs. in 000's
Schedule 1—Capital		
I. Amount of Deposit kept with the Reserve Bank of India under Section 11(2)(b) of the Banking Regulation Act, 1949	107,200	77,200
II. Amount brought into India by way of start-up Capital for a new branch	150,000	150,000
Schedule 2—Reserves and Surplus		
I. Statutory Reserves (Reserves u/s 11(2)(b)(ii) of the Banking Regulation Act, 1949)		
Opening Balance	83,355	51,245
Additions during the year	29,962	32,110
	113,317	83,355
II. Capital Reserves	3,741	3,741
	3,741	3,741
III. Property Investment Reserve		
Opening Balance	75,249	27,199
Additions during the year	7,500	48,050
	82,749	75,249
IV. Balance of Profit	328,455	216,106
	528,262	378,451
Schedule 3—Deposits		
A I. Demand Deposits		
i) From Banks	52,515	2,946
ii) From Others	689,513	507,005
II. Savings Bank Deposits	203,822	136,112
III. Term Deposits		
i) From Banks	352,399	355,912
ii) From Others	5,623,405	2,042,694
	6,921,654	3,044,669
B i) Deposits of branches in India	6,921,654	3,044,669
ii) Deposits of branches outside India	-	-
	6,921,654	3,044,669

	As on 31.03.1994 Rs. in 000's	As on 31.03.1993 Rs. in 000's
Schedule 4—Borrowings		
I. Borrowings in India		
i) Reserve Bank of India	700,000	1,272,600
ii) Other Banks	55,495	281,973
iii) Other institutions and agencies	391,353	-
II. Borrowings outside India	495,851	91,698
	1,642,699	1,646,271
Secured borrowings included in I & II above—Rs. Nil		
Schedule 5—Other Liabilities and Provisions		
I. Bills payable	84,623	109,385
II. Inter-office adjustments (net)	29,291	40,039
III. Interest accrued	92,485	42,399
IV. Others (including provisions)	160,925	132,497
	367,324	324,320
Schedule 6—Cash and Balances with the Reserve Bank of India		
I. Cash in hand (including foreign currency notes)	12,028	11,579
II. Balances with the Reserve Bank of India		
i) In Current Accounts	397,989	557,022
ii) In Other Accounts	-	-
	410,017	568,601
Schedule 7—Balances with Banks and Money at Call and Short Notice		
I. In India		
i) Balances with Banks In Current Accounts	4,121	18,584
ii) Money at Call and Short Notice With Banks	-	93,706
	4,121	112,290
II. Outside India In Current Accounts	41,387	87,105
	45,508	199,395

XIII. Head Office Charges	13,181	16,598
	188,903	155,759

Schedule 17—Notes Forming Part of the Accounts for the Year Ended 31st March, 1994

1. **Principal Accounting Policies**

1.1. General

The accompanying financial statements have been prepared according to the historical cost convention and conform to the generally accepted accounting principles and to the practices prevailing within the banking industry in India

1.2. Foreign Currency Translation

a) Assets and liabilities in foreign currencies as well as outstanding forward exchange contracts are revalued at the appropriate year end rates as speci'ied by FEDAI and the resultant gains or losses have been taken to the Profit and Loss Account

b) The balances held under Foreign Currency Non Resident (A) deposits scheme are stated at the rates specified by the Reserve Bank of India from time to time.

c) Outstanding forward exchange contracts have been disclosed as contingent liabilities at the contracted rates

1.3. Investments

a) The Bank's entire investment portfolio has been treated as "Current Investments" and the same has been valued at the lower of cost and market value in aggregate, categorywise, as per the guidelines issued by the Reserve Bank of India

The market value for this purpose has been ascertained on the basis of "Yield to Maturity" method wherever reliable Stock Exchange quotations are not available.

The cost for this purpose is the cost of acquisition and in case of Zero Coupon Bonds, includes discount accrued over the remaining tenure of the security

Seshan in Kurnool

K Balagopal

Indian electoral democracy has undoubtedly led to a lot of political awakening among the poor and the oppressed, and even a certain amount of empowerment of these classes. But in its principal aspect it has functioned less as a means of ascertaining and enthroning the will of the majority than as a means of sharing out patronage, power and property among the rich and the powerful. From the village sarpanch to the MLA, most of the elected representatives today are leaders of gangs armed to the teeth, and the consequent terror is a decisive factor in deciding elections.

THE Chief Election Commissioner of India evokes a lot of absurd images. An unconstitutional temper dedicated to a constitutional passion, a cantankerous arbitrariness forever insistent about rectitude and propriety in others, met from the other side with solemn arguments about breach of constitutional authority by politicians who recognise no constitutional basis for the authority they exercise, and who have so efficiently shaped the electoral process into an instrument of power and plunder that they find it infuriating that a mere public servant can upset the rules devised and smugly worked out among themselves, for themselves and by themselves: that is surely a setting that can only call forth images of absurdity. What enrages politicians so much about Seshan is that he is so much like them: arbitrary, arrogant, an unruly bully when he can get away with it and a model of humble rectitude when the courts pull him up. And while perforce the two of them debate the matter in terms of a dubious disjunction between legality and popular sovereignty, one may more fruitfully reflect that it is in the nature of human affairs that all right things are attempted by the wrong people; that it takes excesses to make moderation possible; that reason is given a hearing only when it is taken to unreasonable lengths; and that it is prohibited to human beings that right things may be achieved by right persons using right means advocated to just the right extent.

Seshan looks (at least in his photographs) and behaves so much like a bull that one is tempted to call him a bull in a china shop, except that Indian politics is no chinaware, neither in fragility nor innocence (and one is of course not talking of aesthetics). One could describe his effort at electoral reform as tilting at windmills, except that the windmills themselves are so genuinely scared that there is evidently something to his effort that is not merely quixotic. One could see in him a sadhu preaching to a dacoit gang, but this is one sadhu who speaks the dacoits' language. One could call him a fool rushing in where angels know better, but then a lot of angels appear to look forward with genuine hope to what this fool can do.

One could, therefore, do worse than to take Seshan a little more seriously. It requires no great intellectual effort to recognise that while he may trim the excesses of electoral combats a little, he cannot finish the task of making India a full-fledged electoral democracy. But that little is firstly, not worthless by itself, and secondly, in all human effort at reform and change, what is often more important than the material alteration achieved is the value-system generated thereby, for that value-system creates an altered culture that shapes future social behaviour. Human beings live by the values their culture believes in, and the creation of new values, the consolidation of a new value-framework for human social behaviour, which will in turn impel people to take on the systemic obstacles to change, is what every effort at change principally achieves. The change achieved can only be slight in the case of a lone effort by a cantankerous individual whose intentions are not always very straight or very clear, but it is nevertheless worth taking seriously. In particular, it is important to look at the cultural and systemic obstacles that Seshan's effort, taken deservedly or not at face value, will have to face, in the hinterland of Indian democracy.

The people of Kurnool district in the Rayalaseema region of Andhra Pradesh have had election after election forced upon them, while the discerning among them know better than anybody else that their society and culture are least ready for electoral democracy of any kind. First, the parliament member from Nandyal resigned and the people were directed to elect the nation's prime minister to parliament, and with a record lead to boot. And then Vijaya Bhaskar Reddy, the member of parliament from Kurnool and union law minister, was made chief minister of the state, which meant that he too had to be elected to the state assembly. Panyam was vacated for him and the people were directed to elect the chief minister ("otherwise there will be no development for Kurnool"). They did their best and did elect him, but the 'big man' was not happy with the votes he did not get. He said in public meeting after public meeting after getting elected, that he knew who had campaigned against him and would 'take care of them, whether they are high or low'. And then, of course, the parliament seat of Kurnool vacated by him had to be filled, and who should be the Congress candidate but his son? It was his seat that he had vacated, the better to serve the people, and who should the inheritance go to but his dear son, whether according to the Hindu or any other property law? And so the people of Kurnool were directed to elect the son to parliament on May 26 this year, and they have dutifully done so, except that he scraped through with a rather small lead. So base is the people's ingratitude, even to men that have served them for decades and are bent on serving them for ever, from father to son, from father to son, from father to son...

ELECTIONS IN KURNOOL

But that is not our story. Our story is what exactly does the electoral process mean in a district like Kurnool; and what must happen before electoral democracy becomes a thing of substance there; and how little of it comes within the purview of the Election Commission, whether that consists of one, two or three members; whether there is a chief among them who is more equal than the others; and whether that chief will be Seshan in perpetuity. This is of course not at all to say that what the EC can do is altogether immaterial, nor that the recent debate about its reconstitution is a vacuous debate. The people of Kurnool themselves did not think so during the by-election this May. The least literate of them had heard of this miracle man called Seshan who had put the fear of the law in the hearts of the lawless lords of their lives, and they were so curious to know what the creature looks like that when Seshan stopped off at a small town in Kurnool constituency on the way to Mantralayam (he seems to visit gods as frequently as politicians do), villagers flocked around as if he were a film star.

Jagadurti is a village off the Hyderabad-Bangalore national highway. It is ruled by former sarpanch Lakshmi Reddy, an elderly man, an uncle of sorts of chief minister Vijaya Bhaskar Reddy. This old man evidently belongs to an era that pre-dates even notional democracy, for he takes pride in the fact that there is little of it in his village. No sir, nobody campaigns for any party other than the party he supports—which happens to be the Congress but could well

be the Telugu Desam Party some day—in his village. It has never happened, and it would be improper if it ever did happen. He himself sits as the poll agent inside the booth, and people show him the stamped ballot paper before consigning it to the box. It has always been so. It is a tradition of the village, and it would be improper if anybody violated it today. Will the opposition party find a poll agent in the village? Well, nobody from the village would actually sit as an opposition agent in the village, for that would also be improper and contrary to the traditions of the village. But since it is said that according to some statutory vanity all candidates have a right to have their agents in every booth, even if they are so poorly off that nobody from the village will sit on their behalf, well then, they can get an agent from outside and he would be treated as an honoured guest, according to the village traditions. But such an agent should in turn respect the village traditions and not behave impolitely. That would be improper. Finally, he has heard of some stupid electoral rule or fancy that all the votes of a village cannot be cast for a single candidate, even if the village has no tradition of differing in such matters, and that if there is hundred per cent unanimity there will be a repoll, which he thinks is utterly stupid and undemocratic, but as such is the law, he himself sees to it that the opposition candidate gets the last 10 per cent of the votes. The people will be directed to vote for the worthless fellow.

This is not an isolated village. There are plenty of villages in the district where landlords who are close relatives or followers of the chief minister rule life with such completeness. What happens to those who resist their authority? They can be killed. They can be banished from the village and their property destroyed or seized. It should not be thought this violence is committed by some paid agents or hirelings of the landlord. The landlord's loyal following would normally consist of quite ordinary villagers who would lynch the disobedient with a genuine sense of outrage. There is for instance this complaint made by the Telugu Desam Party to the Chief Election Commissioner about the SI of police, Kodumur, who they alleged had forced a TDP supporter to remove the party flag and banner from his house. The SI's explanation is that the man's village is close to the chief minister's native village Laddagiri, right on the road in fact, from Laddagiri to the mandal headquarters, and so if this man continued to sport TDP insignia he would cause needless provocation to the men of Laddagiri passing by, and as the loyalty of that village to Vijaya Bhaskar Reddy's family is well known, that would have fatal consequences. That is why, the SI insists, he had advised the TDP supporter, in his own interest and as part of the policeman's official duty to prevent cognisable offences, to remove the party banner and flag and "silently vote for the TDP in the anonymity of the polling booth if he wanted to", an act of thoughtful charity and dutiful policing that the TDP leaders misunderstood. Whatever the honesty of the policeman's explanation, the fact that he chose this as a credible explanation reveals a lot about society in rural Kurnool.

There is another Lakshmi Reddy, an even closer uncle of the chief minister, who rules over the village of Lakkasagaram. This is an airtight monarchy into which not a single whiff of liberty has ever entered. Even N T Rama Rao on his electoral visits to the area would pass by this village and hold meetings elsewhere. A stranger who enters the village cannot and will not be allowed to talk to the residents directly. The residents themselves would be either too scared to talk or would regard such liberty quite sincerely as an outrage. Any talking that is to be done will be done by Lakshmi Reddy, and that is that. It would be difficult to convince many (though mercifully not all) people of the village that there is anything wrong in this.

It can be argued (and landlords frequently do argue) that quite apart from the last 10 per cent or so of the votes that those who rule the village will themselves direct to be cast for the opposition in case of uncomfortable unanimity in the village, there is nothing at all to prevent at least the courageous of the dissenters from voting for the opposition in the anonymity of the polling booth (and if you do not have the courage, why ever should you dissent?). The possibility certainly does exist, and seems to have been utilised is sizeable measure this May, going by the final result. And the possibility has certainly been enhanced by Seshan. The earlier practice was either that the voter shows the stamped ballot paper to the landlord's agent sitting inside the booth before putting it in the box; or that the polling agent would himself stamp each ballot paper and hand it over the voter to personally put in the box, as a token of democracy; or worse still that four or five of the landlord's men would themselves stamp all the ballot papers (including some in favour of the opposition) without troubling voters to come all the way to the booth, and put them all in the box, in the presence of the gaping poll officials. And there would be no opposition agent sitting in the booth to protest; or if there is one and that one did protest, or if the representatives of the opposition candidate came there and protested, there would be bomb-throwing and violence and possibly a murder or two. Seshan's insistence on deploying large contingents of paramilitary at the booths, and on strictly preventing big groups of persons from moving around on poll day has encouraged the TDP to send its agents from outside the district to each booth to protest at every malpractice. They could not prevent all impersonation, for the agents from outside could not possibly know who is who in each village, and where they did try, in Vijaya Bhaskar Reddy's native village Laddagiri, they were physically driven out of the village. Yet the presence of the police and the opposition poll agents did cut down the rigging in most villages. The decision of the Election Commission not to count votes booth-wise, which would reveal which locality voted sizeably for whom, also gave courage to the voters to exercise their choice more freely than ever.

Limited Change

All this has helped, and many have publicly acknowledged the victory of Seshan in making the recent by-election to the Kurnool parliament seat more democratic than any election before it in the district. And yet elections are not won by voters deciding in the secret of their hearts whom to vote for and exercising that choice in the secret of the polling booth. The liberty to campaign and create a climate of opinion in favour of the opposition candidate is an essential aspect of electoral democracy, and this is where the rules and procedures of the Election Commission are of little help against the entrenched social terror exercised by the armed landlords. It is impossible to provide heavy police escort for every campaign meeting of every candidate in every village. And even if that were possible, that would only apply to the campaign meetings held by outsiders coming to the village, meetings of the kind that are by their nature possible at most once in each village of a constituency even in the most intense campaign. One cannot think of any security at all for villagers living in the village and campaigning by word of mouth in the village. Even if they go unmolested prior to the poll out of fear of the action that the very arbitrary and unpredictable Seshan may take, after the poll is over, the result is declared, Seshan's men are back in Delhi, and Seshan's jurisdiction over the happenings in Kurnool is terminated, there can and will be retaliatory murders and arson targeted at those in the village who openly sided with the opposition candidate. Tell anti-Congress voters in Kurnool to exercise not merely their vote but the whole gamut of their political liberty freely, and they will ask you in return: "Will you be with us in the village after the poll is over? You won't? Then don't advise us".

Apart from the liberty to differ from the 'big men' of the village and openly express the difference, what is even more basically required is a culture in which such liberty is recognised and prized. Whereas what prevails in Rayalaseema is a culture in which the human traits of loyalty and faith are tied to the feudal-patriarchal mode of society, so that the liberty we are speaking of may well be seen as an illegitimate disloyalty to the natural leaders and elders of society, and would be recognised as legitimate only if there is an opposition faction within the

dominant class to whom the loyalty can be transferred. Existing conjointly as this trait does with a proneness to violent expression of anger, which is again sharper in Rayalaseema than elsewhere, it can mean that the desire for individual liberty may attract violent hostility from one's own fellow creatures, persons of one's own class, caste and family. Even in factional conflicts among followers of different Reddy landlords, the violent anger and hatred that can and does divide close kith and kin is startling to an observer unfamiliar with the specific mode of feudal culture dominant in Rayalaseema.

If we leave aside the generality of the feudal-patriarchal culture, not every village of Kurnool or any of the Rayalaseema districts answers completely to the above description. There are plenty of villages where some degree of freedom from social terror does exist. But there are equally plenty of villages which landlords such as the two Lakshmi Reddys described above rule totally with their gangs armed invariably with country-made bombs, and often also guns. Over the last decade and half, Rayalaseema warlordism has constituted itself into a structure that has MLAs and ministers at the top, civil and excise contractors, smugglers and less disreputable businessmen at the middle, and village landlords at the base. It determines and dominates all spheres of political as well as civil society. Chief minister Vijaya Bhaskar Reddy has for long been a seemingly gentlemanly operator situated in the upper echelons of this warlord structure, though after becoming chief minister he has shown that he possesses quite ungentlemanly fangs in addition to a gentlemanly demeanour.

The guns at one time used to be mostly illegal weapons acquired or made at home. The bombs, of course, are made locally, and (Manmohan Singh, please take note) if the manufacture is legalised and its extent properly estimated it would make a sizeable addition to the GDP of Rayalaseema without any further investment. The people themselves joke that bombs are as cheaply available as putrefied vegetables. But in the last five years or so guns have also multiplied in number and gun licences are easier to obtain now as quite a few of the warlords have risen to important positions in the state government. Vijaya Bhaskar Reddy, Mysoora Reddy and Diwakar Reddy (from Kurnool, Cuddapah and Anantapur districts, in that order) have been and are in powerful positions.. And the principal Congress dissident, Y S Rajasekhar Reddy from Cuddapah is an archetypal warlord. Gun licences are therefore much easier to obtain, with their own men at the top. You commit a murder and apply for a gun licence as you fear retaliation, for the police have 'falsely implicated you in the case'; the kith and kin of the deceased apply for a gun licence exhibiting the corpse of the man you have slain as proof of a bona fide threat to life. As both of you have your own men as MLAs and ministers at Hyderabad, both get gun licences in due course. The granting of such licences is supposed to be preceded by a local police enquiry concerning the applicant's criminal proclivities, but such inconveniences are easily avoided. As policemen bemoan these days, "these fellows do not even give their home addresses in the application. They give a Hyderabad address and get hold of some MLA or minister who ensures that the local police dutifully certify that the man has no criminal record locally and get the licence, and it is only when we see the fellow going around with a gun back home that we realise he has gone and got a gun licence".

The point is that this weaponry increases the terror they exercise. The terror is a means of property acquisition; it is a means of political power and patronage. All manner of petty local bullies gather around these armed lords, and constitute a formidable obstacle to any democratic assertion, whether electoral or otherwise.

These armed gangs are anachronistically described as 'rural factions' in police and administrative parlance, though they have evidently outgrown their origins in village factionalism. It is a paradox that they are today seen (though not always vocally condemned) as an obstacle to democracy and development, for it is precisely the kind of political democracy and the kind of economic development that India has had that is at the root of the evolution of warlord gangs from their pre-independence roots in what may be properly called village factionalism. Village factions born of conflict between Reddy landlords (but also a few non-Reddy landlords and elders of close-knit castes as the Boyas, too) over property and power (and some times women) have a long history in the Rayalaseema districts. Every slight, imagined or real, had to be avenged as viciously as every substantial challenge to one's power, property or prestige. Assault, murder and burning of houses and cornstacks was the principal means of the assertion of one's strength and 'manhood'. And, of course, each such attack had to be avenged with equal 'manliness' from the other side. This meant the creation of hereditary enmity that went on from generation to generation, often until one family was either exterminated or driven out of the village. It also meant the creation of loyal gangs from out of poorer castemen and lower castes by each warring side, and as the gangs indulged in mutual violence, subsidiary enmity between fresh families lower down the social scale would be created. These gangs (even today) are different from urban mafias in two respects: one is that they are made up not of professional criminals but peasants (though they do involve themselves in illicit activity such as smuggling forest produce, growing opium or making liquor illegally), and the second is that what binds the gang to the master is not only pecuniary or other material benefit (though there is often plenty of it) but also an intense feudal loyalty, the loyalty owed as a matter of traditional 'dharma', to the 'elders' of the village, which means either upper caste landlords or the hereditary elders of each caste, especially the tight-knit castes such as the very militant and clannish Boyas. Over this factionalism was super-imposed another trait that Rayalaseema inherited from the anarchy that followed the demise of the 'war state' of the Rayas of Vijayanagar: the rule of armed chieftains (sometimes called 'polegars') over groups of villages, a few or hundreds in extent, a rule that amounted to little more than plain plunder by the chieftain and his violent gang of castemen and followers.

The British did their bit to subdue this two-tiered feudal structure of violence, or at least to come to terms with it. They failed, no doubt because for them it represented merely a problem of public order and crime. But political democracy and economic development of the post-independence period has peculiarly enhanced, politicised and modernised the phenomenon. Indian electoral democracy has undoubtedly led to a lot of political awakening among the poor and the oppressed, and even a certain amount of empowerment of these classes. But in its principal aspect it has functioned less as a means of ascertaining and enthroning the will of the majority than as a means of sharing out patronage, power and property among the rich and the powerful. It has functioned too as a means of recanalising the forms of traditional power and property into modern channels. And therefore, the violence of the armed landlord factions has fitted neatly into electoral combat, while the sanctity and the position of an 'elected representative' has lent ideological legitimacy as well as some amount of 'state power' to the erstwhile armed lord. From the village sarpanch to the MLA, most of the elected representatives today are leaders of gangs armed to the teeth, and the consequent terror is a decisive factor in deciding elections.

Quarry-Based Economy

As for economic development in Rayalaseema, the semi-arid region has little potential for growth based on agricultural prosperity. It is on the other hand rich in minerals and commercially valuable slab stone, and hence quarrying and processing is a major economic activity. This rough work suits the rough culture of the region, and it was soon enough discovered that whoever controls the gun and the bomb also controls the quarry-based industry and trade. The guns and the gangs that had first come into being in village factional fights turned their attention—just as they turned their attention to electoral

politics--to the quarrying and polishing of stone. The units are allowed to be owned and operated by harmless entrepreneurs (it is too much of a bother looking after the economics of running the enterprises) and the armed warlord gangs step in as 'protectors' and collect tolls on every piece of material quarried or shifted out.

And then there are the civil and excise contracts offered by the public sector economy, such as contracts for the laying of roads, the digging of canals and the vending of liquor in retail. Indeed, everything monopolised by the state, whether it is forests, public works or liquor, creates contractors in its execution, transport and retail vending, and if you can drive out all competitors at the auction you can take the contract for a high profit margin, and then either execute it, or (if that is too much of a bother) subcontract it out to somebody else. Once again, therefore, the bomb and the gun helped to create a monopoly in public works and other contracts. Territory is parcelled out among the warlords into zones where none competes against another, and if any outsider enters the fray he is either politely bought out or abruptly bombed out.

Thus the economy and politics of post-independence India helped develop the feuding village factions into big mafias that use armed terror as a decisive means of dominating politics and the economy. And also, gradually, the whole of social life. All social problems and conflicts end up at the palatial houses of the warlords, to be decided with the threat or infliction of violence, and according to the very primitive notions of equity, morality and fairness that the warlords possess. Disputes of property, contract, marriage, divorce and every conceivable familial and inter-personal problem finds an abrupt and final resolution there. The problems are robbed of their delicacy, sensitivity, robbed of their social, political and ethical dimensions and reduced either to the customary feudal-patriarchal notions of rectitude or—one does not know whether this is worse or better—mere calculation of factional political advantage.

It is in such a society that we are speaking of the Election Commission's dicta. Till now, in faction-ridden villages of Rayalaseema, the people have had some freedom only when two gangsters are at loggerheads, thereby giving the people a chance to 'play one devil against the other' as the people themselves say. But looking at it this way involves romanticising the people as helpless victims of armed gangs, whereas a lot of them are, simultaneously and knowingly, loyal partisans in the warfare. They are not an innocent entity waiting to be liberated from the mafias but are in sizeable measure faithful and conscious participants in the violence and the terror that robs their society of democracy and justice. One may then (following a strong current philosophical fashion) question this notion of democracy and justice as alien, occidental or elitist, but the test is not an eclectic relativism that decrees to each what they believe they want, but whether a given social structure and culture, and the way they mould human traits in society, are conducive to the promotion of a life which assures the full development of each person (concurrently with the full development of all). If this criterion too is described as a western value, one can either point out that there is a grain of it in the Buddha, or else say so much the worse for the east-west dichotomy.

Without the notion of a democracy and justice that transcends the feudal-patriarchal culture of Rayalaseema, the only freedom available to people within the culture, a freedom that they exercise with great violence, is the freedom to change masters and suffer more violence in the process. The May 26 by-election in Kurnool saw explicit group violence and police firing at the village of Eerladinne. This village is close to Kothakota, the native village of Prakash Reddy, nephew of the chief minister. Only a few years ago, this bearded young man was regarded as Vijaya Bhaskar Reddy's political heir. Government officials in Kurnool did his bidding though he was not even an MLA. And it was this man that master-minded the shameless drama of abduction and wrongful confinement of prospective candidates at the time of P V Narasimha Rao's Nandyal election. He was also at the forefront of the massive rigging that heralded the prime minister's entry to parliament. It was predicted that this Prakash Reddy would rise to heights in the state's politics.

But he was only a nephew and not the son That was his tragedy. For the chief minister does have a son, Suryaprakash Reddy by name, apparently a good-for-nothing in political warfare, but a son nevertheless. Gradually the son rose and the nephew set, and when the son was openly promoted as the Congress candidate for the Kurnool by-poll, the nephew defected to the eager Telugu Desam Party, which habitually waits at the back door to lap up disenchanted Congress gangsters as they come out, and spends time in the interval lecturing the people about the evils of the culture of the gun promoted by the Congress in Rayalaseema. Having joined the TDP, Prakash Reddy vowed to defeat the chief minister's son.

Eerladinne is one of the half a dozen villages in the neighbourhood of Prakash Reddy's native Kothakota, that were entirely under that man's thumb. They had lived in feudal peace, voting and living as Prakash Reddy desired. The obedience, as we have said above, is due partly to the traditional and willing loyalty that a powerful Reddy commands, and partly to the terror induced by the proximity of his guns. When such leaders switch parties, the people too normally switch their electoral loyalties. Thus soon there was the strange sight of all the walls in Kothakota being adorned with yellow-coloured posters of a smiling N T Rama Rao, whereas that man would not have been able to do so much as hold an election rally in the village in the past.

But Eerladinne alone of the domain of Prakash Reddy did not switch over completely. A couple of local Reddys decided to stay with the chief minister, and so the village split into two, one section passionately loyal to Prakash Reddy in his new apparel and the other full of a new-found passion against him. As it happened, the election booth was located near the houses of those loyal to Prakash Reddy. On poll day, when the renegades went to vote the loyalists deliberately picked up a quarrel with them and chased them away with a rain of stones and sticks. But the renegades were not deterred. They regrouped by afternoon and went in a bunch in a couple of tractors and voted for the Congress, defying the loyalists' wrath. This defiance is undoubtedly a democratic assertion, but in the interest of another Reddy. And moreover soon they may have to pay heavily for it if the Telugu Desam Party comes to power, a not unlikely eventuality in the coming elections, in which case Prakash Reddy is bound to become a powerful man.

Not all of India is Kurnool, but there is a little bit of Kurnool in the most civilised part of the country. And there are, of course, whole regions of the country, including certain metropolitan slums, that are no different from Kurnool. Whatever form and meaning we give to electoral democracy as an instrument of representative government, the social structure and culture of a sizeable part of India is a hindrance to it. Much change needs to take place at the level of social structure and culture before it can become genuinely representative, once again whatever formal alterations may be made. While this has been so for a long time, the fast deterioration of the political establishment that we see today has its concomitant in an increasing resort to suppressive violence by the rich and the powerful, a violence against which the unorganised weak have no defence unless they happen to be part of a rival gang.

This situation is enough to defeat any bureaucratic attempt to make democratic political choice in elections a reality. To say this is not to advocate defeatism but to point out that the task of evolving a genuine representative democracy in India is much bigger than would be deduced from the debate centred on P V Narasimha Rao's childish attempts to cut Seshan to size. It is a much more difficult, cultural and political task than voting against the constitutional amendment dreamt up by a prime minister whose imagination cannot rise above that of a village patwari.

Cracks in the Alliance

Amaresh Mishra

The BSP has made no pretence of pursuing radical politics. A mainstream following which it has sought to mobilise by seeking the support of the Muslims is now in jeopardy.

WITH the open revolt of a BSP minister in Uttar Pradesh against the central leadership of his party, the wheel has turned a full circle. While Kanshi Ram appears to have temporarily warded off what proved to be a critical moment in his half year long rise to political prominence indications are that problems within the BSP run deeper and politics in the state may be entering a period of permanent instability.

The current drama began when Masud, the state education minister and a high ranking BSP leader who was the party's prime representative in the 'minority quota' of the SP-BSP government, resigned in June alleging a pronounced 'anti-Muslim' bias in the party leadership. Masud's tirade was specifically directed at the BSP's national leader and ex-MP Mayavati whom he accused of making wild statements which amounted to questioning the loyalty of Muslims. He also went on to allege widespread factionalism in the ranks of the BSP largely due to the efforts of Mayavati to run the party as her personal property with the tacit support of Kanshi Ram. The name of the BSP supremo was thus also directly dragged into the controversy and the attacks on Mayavati ultimately became a tirade for a change in the party's leadership.

Ironically, this development took place after the successful conclusion of the mid-summer by-elections in the state which saw the SP-BSP combine winning comfortably, four out of the six assembly seats against its main rival the BJP. Despite capturing two seats the latter returned from the polls with its vote percentage down by more than 2 per cent and the loss of the Bhagwantnagar seat from Unnao district, formerly held by the party. The defeat in Unnao as also the lowering of the victory margin in Kasganj, Etah which was one of the two seats that had returned the former chief minister Kalyan Singh with a comfortable majority in the last elections, showed what is increasingly becoming evident after the political consolidation of Mulayam Singh, viz, the drawing away from the BJP of a significant chunk of the backward caste vote which had stuck by it during the assembly elections. The party's victory in the Meerut parliamentary polls and the Hastinapur assembly segment from the same district also in no way detracted from this fundamental point: these fell into a familiar pattern prevailing in west UP where the upper castes and the jats are still by and large with the BJP while the SP is weak. The BSP on the other hand has been unable to recoup its position in the area and incidents like the Meerut firing have further contributed seemingly, to the party's continued downslide.

More than the BSP, the elections in fact were seen as a triumph for Mulayam Singh: during its course the chief minister made it a point to personally visit the areas from where the BSP candidates were fighting. The BJP's weakened position amongst the backwards was also attributed to the personal involvement of Mulayam to woo these sections in different parties. The BSP's position was also weakened by the fact that the party did not appear overly keen to ensure the win of a few of its candidates, a point which was raised by Masud when he accused Mayavati of deliberately trying to orchestrate the defeat of the party's candidate from Ghazipur.

The ruckus within the BSP, however, possessed both an internal and external dimension; for one it had more than a casual link with Mulayam Singh's strategy to weaken the party from within so that if it decides to withdraw support from the government at any future date, the chief minister can wean away a substantial number of legislators. Here the chief minister's apparent effort has been to isolate the BSP by slowly weaning away the support of the backwards and the Muslims so that ultimately the BSP is left with only its dalit base.

Such a scenario will virtually amount to ousting the BSP from the mainstream political arena and reverse the party's trend; for the BSP, which in any case is not into any form of radical politics, the extension and consolidation of its constituency beyond the dalits, especially amongst the backwards and Muslims is vital if it has to remain in the mainstream. It was perhaps with this in mind that Kanshi Ram had taken several steps to specifically woo the Muslims: he had directed the teaching of Urdu in the BSP's state office in Lucknow, and issued statements which labelled Mahmud Ghazni as the liberator of dalits in Kanpur. The BSP chief was visualising a probable dalit-Muslim combination for the future which would have proved detrimental to Mulayam Singh.

Anticipating this, the chief minister too had adopted the Urdu plank: in recent months he has announced state policy in favour of vigorously pursuing the promotion of the language, both as a compulsory part of the three-language formula at the expense of Sanskrit and further incentives like large-scale recruitment of Urdu teachers. Most of these measures like the grant of the second language status to Urdu were actually introduced by the Congress ministries of the 1980s and it is still not certain how far they will go beyond the cosmetic sops handed out due to political compulsions to the most cultivated of all languages in the Indian subcontinent, a language which is fast facing extinction in the very home of its spread and refinement.

The contention for Muslim support apparently was a major factor in Masud's tirade against the BSP. Most of his statements steered cleared of blaming Mulayam in any way and even went on to endorse the pro-minority role of the present government. Leaders of the Samajwadi Party also issued statements in favour of the rebel leader and Kanshi Ram was clearly put on the defensive, both on the Muslim question and the issue of the Mayavati. The BSP chief and his lieutenants retaliated by issuing statements both against the rebels and the Mulayam government. Much of the counter-attack was directly aimed at the chief minister and it appeared that the BSP would withdraw on the day of the 'anti-defection' rally which Kanshi Ram had called for on July 10. The very labelling of the event as an anti-defection on exercise carried anti-Mulayam overtones as the chief minister has engineered the biggest defections of all times in the state; more particularly, it was meant to demonstrate the strength of the BSP leadership as a deterrent against the dissidents and their 'backers'. The political temperature of the state had risen, and on the eve rally newspapers and analysts began predicting the fall of the government.

As it turned out, the outcome proved to be anti-climatic. Kanshi Ram refrained from going all out against the chief minister preferring to point out only some obvious anomalies like his weak resistance to brahmanical forces. By stating that since the same forces are also arraigned against the chief minister, the BSP leader baled out the government and offered his continued support. He then went on to lambast the rebels finally coming down on Masud in what amounted to a tirade against a single personality, uncharacteristic for a leader of national standing. This style of functioning, however, was apparent even in the approach towards Mulayam Singh where criticisms were more in the form of personal complaints.

Kanshi Ram's apparent climbdown, however, was only natural. All indications were that if support was withdrawn, the BSP would split and a number of MLAs would cross over to the SP. Internally the BSP was actually jolted by the trouble in its ranks and it is doubtful whether it could have sustained a split. For, in recent months the party has clearly moved away from even its characteristic 'grass roots rhetorics' and mobilisation, whose raised pitch had led to several clashes in the UP countryside. Now, as is apparent from the various moves of Kanshi Ram, the party is trying to build its own constituency through top-level politicking. Its failure, however, to cultivate a second constituency beyond the dalits left the BSP devoid of a mainstream position of supremacy. But since its existence now depends on maintaining this slot, withdrawal from the Mulayam government at this juncture could have proved suicidal.

After all, despite all efforts, the BSP is finding it hard to win acceptance in the mainstream arena. Apart from the political factors, it has yet to cultivate a chunk from amongst the bureaucracy and appears to be losing support from amongst the dalit bureaucrats as well. In the July 10 speech, Kanshi Ram attacked dalit bureaucrats in particular for failing to work in the interest of the Bahujan Samaj, and earlier, despite stringent opposition from the BSP, a police official was given a lucrative post by the Mulayam government and another retained his office even after he was transferred. The row with dalit bureaucrats possesses another interesting dimension; while the BSP is trying to forge a social unity of the Bahujan ranks the latter are showing a tendency to split along the lines of socio-economic status. This has happened with the privileged in the countryside only recently. Now the officialdom too is not prepared to sink its natural differences for the sake of artificial unity.

Yet even though Kanshi Ram has won a reprieve for his party, his position has actually weakened. He has had to offer concessions to Mulayam like restraining Mayavati and very significantly, his support to the Mulayam regime did not include the extracting of any conditions like protection to the dalits and effective governance. In the past the BSP chief used to demarcate his position by raising certain issues ag nst the government. But this time the attacks were mainly personal and incidental, the issues missing entirely from the agenda. There was also a hint of frustration with the Muslims and Kanshi Ram mentioned the fact that after the Masud episode he has lost confidence in the Muslim intelligentsia as well as the 'Mullas'. This was, indeed, a far-reaching statement supported as it was by appeals which spoke of going slow on dalit-Muslim solidarity. In all this, it is possible that Kanshi Ram is buying time and waiting for the re-emergence of a favourable situation. But it is equally possible that for the BSP the slide down from politics from above has begun just as the Meerut firing incident two months ago had signalled the end of euphoria for sentiments from 'below'. It is possible that especially given the political vacuum in the state the BSP may be able to retain its dalit base but from now on it is highly unlikely that despite its shrill tone, the party will carry the same edge at the political level. This is seen from the fact that not many concessions were wrenched from the Mulayam government—at most the chief minister yielded to demands of evicting Masud from his government bungalow and is reportedly considering a reshuffle of his ministry. But the contention between the two key figures has moved on to a different plane and in the days to come, political uncertainty with the prospect of sudden and dramatic happenings will continue to dog the state. The situation will also further exacerbate the existing political vacuum, which in spite of the presence of a number of mainstream forces and so much activity, only becomes more and more obvious with the passage of time.

Proposed Forest Act: An Assessment

Sharad Kulkarni

The proposed Conservation of Forests and Natural Eco-Systems Act is an improvement on the existing forest legislation. However, certain provisions of the bill go against the interests of the people, particularly adivasis and other forest dwelling communities.

IN 1980, the central government had circulated a draft of the proposed Indian Forest Act that was harshly criticised for its anti-adivasi and anti-people approach.[1] The government took notice of this opposition to the bill and it was not introduced in the parliament. Later, in 1985 the department of forest was transferred from the ministry of agriculture to the newly constituted ministry of environment and forests. It was the ministry of environment and forests that drafted the National Forest Policy Resolution approved by the parliament in December 1988.[2]

National Forest Policy Resolution, 1988

It was categorically stated in the resolution that the principal aim of the forest policy must be to ensure environmental stability and maintenance of ecological balance including atmospheric equilibrium which are vital for the sustenance of all life forms, human, animal and plant. The derivation of direct economic benefit must be subordinated to this principal aim.

The policy statement asserted that the existing forests and forest lands should be fully protected and their productivity improved, so as to continue to provide sustenance to tribal population. The national goal should be to have a minimum of one-third of the total area in the country under forest or tree cover. A massive need-based and time-bound programme of afforestation and tree planting should be undertaken. It was stated that the life of tribals and other poor people living within and near forests revolves around forests and the rights and concessions enjoyed by them should be fully protected.

The resolution had a special article on tribal people and forests. It was stated that having regard to the symbiotic relationship between the tribal people and forests, all agencies responsible for forest management should see that the tribal people are closely associated in the protection, regeneration and development of forests so as to provide them gainful employment. Efforts should be made to contain shifting cultivation. The practice of providing forest produce at subsidised prices to industries should be discouraged.

Thus the new forest policy resolution made a departure from the commercially oriented, bureaucratic forest management practices.

Forest (Conservation) Acts, 1980 and 1988

After the inclusion of forests in the Concurrent List through the 42nd Amendment to the Constitution in 1976, the government issued the Forest (Conservation) Ordinance on October 25, 1980 prohibiting the state governments from allowing the use of forest lands for any purpose without the approval of the central government. The ordinance was later passed into an Act (No 69 of 1980).

But somehow, the government was not satisfied with the powers conferred on it under the Act of 1980 and tried to increase these with the Forest (Conservation) Amendment Act of 1988. The amendment forbade the state governments to assign by way of lease or otherwise any forest land or any portion thereof, to any private person or to any authority, corporation or agency of any other organisation not owned, managed or controlled by government, without previous sanction of the central government.

Conservation of Forests and Natural Eco-Systems Bill

After the adoption of the national forest policy resolution, it became necessary to remove the wide disparity between the approach of the resolution and that of the prevailing legislation.[3] The law in force was and is still the Indian Forest Act of 1927 as amended by different state governments from time to time. The act was meant to consolidate the law relating to forests, the transit of forest-produce, and the duty leviable on timber and other forest produce, thus to tighten the control of the government over forests. The national forest policy resolution of 1988 had accepted environmental stability and maintenance of ecological balance as the principal aim of forest policy. The government has now come up with a draft forest bill to remove the contradictions between policy and legislation.

Preamble: The preamble to the proposed Conservation of Forests and Natural Eco-Systems Act states that it would "provide for the restoration, conservation and management of forests and natural eco-systems and matters connected therewith and incidental thereto". It is further added that "it is imperative and expedient to conserve forests and natural eco-systems to ensure environmental well-being and stability, preserve natural heritage, augment and safeguard bio-diversity and fulfil the basic needs of the people on the principles of sound ecological management and optimum bio-mass production on a long-term basis, as well as to revive and restore degraded forests and natural eco-systems".

Usufruct Rights: The bill is divided into 14 chapters. Chapter one gives definitions of the terms used in it. Since 1990, the government has been encouraging joint management of forests, giving usufruct rights to those who protect forests. It has, therefore, become necessary to define the term 'usufructs'. It has been defined as under: "Usufructs means forest produce that may be obtained from dead plants, or the produce of or harvest from living plants including grasses, sedges, forbes, herbs, creepers, vines, shrubs and trees, without their uprooting, felling, coppicing, pollarding or destroying, or otherwise debarking or damaging in such a manner so as to hamper or impair [their] natural growth or to threaten [their] survival' (Section 1(29)).

Reserved Forests. The second chapter lays down provisions relating to reserved forests. As in the Act of 1927, the state governments have been empowered to constitute reserved forests on any land which is the property of those governments or over which they have proprietary rights. In doing so, they have to follow the procedure laid down in the Act.

As mentioned earlier, forest is an item in the Concurrent List. But the central government wants to have an upper hand in the management of forests. With this intention, a provision not found in the 1927 Act has now been added. It provides that "where the central government... deems it essential and expedient to constitute a reserved forest, and where the state government has not constituted such a forest, the central government may give directions to the state government to constitute a reserve forest within a prescribed time and to follow the procedure laid down... in this regard (Section 3(2)).

Shifting Cultivation. In the Act of 1927 the state governments were empowered to permit or prohibit the practice of shifting cultivation in reserved forests. However, it was specifically mentioned that the practice of shifting cultivation shall in all cases be deemed a privilege subject to control, restrictions and abolition by the state government (Section 10(5)). In the proposed Act, it is laid down that the state governments can permit the practice of shifting cultivation for a period not exceeding three years, by which time the practice of shifting cultivation is to be extinguished and the alternatives to be provided for rehabilitating the families

that may have been practising shifting cultivation are to be laid down (Section 10(3)).

Claims over Forest Land and Produce: The proposed Act contains a provision that may adversely affect the rights of forest dwelling communities over forest produce. It is laid down that "in the case of a claim to pasturage or to forest produce, a right of way or a water course, the forest settlement officer shall pass an order admitting or rejecting the same, in whole or in part, after considering the viewpoint of the presenting officer, or of the divisional forest officer" (Section 12). In the Act of 1927, only a claim to right of pasture or to forest produce was mentioned (Section 12). The inclusion of a right of way or a water course is bound to create disputes and clashes. This can be avoided if this provision is deleted.

There is another provision in the proposed Act that is likely to lead to conflicts between the people and the forest department. It is provided that "The forest settlement officer shall not, except with the prior approval of the state government, admit claims to pasturage or to forest produce in the proposed reserved forest, (1) if the claimant is a person of a village or town which does not have contiguous boundary with such forest, or (2) the claimant is a beneficiary of any village forest or part thereof so constituted under chapter IV of this Act" (Section 15(3)). The provision that the claimant should be a person residing in a village or town with a contiguous boundary with the forest is reasonable. However, the provision that the claimant should not be a beneficiary of any village forest does not make sense. During certain seasons, a majority of the approximately four million persons collect some forest produce from the village forest. These persons should not be deprived of this right over non-wood forest produce in the reserved forests.

Encroachments: Special provisions have been made to prevent encroachments on lands in the reserved forests. The forest officers are empowered to confiscate the crops on the encroached lands.

De-reservation: The power to de-reserve reserved forest or part thereof was given to the state governments in the Indian Forest Act of 1927 (Section 27). However, the Forest (Conservation) Act of 1980 withdrew this power and laid down that "notwithstanding anything contained in any other law for the time being in force in a state, no state government or any other authority shall make, except with prior approval of the central government, any order directing that any reserved forest (within the meaning of the expression 'reserved forest' in any law for the time being in force in that state) or any portion thereof shall cease to be reserved". This restriction is made more strict in the proposed Act. It is laid down that "the state government may, by notification in the official gazette, direct that from a date fixed by such notification any land or any portion thereof reserved under this Act shall cease to be a reserved forest; provided that no such notification shall be issued unless a clearance has been obtained from the central government or any officer so empowered by the central government in this behalf; provided further that no such clearance shall be granted by or on behalf of the central government for regularisation of unauthorised occupation of any reserved forest or portion thereof, if such occupation is of a period after coming into force of this Act, without resolution to that effect being passed by both the houses of parliament" (Section 27(1)).

The supremacy of the central government over state governments has been made quite explicit by a special provision in the Act relating to reserved forests. It has already been mentioned that the central government is empowered to give directions to the state governments to constitute reserved forests within a prescribed time over certain forest land or any land which is the property of the state governments (Section 3(2)). It has further been provided in the proposed Act that if the direction to the state government under the said section has not been implemented by the state government, the central government may direct the stoppage of all exploitation by the state governments of the area in question till such time as the directions of the central government are carried out. Anyone who violates such directions or abides in the violation of the same shall be liable for punishment as mentioned in Section 78 (Section 27(A)). This and similar such provisions may exacerbate the conflicts between the central government and the state governments.

Protected Forests: Chapter three is related to matters connected with protected forests. In the Act of 1927, there was no provision to declare a protected forest to be not protected. However, such a power was presumed and was exercised by the state governments from time to time. In the proposed Act, strict provisions have been made to declare protected forest as no more protected. It is provided that "the state government may, by notification in the official gazette, direct that from a date fixed by such notification, any land or any portion thereof protected under this Act shall cease to be a protected forest, provided that, no such notification shall be issued unless a clearance has been obtained from the central government or any officer so empowered by the central government in this behalf; provided further that no such clearance shall be granted by or on behalf of the central government for regularisation of unauthorised occupation of any protected forest or portion thereof, if such occupation is of a period after coming into force of this Act, without a resolution to that effect being passed by both the houses of parliament" (Section 34(1)).

The provision is very complicated and will obstruct the execution of development projects covered under protected forests.

Village Forest: The three-fold classification of forests, viz, reserve, protected and village forest, in the Act of 1927 has been followed in the proposed Act. However, village forests were given little importance in the Act of 1927. There was only one small section dealing with the village forests in the Act of 1927 (Section 28). In the proposed Act, there are several provisions relating to village forests. National Forest Policy Resolution has emphasised people's participation in forest conservation and management. The government of India is encouraging the practice of joint forest management. It is, therefore, natural that these ideas should find place in the proposed Act. Provisions relating to village forests are quite important from the point of view of adivasi and other forest dwelling communities and need a close scrutiny.

Under the proposed Act, state governments are empowered to constitute village forest over any land (except land under reserve forest) over which it has proprietary rights or any land at the disposal of the village community or to which the village community has access by way of any right, concession or privilege, with a view to conserve or develop such land or to manage it on the principles of sustained bio-mass production for the collective benefit of the said village community.

Village forests are to be managed through the village community and guidelines for such management have been laid down in the proposed Act. Before constituting a village forest, an authorised officer of the state government shall ascertain the extent and nature of the rights of government or of private persons or of villagers other than the village to whom the said forest is to be entrusted for management. The village shall be represented by its panchayat or any other local body representing the village. These rights should be extinguished, or, where this is not possible, two or more villages should mutually agree to share the usufructuary rights, before the notification of the village forest is made, subject to the rights of individuals, the government or any other village. The village concerned shall enjoy the usufructs, fuel-wood and other rights and privileges in accordance with a management plan prepared by the local body in consultation with the designated representatives of the forest department. The management plans shall also prescribe the duties of the villages in matters relating to the protection and management of such forests.

The village community, individually and the local body collectively, shall restrict the usage of the village forests to the extent and nature provided for in the management plan. The management plan shall also recognise the usufructuary rights, including those over grass and fuel-wood, of any individual of the

community who has been responsible for the raising and the protection of the specific forest produce. It is clearly stated that the proprietary rights of the state government shall be protected. The local body has been empowered to levy a compensation, not exceeding Rs 3,000 on any person who violates the rules laid down for the maintenance of village forests.

Ultimately, the power of control over the village forests will be in the hands of the state government. It is laid down that where the state government or its authorised officer is satisfied that the local body or the residents of the village are either unable to protect the village forest or to abide by the prescribed management plan, the state government or the authorised officer may pass an order taking over the management of the forest after giving the villagers or the local body an opportunity to present their case.

The local body is supposed to undertake certain functions. It is laid down that "the local body shall... (1) as far as possible, afforest all land under its charge and embarkments of roads, canals, railway lines, tanks and the like; (2) regulate the grazing of cattle on such land under afforestation for such period and in the manner deemed fit and shall make every possible effort to improve such land by reseeding of grasses, planting of fodder or in any other appropriate manner; (3) encourage plantation of trees and groves on the private landholdings by the respective owners and raise nurseries to provide seedlings and other planting material for the same, on such terms as may be deemed fit" (Section 34, AA2).

There is also a provision empowering the local body to assign a part of the village forest or the land under its charge to individuals for afforestation and protection on mutually agreed terms and conditions including enjoyment of usufructs and other forest produce. It is recommended that in such allotment preference should be given to the landless, marginal and small farmers of the village, in that order. If the individual to whom such land is allotted uses that land for any purpose other than afforestation and cultivation of grass and fodder, he shall be summarily evicted and shall also be liable to punishment. The proposed Act empowers the local bodies to levy a special tax to provide funds for protection and development of village forest and community lands, and for afforestation and grass and fodder development on private holdings. This power is likely to be misused to the advantage of the rural powerful and rich in the villages.

Village Forest Development Fund: The bill provides that "the state government shall establish a special fund called the Village Forest Development Fund and shall contribute to such fund annually an amount which shall not be less than 5 per cent of the gross revenue of the forest department of the state and 25 per cent of the forest development tax to be levied under the provisions of this Act". The state government can, from the village forest development fund, advance loans to the local bodies managing village forests for afforestation and development of such village forests. The loans so advanced shall be recovered from the local body from the revenue received through the sale of forest produce harvested from the village forests. The above-mentioned provisions appear to be very liberal. However, there is a provision that makes a mockery of all these pious proclamations. This provision says that the state government may declare all or any of the provisions of chapter three relating to protected forests to be applicable to village forests. Thus, it can declare any village forests as protected forests keeping the sword of damocles hanging over the local body managing a village forest (Section 34, AA4).

We mentioned earlier that the government can constitute a village forest on any land except the land under the reserved forests. There is a possibility that some of the degraded lands under protected forests will be transferred to constitute village forests. There is a special provision for such lands transferred from protected forest to village forest. It says that wherever the village forest has been created out of any protected forest, all the provisions of chapter three (relating to protected forest) shall apply a priori to such village forest or part thereof (Section 34, A(a)4). This provision nullifies all the concessions given for the development of village forests. This is not joint forest management but a subservient assignment.

Forest on Non-Government Lands: There were some provisions in the Act of 1927 to control forests over lands that were not the property of government. There are numerous elaborate provisions in the proposed Act to regulate and control what may be called private forests. The state governments have been authorised to prevent activities like breaking up or clearing of land for cultivation and tree felling for certain purposes after giving an opportunity to the person concerned to present his case. If the person concerned fails to comply with the directions given by the state government, it can take over management of such forests or natural ecosystems. During the period of management, the state government shall receive all the revenues from the working and management of forests and shall pay the original owner the compensation decided by it after taking over of management. The state government can terminate such management and hand over possession to the original owner.

A provision is made for the protection of forests or natural ecosystems on the request of their owner(s). Such a provision is made for the first time in the forest legislation.

Tree Grower: Another very peculiar provision is for the registration of tree grower. It is provided that any owner may register himself as a tree grower with the divisional forest officer in respect of such land on which he has raised plantations in the manner prescribed by the state government. The state government may prescribe certain criteria for eligibility for registration like minimum number of trees, minimum area of plantation or both. Any registered tree grower may use as he likes the forest produce on his plantation and may fell the trees with prior permission of the authority in case such permission is necessary. If such permission is not granted within 60 days of the receipt of intimation, it shall be deemed as granted. The registered tree grower can request for permit to transport the forest produce from his plantation to some other place for processing or sale. The state government can extend facilities and technical advice to the registered tree grower. The divisional forest officer can cancel such registration after recording reasons in writing and giving the tree grower an opportunity of being heard. All these provisions are basically for raising plantations by the companies and firms. It is already provided in the definition that persons include a firm or a company. Thus companies are assured that if they are registered as tree growers, they will be eligible to obtain permits for felling of trees and their transport

Tree growers acquire a unique exemption under the provisions of the proposed Act. It lays down that notwithstanding anything contained in any other law for the time being in force, any land which is utilised by the owner for the purpose of tree growing or raising grass and other fodder shall be deemed to be plantation forest and shall not be included in agricultural landholding for the purpose of ceiling laws (Section 38 D). This exemption is available to only registered tree growers and not for plantation of horticultural species like tea, coffee, palm and rubber. In the draft of the national forest policy resolution circulated in 1987, there was a provision that exemption from the existing land ceiling laws should be given to new plantations on degraded lands outside the forest (Section 4(9)). This was dropped when the resolution was presented to the parliament. This provision is now brought back for registered tree growers. This may encourage individuals and companies to evade land ceiling laws and will again give rise to the ownership of big landholdings by individuals and especially companies.

Plantation on Private Lands: The proposed Act contains some provisions to assist the owners for raising plantations on their lands. As pointed out earlier, the owner may be a person, a firm or a company. An owner can request for assistance after giving details of the land to be bought under plantation, species to be planted and other related information.

After due investigation, the divisional forest officer can offer to provide requisite financial or other assistance including planting material on mutually agreed terms and conditions. The state government may provide loans and subsidy for raising a plantation, its management and harvest, and prescribe the method of recovery. The owner shall not alienate the land or the ownership of plantation except in the manner provided for in the agreement. The owner shall be entitled to the forest produce in accordance with the provisions in the agreement.

Assignment of Government Land to Individuals for Afforestation: The bill proposes to empower the state government to assign government land to individuals for the purposes of afforestation. However, the government cannot assign any land from reserved or protected forests. The procedure for such assignment can be the same as the assignment of village forest lands to individuals laid down in Section 34 AA. The assignee shall be entitled to usufruct from the plantation raised by him and also to the final harvest. The government can take back the assigned land if it finds that the terms and conditions of the assignment are violated.

Agro-Forests: It was mentioned above that the state governments are asked to stop the practice of shifting cultivation in the protected forests. However, if the practice of shifting cultivation is on any land owned by an individual or a community, the state government may declare that land as agro-forest. The procedure for constituting agro-forest is the same as for constituting village forests (Section 38, F, 2f). However, the state government shall not constitute any agro-forest in an area having overall gradient of more than 30 degrees. The central or the state government may make rules for the management of agro-forests, prescribing minimum period of protection for shifting cultivation requiring clearing of trees, and for providing financial and technical assistance in the management of such forests.

Prohibition on Felling of Trees: The state government is empowered to prohibit cutting, damaging, destroying, felling or removing any class or kind of trees in any urban or rural area or part thereof. The state government can constitute a Tree Authority for the notified urban and rural area and lay down duties and powers of such authority.

Duty on Timber and Other Forest Produce: The central government may levy a duty on all timber or other forest produce which is produced in the territories under the jurisdiction of the Act or which is brought from any place outside the territories under its jurisdiction. The state government can continue to levy any duty on all timber and other forest produce until a provision to the contrary is made by the parliament. In respect of forest produce disposed by the state government by sale or otherwise, the state government may levy a duty called Forest Development Tax at a rate not exceeding 15 per cent of the value assessed or amount of consideration paid therefor. This tax shall be in addition to any duty or tax payable in respect of such produce under any other law in force. The amount received from the tax shall be deposited in a special fund and shall not be a part of the Consolidated Fund of the state. The amount shall be used exclusively for re-forestation, forest protection and other auxiliary purposes connected with tree planting, forest development programmes and the welfare of the people dwelling in forest, and of the weaker sections of the people dependent on forest produce for their livelihood.

Control of Trade, Possession and Transit of Timber and Other Forest Produce: Several provisions have been made to control the trade, possession and transit of timber and other forest produce. It has also been provided that no person shall manufacture within a reserved or protected forest or within two kms from the limits of such forests, charcoal, lime, bricks, catechu, catechin and any other product which requires timber, fire-wood or any other forest produce for its manufacture. Provisions are also made to prohibit and regulate the establishment of a sawmill or a sawpit in any specified area and for the collection of drift and stranded timber.

Offences: Punishments for several offences under the provisions of the proposed Act have been provided for. All offences under this Act shall be cognisable and any forest officer, police officer or revenue officer, may, without order from a magistrate and without warrant, arrest and detain in custody any person who has committed any offences under this Act.

Cattle Trespass: There are provisions to regulate trespassing of cattle in reserve, protected and village forests. Penalties for such offences have been made very severe.

Assessment

On the whole, the proposed Act is based on the National Forest Resolution of 1988. There is a definite change from the colonial and regulatory tone of the Indian Forest Act of 1927. The provisions relating to village forests and regulation of sawmills introduce desirable changes.

However, certain provisions go against the interests of the people, particularly adivasis and other forest dwelling communities, and should be modified or deleted. Such is the provision that the forest settlement officer shall not, except with the prior approval of the state, admit a claim to pasturage or forest produce in the proposed reserve forest if the claimant is not a resident of a village or town with contiguous boundary with such forest or is a beneficiary of any village forest or part thereof. The proposed Act encourages the constitution of village forest and it is possible that a number of village forests are constituted in the near future. Many of those with some rights over the produce in village forest may also be the gatherers of non-wood forest produce in reserve forest. This provision will very harshly affect them and, therefore, it should be deleted. It is provided that notification to de-reserve any reserved forest by the state government can only be issued after a clearance has been obtained from the central government. However, no such clearance shall be granted by the central government for regularisation of unauthorised occupation of any reserve forest or portion thereof, if such occupation is of a period after coming into force of this Act, without a resolution to that effect being passed by both houses of parliament. While it is necessary to see that there are no further encroachment on any land under reserve forest, this can be done without making it subject to a parliamentary resolution. The provision implies that the state governments and even the central government cannot be trusted to check the encroachment on reserved forest land. A similar provision has also been made in the case of protected forests and needs deletion. The control of the forest department over the management of village forests has been very rigorous and may lead to conflicts between the village community and forest officials. These provisions need to be amended. The provision that whenever the village forest has been constituted out of a protected forest, all the provisions relating to protected forests will apply to it or part thereof, is quite unnecessary and repugnant to the spirit of the constitution of village forest.

It is possible that the exemption of the plantations of a registered tree grower from the Land Ceiling Act may be misused by rich individuals and particularly big corporations. A similar provision in the draft of the National Forest Resolution was deleted when it was submitted to the parliament. On the whole, the Act is definitely an improvement on the prevailing Indian Forest Act of 1927 and the one that was proposed in 1980. It can be further improved if the changes indicated above are made before it is introduced in the parliament.

Distorted Perspective on Health Care

Thomas George

The only solution to the many problems of providing health care for all would be a nationalised health system.

DESPITE all the rhetoric about "adjustment with a human face" that the Narasimha Rao-Manmohan Singh and the pro-government Media Cabal have been dishing out, there is absolutely no doubt that the government of India's structural adjustment programme (SAP) is having deleterious effects on social welfare. Confirmation for this fact comes from no less a source than the World Bank itself, the prime motivator of the programme. In its *India Health Financing Study* (May 1993) a country-specific document complementary to the better known *World Development Report* 1993, it says, "In the face of budgetary pressure and the start of the adjustment process, the health sector faces a critical decision point today" (p 88). The Bank was acutely concerned because the very first budget under the SAP drastically reduced the already meagre allocation for health. In the 1992-93 budget, central allocation to health was Rs 303 crore the same as the previous year. However, this included Rs 58 crore, for AIDS control committed by the World Bank. So in fact, the actual allocation was Rs 245 crore, a cut of 20 per cent. The ministry of health and family welfare absorbed this fierce reduction by simply slashing allocations for various important programmes. Thus, for example, the National Malaria Eradication Programme got Rs 50 crore compared to Rs 83 crore the previous year, allocation for tuberculosis was cut from Rs 16 crore to Rs 13.5 crore and some ongoing programmes like the control of encephalitis, filaria and guinea-worm received no funds at all. The World Bank was worried that too much and too sudden a reduction in social welfare activities would provoke widespread unrest. Subsequent budgets have reflected the Bank's concern and there has been some rise in allocations for health although even today it remains a miserable 0.58 per cent of the budget.

The fundamental problem with health care provision in India is that it is seen as a gift bestowed on the (undeserving?) poor by a paternal government, and not as a right inseparable from the right to life. In spite of the excellent and erudite recommendations of numerous committees, of which, undoubtedly the Bhore Committee was the finest, only a parody of a universal health care network exists. The government—both central and state—plead paucity of resources. This cry is echoed by the World Bank too. But the hollowness of this argument has been repeatedly exposed, most recently in "People's Health in People's Hands" (Foundation for Research in Community Health, Bombay) which documents how a complete and comprehensive health care system would cost only Rs 150 per capita, simultaneously addressing the needs of the people and the professional aspirations of the health care personnel.

However a necessary prerequisite for the success of this system is a responsive social ambience, i e, a society in which policies are not determined by a greedy few who manipulate everything to their narrow ends, but by the people at large.

Since the World Bank is not generally troubled by such esoteric considerations as the creation of a more egalitarian society, it concentrates on the symptoms of the illness, rather than on the underlying rot in the system.

Hence it identifies the chief causes of the failure of the public health system in India as: too much emphasis on hospitals at the cost of primary health centres; hospitals depend too much on grants from the government and make little effort to recover costs through user fees, and medical education is heavily subsidised and takes away a large part of the budget for health.

Although much of the criticism it makes is eminently sensible, it is also eminently superficial. Thus, for example, it is true that the PHCs lack medicines and basic equipment, that vehicles are often without fuel or drivers, that health care personnel are apathetic, or worse not present at all. But all these are not primarily due to poor management, and will not respond to quick-fix solutions. They are rather symptomatic of a social system in which the needs of the general public- who are the users of government facilities- are simply ignored or at best minimally provided for to ensure social peace. It reflects the power relations in which an elite rules in the name of the people but behaves much like the Raj of yester year.

It is true that many honest and concerned people have remarked on the overemphasis of hospital-based care. But there is a qualitative difference between this criticism and that of the World Bank—the former recognises that the basic cause of most mortality and morbidity in India is due to poverty and its multiple manifestations notably, communicable diseases arising out of poor water and atrocious sanitation. They, therefore, suggest that poverty eradication should be the basic goal of development activities. Important secondary goals should be provision of safe water and sanitation. But this should not be at the cost of shutting down the already minimal hospital care facilities. In effect, the World Bank's advice that hospitals should be self-supporting and that the money should be 'redirected' to primary health care means starving them of the means to keep functioning. Anyone who has utilised or even visited a government hospital—with a very few exceptions—will know that they are no islands of opulence. In fact, they are barely pulling along and their closure will mean misery for the poor who use them. User fees are a mere mirage, for no one who can afford anything uses a government hospital bribes ('transaction costs' as the World Bank calls them), notwithstanding, they are the only source of surgical and even minimally advanced medical care for the poor.

The natural corollary of subsidised medical education would be a nationalised health system. It is the government's abdication of its responsibility in this regard, and it's not merely permitting but encouraging a rapacious private sector that has allowed "high private returns" from medical education. The entire philosophy of ensuring low cost medical education is to ensure low cost medical care. And this can come only from a nationalised health system. Any fear that it will be inefficient is ill-founded. In countries with social systems as different as the UK and China, nationalised health systems have proved highly effective. Accountability is the key and a responsive health system will be almost natural in a responsive society. In brief, what India needs is an accountable, decentralised, nationalised health system, the funds for which can be found by redirection from wasteful sectors like defence.

The World Bank, however, hemmed in by its twin concerns of ensuring low taxes which means little money for social welfare, while simultaneously maintaining social peace, attempts to manoeuvre in the strait-jacket of the budget. It is no wonder, therefore, that these recommendations are either vague or superficial. Their desire to maintain the present unequal social structure pre-empts any meaningful and far-reaching reform. Instead of redesigning they are content with tinkering and that is why following this policy document will mean that 'Health for All' continues to remain a distant dream.

The British Bank of the Middle East

(Incorporated in England by Royal Charter 1889)

SCHEDULE 17

NOTES FORMING PART OF THE FINANCIAL STATEMENTS FOR THE YEAR ENDED 31 MARCH 1994

1. The financial statements for the year ended 31 March 1994 reflect the results of the Indian Branches of The British Bank of The Middle East ("the Bank"), which is incorporated and registered in England. The Bank's ultimate holding company is HSBC Holdings plc, which is incorporated and registered in England.

2. Principal Accounting Policies

(a) General

The accompanying financial statements are prepared on the historical cost basis as modified by the revaluation of certain premises, and in accordance with generally accepted accounting principles and the statutory provisions and practices prevailing within the banking industry in India.

(b) Transactions Involving Foreign Exchange

(i) Assets and liabilities denominated in foreign currencies are translated at the rates of exchange prevailing at the year end, except for those foreign currency non-resident deposits eligible for conversion with the Reserve Bank of India, which are translated at the notional rates applicable to these deposits. Revenues and expenses are translated at the rates prevailing on the transaction date.

(ii) Outstanding forward foreign exchange contracts are revalued at the forward exchange rate prevailing at the year end and the resultant gain or loss is included in the Profit and Loss Account.

(c) Investments

(i) All investments are classified as "Current Investments" and are valued at the lower of cost and markét value in aggregate by type of security.

(ii) Cost represents the acquisition cost adjusted by the amortisation of premium or discount over the period from the date of purchase to the date of maturity.

(iii) Market value for quoted investments is determined based on independent quotations and in the case of unquoted investments by reference to the market yield for instruments with comparable risk and residual maturity.

(d) Advances

Advances are stated net of provision for doubtful advances and interest in suspense. Provision for doubtful advances is made in respect of identified advances based on a periodic review and after considering the provisioning guidelines issued by the Reserve Bank of India. Interest on doubtful advances is credited to interest in suspense account and not recognised in the Profit and Loss Account until received.

(e) Fixed Assets

(i) Fixed assets are stated at historical cost less accumulated depreciation, with the exception of premises which are stated at valuation or cost less accumulated depreciation.

(ii) Depreciation is provided on the straight-line basis at the rates prescribed under Schedule XIV to the Companies Act, 1956.

(iii) Depreciation on the revaluation of fixed assets is charged to the Profit and Loss Account and a corresponding transfer is made from Capital Reserve to the Profit and Loss Account.

(f) Staff Benefits

(i) Provision for post-retirement benefits in respect of approved pension fund is made based on actuarial valuation conducted by a qualified actuary.

(ii) Pension payments to staff who retired on or before 31 December 1982, prior to the creation of the approved pension funds, are accounted for on a cash basis. The annual cost of this pension is Rs. 278000.

(iii) Monthly payments made under the Voluntary Retirement Scheme introduced in 1992 are also accounted for on a cash basis. The liability at 31 March 1994 in respect of this scheme is Rs. 3.5 million, provision for which is not made in these financial statements.

(g) Net Profit

The net profit disclosed in the Profit and Loss Account is after:

(i) provision for any depreciation in the value of investments;

(ii) provision for doubtful advances;

(iii) provision for taxation;

(iv) provision for other unusual and necessary expenses;

(v) charge for head office expenses.

3. Fixed Assets

The most recent valuation of the freehold premises was conducted by independent professional valuers in November 1992 and the results of the revaluation were included in the Balance Sheet as at 31 March 1993.

4. Taxation

There is a contingent liability for assessment year 1991–92 of approximately Rs 33 million which is presently in appeal.

5. Foreign Currency Non Resident Deposit Scheme 'A' (FCNR 'A')

The Reserve Bank of India, during the course of the inspection of interest claim on FCNR 'A' deposit scheme made by the Bank for prior years, observed deficiencies/irregularities in the interest calculation Accordingly, the Reserve Bank of India has requested the Bank to recalculate the amount of interest admissible for the relevant period and refund the excess interest, if any, drawn by the Bank. Liability for the above amount at the Balance Sheet date is not ascertainable.

6. Previous year's figures have been regrouped and reclassified as far as practicable and wherever necessary.

The British Bank of the Middle East

(Incorporated in England by Royal Charter 1889)

AUDITORS' REPORT ON THE FINANCIAL STATEMENTS OF THE INDIAN BRANCHES OF THE BRITISH BANK OF THE MIDDLE EAST UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949.

We have audited the Balance Sheet of the Indian Branches of The British Bank of the Middle East (incorporated in England by Royal Charter 1889) ("the Bank") as at 31 March 1994 and the related Profit and Loss Account for the year then ended. We have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our audit and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of the Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not drawn up, in accordance with Schedule VI of the Companies Act, 1956. The financial statements are therefore drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

In respect of the matter mentioned in Note 5 to the financial statements, we are unable to form an opinion on its outcome and consequently its effect, if any, on the results of the Bank for the year.

In our opinion, subject to the effect of the adjustments, if any, that might have become necessary had the outcome of the matter referred to in the previous paragraph been known, the financial statements give a true and fair view of the state of affairs of the Bank as at 31 March 1994 and of its profit for the year then ended.

We further report that:

(a) the financial statements are in agreement with the books of account and give the information required by the Companies Act, 1956, in the manner so required for banking companies;

(b) the Bank has maintained proper books of account as required by law insofar as appears from our examination of those books;

(c) the returns received from the branch of the Bank have been found adequate for the purposes of our audit;

(d) the transactions which have come to our notice have been within the powers of the Bank.

Banking Services Review

The uneven regional distribution of banking operations needs to be corrected.

THE recently released Reserve Bank of India's publication, *Banking Statistics, Basic Statistical Returns, 1992*, represents an organised and well-conceived effort at making available to the general public crucial information on the quantitative aspects of banking operations and development in the country. It also highlights the role of banks in the country's financial development. Basically, the data presented in the latest volume relate to the position as on March 31, 1992, although some macro-dimensions as on March 31, 1993, have also been incorporated. However, no explanation is given anywhere for the discrepancy in the figures of deposits, credit, number of offices, etc, presented in Tables 1.1, 1.3, 1.4, 1.7, 1.8 and 1.18.

The synoptic view of the progress of commercial banks since June 1969 presented in the document establish certain well known facts; that the number of scheduled commercial banks rose from 89 in 1969 to 276 as of March 1993; bank offices have registered a spectacular increase from 8,262 to 61,169; population from office improved from 64,000 to 14,000; rural branches accounted for 58 per cent as against 2 per cent about two-and-a-half decades ago; share of priority sector advances moved up from 14 per cent to 44 in June 1988, although it slipped to 37 per cent by March 1992; industries continued to appropriate higher proportion of bank credit (at 48 per cent, albeit its share was drastically reduced) while the share of trade and agriculture was almost equal around 14 per cent and that percentage of 'satisfactory' assets of the bank formed 74 per cent, and "bad and doubtful debts" stood at as low as 2.4 per cent of outstanding credit as on March 1992, about 76 per cent of bank credit was extended at interest rates of 15 per cent above and 56 per cent bank credit outstanding was in the credit limit range of Rs 10 lakh and above. But small borrowal account (Rs 25,000 and less) accounted for as much as 95 per cent of total accounts and 22 per cent of outstanding credit.

This string of statistics, impressive in themselves, indeed tend to concede regional disparities in banking development: The southern region with a rich banking tradition and a developed western region well ahead of a relatively backward eastern region and a poor north-eastern region. About 27 per cent of total bank offices were located in the southern region, 21 per cent in the central region, 18 per cent in the eastern region and 15 per cent in the western region. Although the southern region had the highest number of bank offices, the western region topped in the matter of deposits and credit with a share of about 29 per cent each. The total bank offices in the north-eastern region (Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland and Tripura) constituted about 3 per cent of the total, with a deposit share of 1.6 per cent and a credit share of 1.3 per cent in the total. But for the higher level of deposits and credit in Assam, the position would have been still more appalling. The proportion of rural offices at about 73 per cent in the north-eastern regions was markedly higher than the national average of 56.7 per cent. Deposits mobilised by rural branches amounted to 27 per cent of total deposits in the north-eastern region and credit disbursed by them amounted to 34 per cent of the total. The corresponding all-India average worked out to 15 per cent each as at the end of March 1992. The performance of rural branches in the north-eastern region both in deposit mobilisation and credit deployment compared favourably with urban and metropolitan branches, unlike at the national level where 25 per cent of branches in the urban area were responsible for 65 per cent of deposits and 69 per cent of credit. Keeping with the position of highest number of offices the southern region had the highest number of employees (25 per cent of the total no of employees). The share of the north-eastern region was about 2 per cent of the total; officer staff formed about 27 per cent in all the regions.

Distribution of deposits according to type showed that in the north-eastern region savings bank deposits had a higher share of 35 per cent in the total deposit mix as compared with the national average of 26 per cent. However, fixed deposits were dominant in the total. Of the new deposits, current accounts formed 32 per cent; the all-India average was as low as 12 per cent.

The southern region reported highest incidence of overdues. The region's share in the total overdues of scheduled commercial banks amounting to Rs 14,056 crore was about 38 per cent, which was largely (49 per cent) in the books of urban and metropolitan branches. Bank branches in the north-eastern region had overdues of 1.7 per cent of the total. But unlike in the developed region, the incidence was higher in rural branches (accounting for 45 per cent of the region's overdues as against the all-India average of 21 per cent).

State and population group-wise classification of credit as per sanction and utilisation were quite revealing in that in the eastern, the northern and the western regions, the utilisation was less than what was sanctioned implying that there was an outflow of funds or migration of credit into other regions. The southern, north-eastern and central regions experienced an inflow of resources as the amount utilised far exceeded the amount sanctioned. At the aggregate level while in the rural, semi-urban and urban areas the amount utilised was higher than was sanctioned, the metropolitan areas presented a contrary trend. At the end of March 1992, there was an outflow of bank funds to the extent of Rs 8,556 crore from these areas to rural, semi-urban and urban areas. Significantly about 80 per cent of these resources were absorbed in rural areas. Predictably, the trend was substantially the same in all the regions. This finding highlights the fact that although the metropolitan as well as the urban branches could be credited with higher deposit mobilisation and credit expansion, the real beneficiaries of bank credit seemed to be the entities in rural, semi-urban and urban areas.

To conclude the RBI could make use of the results thrown up by the audit for correcting the distortions in the banking operations. For instance, bank branches in the southern area could be exhorted to improve their productivity and bring down the incidence of overdues particularly in the urban areas. Similarly banks could be prompted to improve their presence and activity in the north-eastern area and improve the overdues position in the rural areas. Delving deeper into these statistics one could possibly come up with more such policy ideas.

Globalisation, Demystification and Schism in Tibetan Buddhism

Stig Toft Madsen

For Tibetan Buddhism the exile in India and the west has meant not only survival but the possibility of gaining followers from around the world. Globalisation has however, accentuated internal weaknesses and contributed to demands for reform. The dispute relating to the appointment of the 17th Karmapa, reincarnate head of the Kagyupa sect, shows the difficulties of accommodating all Kagyupas under the same hat

IN 1959 Tibet's theocratic polity was shattered and the Tibetan people were subjected to a tragic confrontation with Chinese communism. According to the Tibetan exile government more than 1.2 million Tibetans died as a direct consequence of the Chinese take over while some 6,000 monasteries and temples were demolished [Office of Information and International Relations 1990: 5 and 71]. These figures may be an exaggeration [Sethi 1993], but there is little doubt that Tibetans have had their share of suffering.

The possibility of asylum in India, Sikkim, Bhutan, Nepal, Europe and America was crucial to the survival of Tibetan culture. Considering that the Tibetans fleeing Tibet had little experience of the world outside Tibet, they managed the transition well. But in exile they had to work hard to protect their culture from that of their host countries. This problem was exacerbated by the very success Tibetan Buddhism achieved outside Tibet. Tibetan Buddhism did not isolate itself in exile, but already by the late 1960s emerged as an active proselytising movement in the west. For those spiritual seekers in the west who were not drawn towards the institutionally less embedded Hindu gurus, Tibetan Buddhism appeared as an authentic and authoritative Asian religious alternative.

The doctrine of reincarnation common to Indic religions has achieved special importance in the tantric form of Mahayana Buddhism prevalent in and near Tibet. According to this form of Buddhism a limited number of compassionate and enlightened beings voluntarily choose rebirth as humans to guide others onto the path of salvation. Once, recognised as reincarnations such persons are known as tulkus. Many positions in Tibet's ecclesiastic hierarchy were and are filled by tulkus. In the Kagyupa sect with which this article is chiefly concerned the power and duty to recognise install and educate the head of the spiritual lineage or school has been entrusted a group of regents or "lineage holders", who are themselves tulkus.

This system of succession to high office was invented by the Kagyupa sect in the eastern part of Tibet in the 12th century. The head of the school, the Gyalwa Karmapa, has generally been recognised on the basis of a 'prediction letter' written by him before his death and subsequently found and used by the regents to find his next incarnation. There is no prescribed period within which the Karmapa has to be found but it is presumed that Karmapa usually incarnates in only one human being at a time.

The history of Tibet tells of intrigues and power struggles associated with the running of this polity. During periods of Chinese suzerainty the Chinese resorted to short listing the candidates for the positions of Dalai Lama and Panchen Lama and drew lots between them [Stein 1972: 88].

The play on chance and the fact that tulkus have often been found among commoners added flexibility to a political system otherwise dominated by aristocratic families. However the system is difficult to harmonise with the criteria of appointment prevalent in the countries in which the Tibetans now find themselves. The depth of the difference between the Tibetan system of succession to high office and a system based on merit earned in this world may be illustrated by contrasting the Tibetan doctrine of reincarnation with the theory of the liberal philosopher John Rawls.

According to Rawls, rational persons placed behind 'a veil of ignorance' in an imagined original position in which they do not know anything about their own future and in which they do not have a past, will choose to design a society in which all positions are in principle open for all as that will optimise the life chances of each of them [Rawls 1993].

In contrast to such a veil of ignorance, Tibetan philosophy may be said to postulate 'a veil of knowledge'. In the Tibetan equivalent of the original position, i e, the 'bardo' phase between death and rebirth, those who possess knowledge have the ability to choose their future. Others with no such knowledge or wisdom are propelled in and out of this world by accumulated karma. In this manner the possession of pre-birth knowledge becomes the criterion for receiving positions of power in society, while the lack of such knowledge excludes others from achieving certain crucial positions.

The Tibetan view presumes that the key players in the game of recognising tulkus are informed by Buddhist ideals and virtues as they, too, are tulkus operating from positions of knowledge. If a situation arises in which common believers perceive chief players to be motivated by considerations of personal, economic and political power in their choice of incumbents of high offices, a crisis of governance may develop. In contemporary conditions such a crisis is likely to deepen as many believers are familiar with more transparent decision-making processes.

Pressures for reform have, indeed, been building up. One of the most persistent advocates of reform, surprisingly, has been the present Dalai Lama who has tried to change the political system he himself embodies by promulgating a charter for the Tibetans in exile granting universal suffrage as well as equality. "Before the law all Tibetans are equal regardless of sex, race, language, religion, monks or laymen, wealth, birthplace, social class and position" [Thargyal 1993: 37]. The liberal political reforms initiated by the Dalai Lama have been opposed by many of his more conservative followers who consider the civil and political rights thrust upon them by the Dalai Lama too radical (ibid). In his attempts to extricate himself and the system he represents from the past, the Dalai Lama has also been searching more democratic and transparent methods of religious succession without, however, entirely abandoning the doctrine of reincarnation [Nash 1992].[1]

Dalai Lama is the head of the Gelugpa sect. In contrast to the Gelugpas, the Kagyupas had not till recently moved far from orthodoxy.

Rivalry

In 1981 the head of the Kagyupa school, the 16th Gyalwa Karmapa, died in US. The Karmapa Charitable Trust, which he had created to oversee the running of the Rumtek monastery in Sikkim and, in principle, to head the approximately 500 other monasteries and centres around the world, asked the four regents to seek his 17th incarnation. The four regents so empowered were Situpa, Gyaltsab, Kongtrul and Shamarpa.

The regents were under considerable pressure from Tibetans and others to find Karmapa's new incarnation and at one point announced that they had found the prediction letter. Later they admitted that this was a ploy to gain time [Nesterenko, 1992: 124].

Gradually, a rift surfaced. Two hundred years ago Dalai Lama forbid Shamarpa to reincarnate himself. However, in 1964 the present incarnation of Shamarpa was discovered by the 16th Karmapa in the person of his own nephew [ibid, p 8 and Dronma

1992: 41, 47]. The hitherto foremost regent, Situpa, apparently saw Shamarpa as a challenger. When another nephew of Karmapa, Topga Yulgyal, who was married to a niece of the Bhutanese king, later became *inter alia* the secretary-general of the Karmapa Charitable Trust and of the Rumtek Dharma Chakra Centre, rumours spread that Shamarpa was trying to establish control over Rumtek. Shamarpa denied this, but added that he had been given a hint as to the identity of the coming Karmapa [Nesterenko: 86, 137; Zangmo 1993: 61-64; Dronma: 59]

Shamarpa did not produce a candidate. Instead, Situpa took the initiative on March 19, 1992, he announced at a meeting of the regents in Rumtek that a talisman, which he had been presented by the 16th Karmapa, had turned out to contain the prediction letter. The letter indicated that Karmapa would be reborn in the eastern part of Tibet. Shamarpa and, arguably, Kongtrul did not accept the authenticity of the letter and demanded that it be submitted to a graphological test.[3] While the recognition of a tulku often involves various quasi-scientific tests during which a candidate is asked to recognise belongings from his earlier lives, the demand for a graphological test is not a part of tradition, but aimed at challenging Situpa. The regents seem to have decided that Kongtrul should proceed to Tibet to find the incarnation and that the prediction letter should not be made public until his return. However, Situpa released the contents of the letter the day after this meeting.

On April 26, 1992, Kongtrul died in a car accident which may well have been caused by rash driving, but which gave rise to rumours of foul play. In May, Situpa and Gyaltsab announced that they would send a delegation to Tibet. Simultaneously, they attempted to secure physical control over Rumtek monastery. This happened while many overseas Buddhists were in Rumtek to learn about the reborn Karmapa. The intrigues, the intimidations and scuffles, and the presence of the dead body of Kongtrul in the monastery's yard seem to have had a disenchanting effect on many believers, including westerners.[5]

On June 6, Situpa and Gyaltsab went to dharamsala to get Dalai Lama's acceptance of the prediction letter. As Dalai Lama was in Rio attending the Earth Summit, the prediction letter was faxed to him in Rio. It is not clear whether the Dalai Lama knew that the three regents were not in complete agreement. In any case, his exile government officially accepted the prediction letter on June 30, after his return from Rio.

On June 7, Shamarpa reached Rumtek after a trip to the US. Under pressure from his teacher and Dalai Lama's acceptance of the letter, Shamarpa agreed to drop the demand for a graphological test. He subsequently left for Europe where he mobilised his western followers.

Meanwhile, the delegation fielded by Situpa and Gyaltsab had made contact with the reincarnation of the 16th Karmapa, a seven-year old boy named Ugyen Thinley born in a poor nomadic family. With the concurrence of the authorities in Tibet, the boy was brought from eastern Tibet to Tsurphu monastery, the original seat of the sect in central Tibet, where he was enthroned as the 17th Karmapa on September 27, 1992 in a ceremony led by Situpa and Gyaltsab [Sattaur 1992: 45; Snow Lion Newsletter 1993: 8]. Tsurphu monastery was under renovation after having been partly demolished by the Chinese.

Already at the death of the 16th Karmapa, converts to Tibetan Buddhism considered themselves an integral part of the spiritual lineage. For example, at a meeting in Rumtek in 1981 a Buddhist from New York said that the fact that Karmapa chose to die in US, showed that the new Buddhists shared a responsibility for the future of the lineage [Nesterenko: 161]. Through labour and financial contributions, the new Buddhists certainly contributed to the spread of Buddhism by enabling Tibetan monks to lecture and live abroad. A few westerners also presided over esoteric rituals. In Denmark, Lama Ole Nydahl received state authorisation to preside over life-cycle rituals.[4]

In the crisis affecting the lineage, the converts did not take a common stand. Some accepted the choice of Ugyen Thinley on the basis of the authority of Situpa and the Dalai Lama. Other followers in Germany and elsewhere opposed the choice arguing that Ugyen Thinley was a tool in the hands of the Chinese government. Their case was presented in a report entitled *The Karmapa Papers* published by Michel Nesterenko in France in October 1992. The prefaces states: "It has become very obvious that 'a Tibetan Rinpoche' does not automatically mean an enlightened person. Since in this respect the western approach had been quite naive so far, this examination might not always be pleasant". *The Karmapa Papers* does not directly question the doctrine of reincarnation, but it attempts a secular and factual approach. On the basis of newspaper reports and the letters and speeches of the regents and others, the report succeeds in shedding considerable light on the chain of events. Subjecting the politics of succession to this form of analysis was a departure from the traditional Kagyupa path.

Such critical attitudes seem to have been most pronounced in some of the Buddhist centres in Germany. Thus, an editorial in *Kagyu Life* boldly stated that "Whereas the Tibetan tradition is superior as regards religion and philosophy, we would like to give them some brotherly advice on the western understanding of democracy as regards transparency and solidarity" [*Kagyu Life* 1992] (my translation).

The Karmapa Papers received a reply in the form of a counter-report entitled *Karmapa Khenno: A Sikkimese Point of View*, edited by the Sikkimese nun Ani Karma Dechen Zangmo and published in 1993 by a number of Sikkimese Buddhist groups. This report, too, consists of newspaper reports, letters, interviews and editorial comments, but where *The Karmapa Papers* attempts an internationalist perspective, *Karmapa Khenno* admits a nationalist Sikkimese stance. *Karmapa Khenno* points out that Shamarpa at several points in time accepted the authenticity of the prediction letter and should not, therefore, have raised doubts later. *Karmapa Khenno* further seeks to establish the authenticity of the prediction letter by means of a graphological analysis.

The *Karmapa Khenno* report mentions that Rumtek witnessed further confrontations between groups of monks and laymen in August 1993. The confrontations were followed by a large meeting. The meeting was critical of two Sikkimese ex-MLAs who had moved the high court of Sikkim questioning the installation of Ugyen Thinley. The meeting found the involvement of the courts unwarranted and dishonourable. Instead the meeting urged the government of Sikkim to take steps to safeguard the sanctity of religion.

In 1994 events took a new turn when Shamarpa finally produced an alternative Karmapa, the 11-year old Tibetan Tenzin Chentse whom Shamarpa claims to have first met in 1986. Unlike Ugyen Thinley, Tenzin Chentse was brought out of Tibet before his identity was made public. On March 17, he was installed as the 17th Karmapa by Shamarpa at Karmapa International Buddhist Centre in New Delhi. The enthronement was marred by violence as monks and laymen opposed to Shamarpa threw stones and bottles at the institute. The event received wide press coverage both in India and internationally [Kutty 1994; Sahgal 1994; Kranti 1994; Penberthy 1994; *The Economist* 1994]. The situation was further politicised when the chief minister of Sikkim asked the prime minister of India to intervene [*The Times of India*, 1994]. The Dalai Lama has sent out various signals, but has not assumed a position as arbitrator.

By April 1994, therefore, there were two rival claimants to the Karmapa title, one occupying the old seat of the Kagyupas in Tibet and surrounded mainly by Tibetans, and another occupying the seat in a new institute in New Delhi and surrounded by German, Russian, Swiss, Hungarian, Polish, Swedish, Danish, Malaysian, American, British, Mexican, Japanese and other converts. The seat of the 16th Karmapa in Rumtek was vacant and the main treasures of the sect remained locked up and under police protection.

The conflict outlined above points to some of the dilemmas facing Tibetan Buddhism

in the modern world. One problem has been to strike a balance between the interests of the Tibetans in Tibet and the interests of Kagyupas elsewhere. To me the fact that the Dalai Lama accepted the choice of Ugyen Thinley is significant because it contributes to the re-establiskment of Buddhism within Tibet with the co-operation of the Chinese authorities. Situpa and Gyaltsab apparently also reached the conclusion that it was important to re-establish Buddhism in Tibet, and on a journey to Tibet in 1991 Situpa took the opportunity to identify a large number of not-so-high ranking tulkus.

By attending to the interests and needs of the Tibetans in Tibet, other interests were sidelined. Shamarpa emerged as the spokesperson of such interests, principally the Buddhist converts. In a speech in Malaysia in 1993, Shamarpa acknowledged that the Dalai Lama as head of the exile government had a special responsibility towards the Tibetans in Tibet, but said that he himself, Shamarpa, chose to focus on Buddhism, including Buddhism in the west [Zangmo: 59-60; and McDonald 1994]. He made it clear that he thought that finding a Karmapa in Tibet had been politically expedient, and that such a politically convenient Karmapa was not necessarily the real Karmapa.

For a period, the rift helped to demystify the process of selection and allowed the world to glimpse the complex motives governing the process. However, the window of opportunity for reform thus opened was not utilised to change the mechanism of succession. After the discovery of the rival claimant, the two factions have been engaged in a symmetrical power struggle which offers no immediate prospects of evolving a new mechanism of succession.

So far, the rule has been that Karmapa reincarnates in only one body at a time. It is conceivable that this rule will be modified so that the two claimants may be mutually accepted as incarnations of different 'aspects' of Karmapa.[5] Such a compromise, however, does not determine who inherits the throne in Rumtek and the black hat worn by the Karmapa. Nor would it necessarily increase the transparency of the succession process.

Notes

[I would like to thank Per Bauhn, Hanne and Ole Bloch-Langskov, Dechen Chungyalpa, Goran Djurfeldt, Eva and Claus Hermansen, Hannah and Ole Nydahl, Gunnar Olofsson, and Hans-Christian Koie Poulsen for suggestions and criticism. The responsibility for the content of the article is, however, mine alone.]

1 For the concept of extrication, see Huntington 1992.

2 According to Nesterenko (pp 34-35), Kongtrul expressed doubts about the authenticity of the prediction letter; others deny this was the case.

3 Max Weber described the world of Mahayana Buddhism as a magical garden [Weber 1968: 255] and used the concept of *entzauberung* for the demystification of such worlds.

4 For his own account of the spread of Buddhism in the west, see Nydahl 1992.

5 Bertolucci's recent film 'Little Buddha' resolves a similar problem by accepting three competing candidates as the incarnations of respectively the mind, speech and the body of a deceased Lama. Following historical precedents, the film also employs an oracle to provide clues to the authenticity of competing candidates.

Ideologues and Ideology

Privatisation of Public Enterprises

Arun Ghosh

The pressure from all international institutions today is for privatisation. Indeed even more dangerous is the ideology that any government intervention in economic activity is bad by definition. However, exponents of 'minimum government' are also strong advocates of the states' involvement in maintaining 'law and order'—to break up militant trade unions, crush organised strikes, and so on.

A STUDY of the history of economic doctrines and of developments around the world would seem to suggest that attempts to explain different patterns and rates of growth of different countries in terms of given ideological premises—capitalist or socialist, and within the capitalistic framework, free market or state interventionist—or even attempts to recommend the adoption of an obviously successful pattern of development in any one country as a model for all others, are full of pitfalls, and are tantamount to a misinterpretation of history. The development of society calls for a holistic view. Development involves social, cultural, even philosophic attitudes, and the organisation of production (and distribution of the product) in a manner that is conducive to development.

Economic organisation is the major factor in stimulating economic growth. Mark the two different words already used in this context: development and growth. They are not synonymous, and yet usually, they are associated together. But let us set that issue aside for the moment.

Economic organisation is in many ways a function of attitudes, of past traditions and culture; and attitudes change with the level of education, of general health and freedom from debilitating diseases. Attitudes also determine work culture and work ethic, but the latter are not 'givens' in any society; they can and do change with the social framework. The much maligned 'casual' character of Indian labour, the temptation of urban workers to go off to their villages from time to time, arises from the fact that the 'roots' of these workers are still in their villages. In fact, in the rural areas, the farmers have to work in season and out, come rain, scorching hot winds or searing cold weather. The cropping season demands whole-hearted attention of the farmer (especially where irrigation makes it possible to raise even three crops over the year). The same farmer migrating to join the urban industrial labour force, with his family left behind in the village, makes at least two trips back home every year; and the Harvard Business School trained manager frets, and bemoans the lack of discipline of the Indian workers as compared to his Japanese counterparts. The 'hire and fire' philosophy—dinned into the manager's consciousness at Harvard—are, however, quite alien to Japanese culture, where workers join a factory for life, content with the security of their jobs. The attempt to introduce either Detroit or Tokyo culture in say, Kanpur, is necessarily fraught with danger.

Let us go back to the fountainhead of development. Even at the cost of repetition, it is necessary to restate Alfred Marshall's prescient words: "Knowledge is our most powerful engine of production... Organisation aids knowledge... The distinction between public and private property in knowledge and organisation is of great and growing importance: in some respects of more importance than that between public and private property in material things..." (Alfred Marshall: *Principles of Economics*: eighth edition, Macmillan, 1947; pp 138-39).

Of almost equal importance today in a world of increasing interdependence—a world getting smaller by the day as a result of the revolution in communications technology—is the external environment. The external environment becomes increasingly more important as the size of the country gets smaller, since its physical endowment necessarily becomes more limited and more specialised, and its dependence on exchanges with the rest of the world more pronounced. Let me state here that this does not warrant 'autarky' for a large country. The frontiers of knowledge are expanding rapidly around the world, and no one would recommend autarky as a necessary condition for development of a large (and hitherto underdeveloped) country. Equally, the attempt to borrow models of development which have succeeded elsewhere—in a wholly different cultural milieu—or even to lay down economic doctrines which are essentially rationalisations of development patterns at given conjunctures of history, would at best reflect extreme *naivete*. The dialectics of change do not follow rules laid down by grammarians.

The 20th century has seen the advent of three distinct economic philosophies. The three major schools of thought are: (a) the classical doctrine that free (and unfettered) trade is best, which—starting with Walrasian 'general equilibrium' theory, and expounded in terms of the 'Pareto-optimum'—has today crystallised into the concept of 'minimum government' (propounded most effectively by Friedrich von Hayek) accompanied by Milton Friedman's monetarist approach which prescribes a monetary policy calculated to bring about zero inflation, no matter what the consequences; (b) the modified Keynesian-cum-Kaleckian approach of state intervention with a view to maintaining full employment, even while keeping in place many of the institutions (and the institutional framework) of a capitalist society; and (c) the Marxian concept of a socialist society, which was given a form by Lenin, after the October 1917 Revolution in Russia. That form, in the erstwhile USSR, differed radically from the Marxian grammar; but that is not the point. The point is, there are now three different patterns or models—on which different experts have built their own approaches to economic growth, with widely divergent models (to wit, the South Korean *vis-a-vis* the Taiwanese approaches, both obvious successes for divergent reasons). However, if one were to study the success of the east Asian countries (as compared to the failure of the effort at development in the Latin American countries), one would be struck by: (a) the early focus on 'education' for all in the east Asian countries, and (b) the extreme inequalities in, and the periodic flights of domestic capital from the Latin American countries. There have indeed been inequalities of income distribution in east Asian countries, but nowhere so stark, nowhere involving palpable destitution of part of the population that has characterised Latin America. But that is another issue. Let us, for the moment, focus on the transition—in the post-war world—from Keynesian policies to the era of minimum government.

It should be clarified at the outset that the economic principles now in ascendance around the world are a combination of the Hayek-ian principle of minimum government and the Milton Friedman-ian monetarist principle of money supply being so regulated as to bring about zero-inflation. These two foci essentially sum up the economic philosophy of Margaret Thatcher; and it is certainly the Friedman approach that today

informs the philosophy of the International Monetary Fund. (It is ironical that the two Bretton Woods institutions, the IMF and the World Bank, were really the brain child of John Maynard Keynes. The third institution dreamed up by Keynes—the International Trade Organisation—is now about to be reborn, with a dramatic genetic mutation, as a child of the US concept of the New International Economic Order, in the form of the World Trade Organisation, replacing the GATT. But that is another—and a long—story.)

As pointed out recently by Amit Bhaduri and Kazimierz Laski, "the dominant view of macro-economic policy prescriptions swings like a pendulum every few decades—from the view that the government is interfering too much with the economy to the view that it is not doing enough" (*vide*, Amit Bhaduri and Kazimierz Laski: *Relevahce of Michal Kalecki Today*; *EPW*, February 12, 1994, pp 356-57). It is not necessary to repeat Bhaduri and Laski's highly pertinent sentiments, expounded so recently in these columns. But perhaps an American view is worth reproducing here. "A competent, customer-driven public sector is necessary, partly to provide services—and partly to keep the private sector honest", says Robert Kuttner; and he adds "Even liberals get exasperated at dumb public sector bureaucracies—yet private bureaucracies are neither as efficient nor as self-cleansing as many of their champions insist". (*vide*, Robert Kuttner in *International Business Week*, New York, June 28, 1993, p 7).

New Right

It is interesting that it was left to a journalist, Brendan Martin* (described as "an independent consultant specialising in privatisation and public sector reform world wide"), to bring out the theoretical edifice of the neo-conservative—described by Martin as the New Right—economic policies which have gained ascendancy in industrially-developed countries since the 80s. It is Brendan Martin who brings out succinctly the nature of the neo-conservative philosophy, as a combination of the Hayek-ian doctrine of minimum government, and the Milton Friedman-ian approach to monetary policy. In some ways, this philosophy seems to have inspired both Margaret Thatcher and Ronald Reagan, though Reagan threw Milton Friedman to the winds in his quest for a new international economic order under the hegemony of the US. However, while abandoning the Friedman approach within the US, Reagan prompted the IMF and the World Bank to assiduously pursue these policies for developing countries, in regard to financing the balance of payments disequilibria—and of the capital needs of development—of hitherto underdeveloped countries around the wold. Thatcher in Britain was equally influenced by Hayek and Friedman, but it was essentially the former's dictum of 'minimum government' which inspired Thatcher's zeal for privatisation. On the other hand, western Europe has had much less enthusiasm for Hayek-ian thought; the economic philosophy of western Europe was strongly influenced by monetarism, especially after the 'stagflation' that engulfed the industrially developed countries in the 70s. And initially, the Bretton Woods twins also adopted the same philosophy. It is only lately that the privatisation bug has bitten the World Bank and the IMF.

Again, one has to reflect on the conjuncture of historical developments in the 70s. The west European countries had for years been fretting against the continuing balance of payments deficits of the US—a surfeit of dollars meeting more than the needs of liquidity of the entire world—and as early as 1971, major cracks had appeared in the Bretton Woods formula of stable gold prices and stable exchange rates monitored by the IMF. The Smithsonian agreement of 1971 was a patch-up that just could not succeed. Then, in 1973, came the first 'oil shock'; and inflation—with stagnation of output—overtook all developed countries. The era of 'stagflation' was the signal for the emergence of Friedman's monetarism.

It was the US influence—especially during the Reagan-Bush era—which ushered in a noticeable change in the approach of the World Bank, in regard to the terms of financing "structural adjustment, which became necessary for all (non oil-producing) developing countries, as a result of the sharp deterioration in their terms of trade. One has to note that during the 70s, all developing countries lacking indigenous oil reserves felt the double shock of declining commodity prices (and therefore, of declining export prices) and rising import prices. They needed balance of payments support in addition to development finance.

The 70s also saw a glut of finance availability in the form of petrodollars, and many commercial banks lent large sums of capital unwisely, especially to South American countries. These loans misfired; and in the early 80s, the problem of massive external debt—contracted at high interest rates—hit many borowing countries around the world, particularly those in Latin America.

It is curious that at this juncture, the so-called Paris Club stepped in, with the blessings of the IMF. It remains a moot point as to why the International Monetary Fund should step in to save banks in developed countries from ruin (arising from foolish and greedy loans made by them), but intervene it did. The IMF and the World Bank stepped in to lend to the indebted countries, provided they did not renege on the debt contracted by them from commercial banks. Debt-servicing and debt repayment thus became a first charge, and a condition for assistance from the IMF and the World Bank. Debt-equity swaps, all to the advantage of foolish and greedy lenders to poor countries, became the order of the day. The Milton Friedman approach informed the IMF lending conditions, while the Hayek-ian approach of "minimum government" became the credo of the World Bank, even in regard to development financing.

Turnabout

Perhaps this brief excursion into the economic developments around the world from the mid-60s may help in an understanding of the 180 degree turn in the economic philosophy of the World Bank—from the days of George Woods in the early 60s to the Lewis Preston regime currently.

The 50s and the 60s were decades of uninterrupted growth in the industrially-developed countries. They were also years when Keynesian policies of state intervention were widely accepted. More importantly, development economists around the world—in particular, the exponents of the 'big push' theory (Albert Hirschman and others)—felt strongly that state intervention was a necessary (though not a sufficient) condition for imparting an impetus for economic development to developing countries. The two decades of the 50s and the 60s during this century saw even those steeped in classical economics, in particular people like John Hicks (and a host of others) prescribe the conditions for industrial societies to grow consistent with full employment.

We are not concerned with the socialist experiment here; but there is no doubt that the Reagan-Thatcher drive in favour of private enterprise got a big boost from the collapse of the Soviet economy, and of communist regimes in eastern Europe, from 1989 onwards. The reasons for the collapse of the eastern European economies do not concern us here directly; yet, it needs to be reaffirmed categorically that it was not the inherent superiority of the market system as an allocator of resources—Keynes has demonstrated the essential inadequacies of the market system—which has been the prime cause of the cataclysmic changes observed since 1989. Rather, it was the failure of over-centralisation which led to the collapse of the command economies. The point to note is that we see increasing signs of over-centralisation of economic decision-making under the philosophy of 'minimum government'. The clout of the MNCs, of international finance

capital, has in fact led to worldwide over-centralisation of economic decision-making, even to the exclusion of otherwise strong and powerful states.

The pressure—from all international institutions—today is for privatisation. Of late, the credo of privatisation has become an ideological issue rather than one of deliberation as to the need, the circumstance, the likely gain. Indeed, what is even more dangerous is the ideology that any government intervention in economic activity is bad by definition—the South Korean experience is cleverly laid aside—and that all private enterprises are necessarily better and more efficient than their public sector counterparts. There is a logical-cum-philosophical issue that arises herein that is missed in usual debates on the subject. The exponents of 'minimum government' are strong advocates of government enforcement of law and order; and the forces of law and order are to be used for breaking up trade unions, crushing organised strikes, for liquidating workers' resistance. The focus now is on a 'flexible employment' policy. Thus, while government must not intervene directly in the domain of economic activity, it must intervene in favour of employers who should have the right to hire and fire, to close down establishments at will (and to restart them elsewhere in an environment more adapted to exploitation of workers).

There is another aspect of state intervention that is missed by the ideologues of private enterprise. The state must manage money supply so as to ensure zero inflation, no matter what the cost to society is.

Brendan Martin analyses the above, and related issues with the skill, and understanding surpassing that of most economists. In a volume spanning 17 chapters, and replete with not only logical arguments but also practical illustrations, Brendan Martin has demonstrated: (a) that privatisation of public enterprises is not necessarily in the public interest but in the interest of certain (identifiable) pressure groups and vested interests; (b) that the ideology of privatisation—coupled with other policies enforced by the IMF and the World Bank—is not in the interest of developing countries; and (c) that there is a viable alternative, which is possible to attain, by empowerment of the service users (i e, by decentralisation), by regulation and by genuine competition, by devolving management responsibility, in short by restructuring and reforming the management of public services, public utilities, public enterprises.

A few general propositions, again based on Brendan Martin's analysis, would be in order here. The first general proposition that one can make without fear of contradiction is that the capitalist system is no longer what was envisaged by Adam Smith. Free competition among a large number of buyers and sellers is no longer a part of the capitalist ideology. This is partly due to technological changes, but the process has been hastened by the emergence of transnational corporations with control over large capital and other resources, which enables them to call the tune in regard to international economic policy making. In the early 1990s there were 37,000 multinational companies (MNCs) straddling the international economy through 1,70,000 affiliates throughout the world. A mere 172 MNCs in five countries (USA, Japan, France, Germany and the UK) accounted, in 1972, for sales of $ 5,219 billion (*vide*, Brendan Martin). Although the magnitudes are not really comparable, one has to compare this volume of turnover with world GDP estimated at around $ 2,19,000 billion. Thus, the sales of 172 MNCs in five countries alone were 24 per cent of world GDP, an indication of their economic and financial clout.

Inevitably, as a result, the reformed GATT, signed on December 15, 1993 at Geneva, speaks of 'market access'. Competition is no longer the concern of the GATT. Trade as an instrument of economic development is an outmoded concept, and Chapter IV of the erstwhile GATT finds no place in the revised text. Instead, there is focus on the sanctity of Intellectual Property Rights, of trade in services (even though free movement of population is firmly denied), of freedom of capital movements (which would give international finance capital a complete grip over national economic policies).

It is in the above background that we in India need to look at the present drive—inspired by the World Bank/IMF—for privatisation of state enterprises. Indeed, the cult of privatisation has now straddled on to the realm of social services. Education, medical and related services, it is argued, are better delivered by private enterprise than by the state. Private enterprise has become, in a Hayek-ian framework, the best way to organise all economic activities because all 'government' intervention is necessarily bad.

Curiously, this extreme view is not stated by government spokesmen, but urged on the government by a section of the news media and business interests. But seminars are being organised by management institutes to 'educate' the bureaucracy on the wisdom of privatisation; and in one such seminar (attended by the present writer) official spoksmen were full of inefficiency of (a few selected) state electricity boards and of the Indian Airlines with examples of the efficiency of some private airlines to urge that all public enterprises should be privatised forthwith. (This was, of course, considerably before the neglect of maintenance—and of the flouting of 'safety norms' by some airlines came under official notice). However, in the present context, we should not get bogged down by specifics; we need a clearer understanding of the overall philosophic approach.

The absurdity of the proposition—as stated by official spokesmen—does not appear to bother the modern exponents of 'neo-conservatism'. Yet, the neo-conservative needs a government with an effective police force for maintaining the status quo. That any exchange between two parties with vastly different resource power is likely to result in unequal exchange, or unequal gains from exchange—in the matter of both internal and external exchanges—is conveniently forgotten. (Long ago, as far back as the 19th century, Alfred Marshall had demonstrated that the gains from trade are never equal: *vide*, Marshall: ***Pure Theory of Foreign Trade***.) Today's international economic policies have come to be governed by international finance capital; and all other 'players' in the arena are like puppets: even this cardinal truth does not occur to the champions of liberalisation and globalisation in India. (Just one individual speculator, George Soros, demonstrated this by successfully bringing down the pound sterling and forcing the UK to opt out of the ERM of the EEC). That 'liberalisation' ought to be directed to freeing the energies of the vast multitudes of the Indian population does not figure in the calculus, for the calculus being applied today is that of international finance capital.

Thus, we have a new 'ideology' let loose on the Indian economy, in which the 'media' have an important contribution, seeking to destroy the Indian polity, devastate the Indian social framework. And yet, the official pronouncement is that India will chart the 'middle course'. That was stated by no less an authority than the prime minister of India at Davos in early February and in London in early March of this year. The present 'middle course' is, however, the middle of nowhere. India is adrift in a turbulent sea.

Brendan Martin's incisive analysis is titled, 'In Whose Interest?' The Indian people have a right to ask: 'For Whose Benefit, In Whose Interest' are the placatory statements being made by the Indian prime minister, even as India systematically surrenders her economic sovereignty, her prize assets, her freedom to steer the country in a world of financial sharks?

Chairman's Report 1993-94

Dear Unitholder,

This year marks the completion of three decades of UTI. It is a landmark year in the existence of any institution. I take great pleasure in presenting report on the Trust's performance during its thirtieth year. It has set several landmarks. They are a reflection of your abiding trust, faith and confidence in us. UTI's investible funds crossed Rs. 50,000 crores contributed by over 3 crore and 60 lakh unit holding accounts. Unit capital of Unit Scheme '64 crossed Rs. 10,000 crores and the number of unit-holding accounts under the scheme crossed one crore. UTI's sales grew by 70 percent. Despite significant reduction in interest rates, UTI is maintaining dividend on all schemes.

All these have come in the face of some tough challenges. Last year added a new dimension to the competition with the entry of six new private sector mutual funds. Interest rates came down and the capital markets remained volatile. This made the task of maintaining the nominal rate of return to our investors difficult. Yet, the Trust has been able to give more than the promised rate under all its income plans. It needs to be stressed that this means a higher real rate of return in view of the lower rates of inflation prevailing during the year.

Sales: Though the last year witnessed step up in competitive activity with the entry of 6 new private sector Mutual Funds, UTI's market share remained unaffected with total sales exceeding Rs. 10,400 crores in face value (and Rs. 12,500 crores in sale value). This represents an increase in sales of 70% over that of last year.

During the year the Trust launched seven new schemes, apart from ongoing open-ended schemes. Roughly 67% of the funds were collected under our open-ended schemes, while 22% of the funds came from income oriented close-ended schemes and remaining 11% came through our equity-oriented schemes.

Among the schemes, there was a resurgence of investor interest in the Unit Scheme '64, with sales increasing by about Rs. 1850 crores, coming from 8 lakh investors. Sales under Children's Gift Growth Fund & CRTS-81 were also significantly higher than that of the previous year. Three monthly income schemes were launched and among them they mobilised over Rs. 1400 crores – thus sending strong signals of their continued popularity. The sales under Deferred Income Unit Plan '93 also did exceedingly well.

We are slowly moving into an era where committed rate of return for a longer period will be a thing of the past. Last year we introduced one such scheme – "Growing Corpus Growing Income Plan" – without any committed rate of return. The scheme elicited a fairly good response with over one and a half lakh investors putting in about Rs. 200 crores.

The Master Equity Plan '94 proved to be nearly the unanimous choice among investors of Equity Linked Savings Scheme. Good performance of the earlier series of Master Equity Plans seems to have reiterated investors' confidence in UTI. The scheme collected Rs. 733 crores from over 10 lakh investors.

Fund Performance: This was yet another year of commendable performance of our investment under different schemes. In a year marked by extreme volatility of the stock market one redeeming feature for the investors of UTI growth schemes was that the Net Asset Value of all UTI growth schemes continued to outperform the stock market indices. This is shown by the following table:

Growth Funds	NAV as on June 3, 1993	NAV as on June 1, 1994	Appreciation (%)
UGS 2000	19.61	36.77	87.51
UGS 5000	15.08	28.48	88.86
Masterplus	13.03	24.55	88.41
Mastergain 1991	178.75	333.57	86.61
Mastergain 1992	9.50	16.81	76.95
MEP 1991	18.67	34.82	86.50
MEP 1992	10.28	18.91	83.95
MEP 1993*	10.31	17.86	73.23
US 1992	9.84	17.41	76.93
Mastergrowth	10.21	18.64	82.57
Grandmaster	–	19.14	–
BSE Sensitive Index	2,253.4	3,833.5	70.12
BSE National Index	1,045.8	1,841.3	76.07

** NAV of MEP-93 is as on 30-06-93*

Mastershare, the first equity oriented scheme of the Trust, which was offered for redemption at NAV based repurchase price has given a compounded annual return of 46.36% to the investors. However a majority of the investors who decided to continue with the scheme were given a post redemption dividend of 18% in addition to bonus units in the ratio of 1:3 and rights in the ratio of 1:1 on the enlarged capital.

Investors of our income schemes which matured last year were also pleasantly surprised with capital appreciation on maturity, which were much more than promised e.g. the

capital appreciation on maturity declared under MISG(11) was 11% as against 2% promised and it was 28% against a similar promise of 2% under MISG(12). Under DIUS'91 a bonus dividend of 7% was declared though there was no such promise.

Investor Services: For a financial organisation like ours efficient fund management itself is an important element of service. However, with the increase in the volume of work, services came under stress and UTI and its Registrars have not been able to cope up with the increasing activities. UTI has been making sustained efforts to improve investor satisfaction in areas of after sales services.

- A fully owned UTI subsidiary christened "UTI Investor Services Ltd." started functioning as Registrar and Transfer agency. Gradually this should reduce our dependence on outside registrars and enhance our servicing capacity.
- As a result of the technology upgradation project under implementation, facility to issue certificate 'Across the Counter' for Unit Scheme '64 was extended to 21 places. In Bombay this facility has been extended to CGGF also.
- A single window investor services cell has started functioning at Bombay responding to investor queries from anywhere in the country.
- In order to protect the investors' interest, the Trust started buying back units from the stock market when the market prices fell by more than 10% over the NAV of a listed scheme.
- The maturity proceeds of our income schemes were distributed to the investors without calling for their membership certificates. This saves a lot of time and results in prompt receipt of maturity proceeds by the investors.

Social Audit: To address the question as to what extent this unique organisation has been able to fulfil its responsibilities vis-a-vis its various publics and the society at large – an independent Social Audit Committee of five eminent citizens has been set up. The Committee has decided on its own methodology and has been working for the last six months. It has also commissioned the services of a professional market research body to survey and solicit the views and suggestions from various UTI constituents. The committee is expected to submit its report by the end of September, 1994.

HIGHLIGHTS

Sales
- Total sales exceed Rs. 12,500 crore (Rs. 10,408 crore in face value)
- 8 million fresh unit-holding accounts added

Size
- Investible funds cross Rs. 50,000 crore mark
- Total number of Unit-holding accounts cross 36 million

Dividends
- Unit '64 – 26.0%
- ULIP – 16.5%
- CRTS – 18.0%
- CGS – 11.0%
- Mastershare – 20.0%
- CGGF – 14.0% (+ 3% Bonus Dividend)

Bonus & Rights Offers
- 1:4 bonus and 1:1 rights on enlarged capital under UGS 2000
- 1:5 rights under US '64 declared at 20% discount over the sale price for the month of September '94

Investment Performance
- All growth Funds outperformed the Stockmarket Indices
- Income Plans provide more than the promised returns

Diversification
- UTI Bank, the first private sector bank, inaugurated on April 2, 1994
- UTI Investor Services Limited becomes operational

UTI to be monitored by SEBI: UTI has been scrupulously following the various provisions and regulations contained in UTI Act, 1963 and UTI General Regulations. In keeping with the changes in the regulatory framework, SEBI has been asked to supervise UTI, consistent with the UTI Act. This would become effective from July, 1994.

Outlook: As a part of our efforts to bring services closer to the investors, we plan to open atleast five new branches in the coming year. That apart, our collection network will be widened further with our Chief representatives acting as our collection agents at more number of places. The technology upgradation project which has already started showing results in some areas of our operations, is likely to make a sea change in our investor services in about a years' time.

Marketing UTI's financial schemes, managing investors' funds and providing after sales services of the large dimensions that UTI have – 3.6 crore unit-holders – involve large scale support and service of various agencies. Any weak link could lower the quality of overall service. Financial services are highly intricate, highly inter-dependent and require promptness and timeliness of the highest degree from all concerned. An Institution of closely related Affiliates which can provide diverse services can create tremendous synergy, and from customers' point of view, render services which have the mark of the Institution's character and commitment. UTI is in a position to meet various needs of its unit-holders as well as industry clients by creation of such Affiliates. In the era of liberalisation, this is expected from UTI and UTI shall not be lacking in response.

Acknowledgements

I would like to express my gratitude and pay tribute to the dedication, sincerity and hard work put in by all my colleagues and other constituents of the Trust who have made these achievements possible.

Yours sincerely,

S. A Dave

S.A. Dave

For your better tomorrow

Nationalising Aesthetics

Janaki Nair

The Making of a New 'Indian' Art: Artists, Aesthetics and Nationalism in Bengal, 1850-1920 by Tapati Guha-Thakurta; Cambridge University Press, Cambridge, 1992: pp xxvii + 351.

FOR long, historians focused on the economic, social and political aspects of colonialism and the national movement in modern Indian history. More recent perspectives in history, such as the feminist perspective, have reaped rich harvests from cultural history, drawing liberally on the literary and performative art traditions. Although social history has drawn a great deal of sustenance from myth, oral culture and vernacular literatures, there has been a significant silence about the visual arts. Rarely have the visual arts of the colonial period been tapped as an archive; even more rarely have they been considered a way of reconstructing historical epochs.

If the visual artists and their historians inhabit altogether different institutional spaces with little or no contact between history and art history today it is partly an expression of the general indifference, even hostility, to the training in visual languages in India. Yet it is today more than ever that historians need to remain alert to the fact that such indifference is a luxury. In such contentious times as these, the world of visual representation has become a major site of struggle: the recent use by the Allahabad High Court of Nandalal Bose's illustrations of the Indian Constitution to decide on the historicity of Rama is a case in point. In this sense, Tapati Guha Thakurta's book is doubly welcome: it enhances our understanding of the process of nationalist hegemony while emphasising the significance, and limits, of studying the development of a new aesthetic.

Like every other sphere of Indian life, Indian visual art forms underwent a radical transformation in the colonial period. To some extent this was a result of the introduction of new materials (such as the use of oil paints) and the influence of western representational modes (such as realism). But to a large extent, the changes were directly a result of the extraordinary implications of shifts in patronage. The decline of temple and court as patrons of the arts, and the development of new individualised sources of patronage, i e, the development of a market in art, meant that the 'meaning' of a work of art was increasingly produced not solely by the artist but also by a new mediator, namely, the critic. The hieratic qualities of artistic production changed dramatically, but the critic and the colonial patron became the arbiters of taste, the retailers of the new aesthetic, determining to a large extent the nature of artistic production.

No wonder then that the question of patronage is a central concern of the book. Guha Thakurta is concerned mainly to mark the ways in which a new nationalist aesthetic was able to establish its hegemony, but the measure of such success was in many ways commercial. Concerned as the emerging Indian bourgeoisie was for the art work as 'value' (or investment) as well as 'decoration', a space had to be cleared for valuing 'creativity', as opposed to mere imitation. The artistic sensibility then had to be reified as 'genius'. Nationalist art had to set itself off from the 'lowly' artisanal qualities of the bat-tala woodcut or the Kalighat patua or the mass produced oleograph, even as it could be no mere replication of the western notion of individuated genius. Setting off high art from low, and eastern sensibilities from the western, both in terms of the form and format of art work, was the nationalist agenda. In distinguishing itself from both these kinds of art in colonial India, the artistic production could be sacralised in a new sense, by serving the cause of the nation, in an idiom which was overwhelmingly Hindu: in the process, new nationalist iconography was hypostasised in a way that also isolated it from history.

Endowing nationalist art with such superior purpose was by no means accomplished by the artist alone: equally involved was the indigenous art critic, the western orientalist and, of course, the new patrons. The process by which such a distinction was achieved and maintained in Bengal between 1850 and 1920, especially as represented by the work of Abanindranath Tagore, is the book's central concern.

The first three chapters lay out the kinds of dislocation in the world of art that were produced by the introduction of colonial rule in India. In the early stages of colonial rule, one group of painters found a source of livelihood in company commissions for paintings of types and trades (p 18), while a strong market flourished for patuas, rural scroll paintings which were transformed in the city both in form, through the use of watercolours, and in format, through irreverent portrayals of new social classes and their moralities. But the introduction of printing technology soon produced a breed of wood and metal engravers, who cornered a larger share of the market through an adaptation of their skills to facilitate reproduction (pp 18-35). The bat-tala engravings were linear, stylised and two-dimensional, though thematically similar to the Kalighat pats.

A third set of painters, who remained somewhat more anonymous, were those who adapted certain realist conventions to the production of mythological pictures for the mass market in oils. Little is known of the sources of inspiration of these artists but it is clear that there were shifts in the demands of the local elite for realistic renderings of religious figures which retained their divinity despite the demands of naturalism (p 43).

Meanwhile, the introduction of capitalist relations in land and the concomitant rise in forms of consumption which spoke of the status, style, and culture of the owner, produced a demand for the framed oil paintings and busts which were directly modelled on European-style paintings (pp 54-55). This taste for European-style paintings was clearly no accident, and reflected the growing emphasis put on western art by colonial administrators, especially in the art schools which were set up to train Indian artists in western academic styles. The emphasis on such training went alongside a concern for the preservation of the arts and crafts of India which were considered extremely precious skills, but the higher ground was still held by the western artists whose sense of perspective and flair for naturalism was considered far more well-developed.

The emergence of the gentleman artist in the milieu of the art schools, distanced by social background and training from the artisans, accompanied a shift in the self-conception of the artist who acquired a new respectability. Such dignity was possible because artists managed to find financial succour from teaching, and the very respectable profession of book illustration (p 83). Here too, the patronage of the wealthy families of Bengal was significant, and it was the aesthetic demands of this class which forced artists to work out a new iconographic imagery. There was an increasingly close linkage emerging between the visualisation of "Avatars Ragas and Raginis", namely, Hindu faith, as the source of "art" (pp 89, 139).

In no small part, such a reading of what should be the proper source of inspiration for a truly national 'art' was greatly enabled by the work of prominent orientalists, notably, E B Havell and Ananda Coomaraswamy and the pan-Asian ideas of Kakuzo Okakura and Sister Nivedita. Guha Thakurta suggests that theirs was an attempt to recover the splendours of truly great religious (read Hindu) art which had been in decline for centuries, at least in part due to the secular nature of Mughal art. This essentialising of Indian art history, based on the 'discoveries' of Ajanta and of rajput painting, paralleled the more general essentialisation of Indian history which was well under way, and indeed had succeeded in enthroning the aryan myth and vedic ideals as quintessentially Indian.

Yet even here, only certain forms of representation of mythical heroes were admitted

to what would become a truly national art. The work of Raja Ravi Varma, which had been popularised through reproduction, was considered the epitome of 'bhava' in the late 19th century, and from which criticism had been consciously withheld since that was considered premature, was now denigrated as vulgar, sensuous and grossly 'un-Indian' (pp 186-87). National Indian art was invested with a new morality and an intense spirituality which made it commensurate with political and economic swadeshi.

The person whose work epitomises the 'moment of arrival' in new nationalist art was Abanindranath Tagore. Tagore was acclaimed as the true nationalist artist by orientalist and nationalist critics alike, and his work defined the start of a new school of Indian painting. Despite its advances, this exploration of Indianness congealed into a formula. An occasional critic like Benoy Sarkar attempted to forge anew the language of art criticism, concerning himself with "a general language of form" and remaining critical of the slavish state to which Indian art had fallen in its anxiety to serve the cause of the Indian nation. There was a recognition therefore that local sources of inspiration and an intensity of feeling were critical to the development of the new aesthetic, but that could not be at the expense of formal excellence which deployed the universal language of art.

Despite the efforts of the likes of Benoy Sarkar, Guha Thakurta argues that by 1922 the 'nationalist' was the dominant aesthetic. The claims to 'Indianness' of the Bengali artists were secured by the fact that Abanindranath's students fanned out across the country to head art schools that were then being established (p 311).

The development of an Indian-style aesthetic which drew on the traditions of Ajanta, the rajput or the Mughal miniature, remained entirely within the terms set by the orientalists especially in its early stages: it is in this sense that Abanindranath's work functioned as an acceptable form of cultural nationalism, perhaps the least threatening of its forms, receiving, and thriving on, official support of the material as well as ideological kind (pp 278, 279). But Guha Thakurta does not quite draw out the implications of Abanindranath's repudiation of swadeshi politics and his "conscious distancing from the sphere of political activism" (p 259), especially as it translated into official support by his school of nationalist art. The impossibility of 'realism' (not as a set of formal techniques but as a way of engaging with the materialities of colonial rule) for artists such as Abanindranath, rooted as they were in the privileges that were engendered by colonialism, meant that the visual arts at that time could never pose the same kind of threat that plays and novels could, and did, pose (and were therefore proscribed).

A far more robust critique of colonial society did, on the other hand, exist in the pats and woodcuts of the artisans, despite their formal technical, limitations. Such critiques were increasingly elbowed out by the much vaster possibilities of mechanical reproduction but, more important, lacked the ideological support enjoyed by the culturally obedient "new nationalist" art.

Since the nationalist aesthetic evolved in ways that idealised the Hindu mythological tradition, remaining "exclusive" rather than "inclusive" in its scope, what also appears to have been elbowed out were the Muslim artisanal traditions. Indeed, apart from mention of Abdur Rahman Chugtai, who belonged to a family of Persian sculptors and painters but was quite thoroughly absorbed in the Abanindranath school of national art, it is not quite clear from this account whether there were Muslim painters. Were their sensibilities the same as the 'nationalist' ones? How did the nationalist hegemony process work in this case (as opposed to the 'high' vs "low' distinction which is more fully explored throughout this book)?

Finally, there is the very crucial question of the centrality of the figure of the woman, both in the earlier critiques of the bat-tala prints and in the sanitised and idealised images of the nationalists. Guha-Thakurta is scrupulously attentive to the refiguring of the woman in the nationalist imagination throughout her work; such attention is even unavoidable (esp pp 299-301). Even so, the process by which women became the ground on which questions of Indian tradition were debated and contested must deploy patriarchy as a category of analysis, for what was at stake in such refiguring was not just nationalism, but nationalist patriarchy.

Women themselves appear to have been entirely absent from the circle of patrons, critics, students and artists. Or were they? Certainly the painstaking searches in vernacular literatures have yielded an embarrassment of riches, and have decisively transformed the very questions that have been asked of social reform or nationalist hegemony. What role did women play in the ateliers of the Tagores, especially when they were refused the western role of 'model' or 'muse'? What kinds of intercourse were there between the artistic worlds of women and the emerging nationalist iconography, especially as the former exceeded the demands of nationalist patriarchy? Such questions necessarily go beyond a search for 'evidence' and require the reconceptualisation of the categories of art history itself. The ways in which some categories of society were excluded from artistic production, through gendered notions of 'genius', through gendered access to patronage and training, equally forms a part of the narrative of the development of a new Indian aesthetic.

In large part, Guha Thakurta's book confirms for the world of the visual arts what has already become a familiar framework for modern Indian history, namely, the 'successes' of nationalist cultural hegemony. Despite her overall commitment to questioning the boundaries of 'high' and 'low' cultures, between 'modernity' and 'tradition' (and the resultant excessive use of qualifying inverted commas), the structure of the narrative is determined by the tracking of this nationalist cultural hegemony. Nevertheless, this book is crucial not only for an understanding of the development of an Indian aesthetic, but for all social historians of modern India, illuminating as it does a neglected field of history. Accompanied by reasonably good reproductions of nearly all the genres of art of this period as are discussed, the book itself is a valuable archive, and testimony to the painstaking research of the author.

Towards Revival of Small Water Bodies

K Sivasubramaniyan

User-Friendly Irrigation Designs by Nirmal Sengupta; Sage Publications, New Delhi, 1993; pp 147, Rs 185.

THE relative significance of traditional minor irrigation sources for agricultural development in India is well known. Generally, rainfall occurs for three to four monsoon months in a year. Irrigation tanks, ponds and other micro water-sheds, known as 'small water bodies', store the run-off water and provide assured water supply throughout the year. Even from the earliest times people realised the importance of minor irrigation sources. The level of prosperity of a village directly depends upon the availability of water in minor irrigation sources. Further, 'small water bodies' contribute to ecological balance and provide water supply for rural and urban population.

The book under review examines the importance and suitability of traditional irrigation practices in Indian agriculture. In the preface, the author discusses the terms 'modern' irrigation systems and 'traditional' irrigation systems as understood by modern engineers and development experts. The study attempts to scientifically document the variety of traditional irrigation techniques practised in the country. The documentation of irrigation techniques has been done for the entire country up to the district level. The book also critically examines the quality and limitations of irrigation statistics collected and compiled by government departments.

The 'diversions' of watercourses which impede natural drainage streams are discussed in chapter 2. Based on the topography of regions, the author discusses four types of diversions: (i) diversion in steeper hill areas; (ii) diversion in sloping plains; (iii) diversion with lifts; and (iv) diversions of special types. The need for undertaking different types of storage works has been analysed in chapter 3. The techniques adopted and the procedures followed for the construction of storage-works have been described in detail. While examining the statistics provided by government departments on storage works, the author raises doubts about their authenticity and indicates important gaps between the available statistics and the realities on the ground. For instance, the data on areas irrigated by 'tanks' and the number of existing tanks in the specified category present a serious limitation which hinders inter-state comparisons. Even within a state, the given statistics on hectarage served by tanks are not reliable. In Orissa, for example, data indicate that 'tanks' serve a substantial hectarage but nothing serve 'other sources'. The author argues that it is not possible to estimate the hectarage served by 'tanks' in a partially hilly and forest state like Orissa. After providing a general account of variations in the design, size and shapes of tanks, the author estimates the overall area irrigated by tanks in the country at 25 million hectares. This estimate includes the command area of 3.6 million hectares, the submergence or water-spread area of 3.8 million hectares and the catchment area of 18.0 million hectares.

For understanding the integrated structural characteristics of design and functioning of minor irrigation systems, the author emphasises the need for appreciation of their secondary irrigational benefits. He specifies three types of conjunctive designs: (i) ground water appropriation; (ii) several small storages [illegible] provide supply of water for both drinking as well as irrigation; and (iii) diversion and storage in combination such as the 'system tanks' of south India. Among the three designs, ground water appropriation constitutes the major source of supply when the tanks dry up. The study observes, "in years when the tank is only about half full, 30 to 40 per cent of irrigation water comes from wells". The extent of rechargeability of wells through the small irrigation sources is considered more important because it is estimated by the public works department of Tamil Nadu that "about 80 per cent of wells are recharged from tanks and only the remainder are from canals and watercourses" (p 58). Thus the study emphasises the need for checking soil erosion and degradation of small irrigation designs. It is estimated that in India nearly half of the total geographical area is subject to soil erosion, of which around 85 per cent of the run-off and soil losses can be averted through integrated development of micro water-sheds.

In addition to the discussion of secondary benefits of tanks, the author also analyses the benefits that could be derived from the practices of indigenous irrigation methods and from the methods of flood control. He points out that greater economy and efficiency in water use could be achieved by using sprinkler and drip irrigation methods which ensure 'optimal spreading' of water. The management and use of minor irrigation systems by involving beneficiaries are clearly spelt out in chapter 6. The performance of maintenance work is the base for intensive development of minor irrigation system. In this context, a historical note starting from the early 19th century on maintenance of tanks, namely, 'kudimaramath' has been given. Generally, tanks with less than 40 hectares of command area are managed by beneficiaries of the tanks. However, the divisions of management responsibility is not uniform across the states. The author rightly observes: "India has had no success, as yet, in managing a nominally effective promotional policy for users' participation" (p 79).

For enhancing crop productivity the author recommends introduction of auxiliary storages (farm service reservoirs) from the modern canal irrigation projects which could be controlled by users themselves. Several examples of effective management of minor irrigation systems in which farmers themselves control and regulate the systems have been discussed. In this context, the author emphasises the need for providing support measures to upgrade the performance of tanks. The co-operation of farmers as in traditional irrigation systems could be adapted in the modern irrigation systems also. If the right kind of encouragement is given, even the unscrupulous self-seekers might want to enter the co-operative management. Failures in irrigation management were observed mainly due to the ill-conceived promotional policies.

In chapter 7 the reasons for deterioration of 'small water bodies' have been indicated. In the post-independence period, especially after the introduction of massive rural electrification programme for exploiting ground water, the deterioration process became more evident. Through the analysis of Time Series Land Use Statistics (1950-51 to 1987-88), the author has shown that "user-friendly systems have suffered a rapid rate of extinction since the 1960s". The 'discriminatory approach' followed in irrigation development resulted in the rapid growth of areas irrigated by government canals and ground water sources. The main factors responsible for deterioration of minor irrigation sources are the ineffective government policies and programmes, extensive encroachments in the catchment areas, existing property rights systems, lack

of finaňcial support, ill-designed modernisation programmes, development of pumping technology and the deterioration of co-operative spirit among beneficiaries.

An analysis of extension possibilities of 'small water bodies' has been attempted in chapter 8 taking into account the water availability, current irrigation development strategy of government and the irrigation potential of alternative strategies. While analysing the Central Water Commission's estimates of total water availability in the country the author rightly suggests the exclusion of traditional irrigation systems from the gross accounting procedure. This is mainly due to difficulties arising from the estimation of "the quantum of potential withdrawal through numerous minor farmer-managed surface-water systems". The author also examines the economics of modern irrigation systems and indicates that the large-scale modern systems have become increasingly less attractive as the ultimate potential of these systems has already been reached.

The right units for water resource planning in minor irrigation systems are the catchment and storage areas. The author discusses the significance of these units and argues for their proper development. In a region where rainfall is moderate or high, the available barren and uncultivable lands could be used as catchment and storage areas of the irrigation systems. Two important possibilities for developing minor irrigation systems have been indicated. They are: (i) proper improvement of traditional irrigation systems; and (ii) making the modern irrigation systems more user-friendly.

In the final chapter, through benefit-cost analysis the author examines the economic viability of a few tank irrigation systems located in some Indian states. Tank irrigation is an attractive economic proposition to farmers because it is estimated that the average net returns from tank irrigated hectarage in terms of foodgrains is about three times higher than those from the unirrigated hectarage. The author has also provided some examples from Andhra Pradesh and Karnataka to show the unfavourable benefit-cost ratios of tanks. He observes "As one moves to drier and more hostile terrains the cost-benefit results of these projects become increasingly unfavourable."

The irrigation projects constructed in the past were located in more favourable sites and therefore they were economically more viable. The study shows that in some cases the recovery of irrigation charges do not even meet the maintenance costs of the irrigation systems and in some states does not even cover the expenses incurred in the process of revenue collection. The study also recognises the desirability of tanks from the welfare point of view because they promote the development of backward areas. In this context, the author refers to the Philippines experience where "economic rationalisation has radically alteredthe structure of their irrigation department, whereupon greater stress is now laid on management of farmers' participation" (p 123). Finally, the author provides important suggestions for the improvement of calculations of benefit-cost analysis relating to tank irrigation projects. The study also emphasises the need for making the 'modern' irrigation systems into more user-friendly irrigation designs.

In the appendix, the author has provided some sketches of historical descriptions of early traditional irrigation systems as practised in the Indian subcontinent. The author also examines the evolution of technology of construction which started around the sixth century AD. Many big tanks were built from the 10th century. Technological innovations such as stone structure of cistern sluices, the transbasin canal to transport irrigation water, the linkages between large-scale storage tanks and small farm ponds, the excellent civil engineering devices and the level-crossing canals have contributed to a major breakthrough in the development of tank irrigation system in India.

All over the world, governments have realised the need for preserving their traditional irrigation systems which serve as useful guide to the construction of modern irrigation systems. Preservation and enhancement of the potential of renewable irrigation resources are the desperate needs of the hour.

A major limitation of the book is that it does not have a separate chapter of policy recommendations although the author has provided these recommendations at different places. In spite of these limitations, there are very few studies on small irrigation systems in India and therefore the book on the subject is useful to researchers, policy-makers and civil engineers involved in the development of minor irrigation systems in the country.

Levelling Up or Levelling Down?

Labour Institutions and Economic Development in India

K P Kannan

This article attempts to formulate and examine two hypotheses: (i) the presence of modern labour institutions as trade unions and protective legislation is not incompatible with the objectives of economic growth and efficiency, and (ii) the presence of such traditional labour institutions as caste- and gender-based segmentation of the labour markets is supportive of neither growth nor distribution and constitutes itself as a formidable constraint in the process of economic development. On the basis of empirical evidence implications for labour policy are discussed.

I
Introduction

DESPITE the assumptions of textbook neoclassical theory, the labour market has by now been recognised as the least homogeneous and perfect of all markets. The dominant characteristic of labour markets is its segmentation [see, e g, Loveridge and Mok 1979]. But the discovery of labour market segmentation is not recent and goes back to John Stuart Mill (1848), who emphasised such non-labour market institutions as class stratification as a deeply-rooted barrier to mobility and as a source of intergenerational transmission of poverty, and his follower John Cairness (1874), who called such groups as 'non-competing groups'. However, their theories on the segmenting characteristics of labour markets were not pursued until recent times.

However, the current interest in labour institutions emanated not from the perspective of labour market segmentation but from a broader concern with linking labour institutions with the pace and pattern of economic growth and distribution [see, e g, Rodgers 1991, Freeman 1992a and 1992b]. The recent and spectacular experience in achieving high rates of economic growth in east Asian countries has been a major source for the revival of interest in understanding the role of institutions, especially labour institutions, in economic development. In particular, the relative weakness of trade unions as a major labour institution on the one hand, and the absence, or low profile, of protective labour legislation on the other, have been sought to be contrasted with their legally and socially influential presence in the advanced capitalist economies of the west especially in western Europe.

The classical view on the segmenting influence of labour markets, referred to earlier, may be called the traditional labour institutions (e g, caste, attitude to women's work and its remuneration) whereas the presence of trade unions and protective labour legislation (e g, minimum wages, non-wage benefits, job security, etc) may be called the modern labour institutions. Both these are actively present in the case of India. The former, especially caste (or community in certain regions),[1] and gender-based labour market segmentation, is pervasive across rural and urban labour markets both in the organised and unorganised sectors of the economy. The latter however is confined, by and large, to the organised sector. Both these have become the subject of much public debate and controversy. As we shall show later, the presence of trade unions and protective labour legislation has been characterised as inhibitive of employment, growth and efficiency especially in the context of economic liberalisation and the consequent integration of the economy with the global capitalist economy. As for traditional labour institutions, social and political struggles for affirmative action in the labour market in favour of the socially disadvantaged groups (mainly based on caste identity) have gained momentum but these have been opposed in the name of efficiency and growth.

Our attempt here is to question both the arguments, based on empirical evidence, and formulate the following hypotheses: (i) the presence of such modern labour institutions as trade unions and protective labour legislation is not incompatible with the objectives of economic growth and efficiency, and (ii) the presence of such traditional labour institutions as caste- and gender-based segmentation of the labour markets is supportive of neither growth nor distribution and constitutes itself as a formidable constraint in the process of economic development.

Given this perspective,[2] we view the presence of trade unions and protective labour legislation in a positive light and argue for creating conditions for their presence in the unorganised sector. In a similar vein, we argue for an active affirmative action policy not merely confined to the labour market but also outside of the labour market to ameliorate the pre-entry (to the labour market) barriers of the socially disadvantaged groups. Both these are examined from a growth point of view especially one that would contribute to an increase in effective demand through broadening the sources of growth.

II
Do Unions and Protective Labour Legislation Inhibit Growth and Efficiency?

Since the early 80s when economic growth began to slow down in the advanced capitalist countries, one of the first labour institutions that came under attack were trade union, and protective labour legislation. It was argued that these two institutions do not provide the flexibility required for employers to restructure the industry with a view to cut labour costs and make it more competitive. Retrenchment becomes difficult, technological changes are resisted and these affect adversely on productivity and growth. There are strong and influential adherents to these views with respect to India [e g, Lucas 1988; Fallon and Lucas 1989; World Bank 1989; and Ahluwalia 1991]. Their arguments can be summarised as follows: The organised (mainly manufacturing) sector in India is characterised by the presence of strong unions and protective labour legislation aimed at increasing real wages (as well as non-wage earnings) and job security. These have constituted themselves as a major labour market distortion leading to substitution of capital for labour and hence increased effective cost of labour, excess of labour due to past overmanning and stringent exit policies, increased real earnings resulting in a decline in the growth in employment and, implicitly, the efficient use of manpower. Taken

together, these views constitute a strong indictment on the two most important modern labour institutions (unions and protective labour legislation) *vis-a-vis* their role in economic development especially in relation to employment and labour efficiency.[2]

While the fact that growth in employment in the organised sector has declined since the beginning of the 80s has been recognised, the causal factors have not been established unambiguously. The argument that the decline is due to, among other labour market 'distortions', an increase in real wage rate as put forward by Lucas (1988), Fallon and Lucas (1989), and Ahluwalia (1991) has now been disputed. A recent study has shown that "while earnings per worker in registered manufacturing increased at 3.2 per cent in the decade beginning 1979-80, earnings per manday increased at only 1.6 per cent per annum which is less than the corresponding per capita GDP growth rate during the same period (2.7 per cent) [Nagaraj 1994: 178]. This is because workers have evidently worked a larger number of mandays in the 80s compared to the 70s.

The above finding is quite revealing in the light of the claim of rising real wages as measured by earnings per worker. However, a rising real wage *per se* does not say anything about labour efficiency unless it is related to labour productivity. If it is argued that "unions, aided and abetted by the state, have raised wages ahead of productivity" [Lucas 1986 and Sengupta 1988 as reported in Deshpande 1992], then it could be argued that it is a problem arising out of labour institutions because it goes against considerations of dynamic efficiency. However, this will be crucially dependent on whether the initial share of wages is perceived as socially acceptable (depending on how far it deviates from the average share of wages in the economy). Without going into the acceptability or otherwise of the initial distribution, we examine the aspect of dynamic efficiency in the organised industrial sector characterised by the presence of unions and protective labour legislation.

From the point of labour institutions, the concept of dynamic efficiency takes into account both the growth and distribution objectives of economic development. Employers are concerned with the share of wages in value added because that determines the share of profits. From a dynamic point of view, what needs to be tested is the growth in per capita labour productivity and the growth in product wage representing the share of wages in value added. Deflating the current values of both by the wholesale price index for manufacturing, we have arrived at their real values for the organised sector as represented by the factory sector in the Annual Survey of Industries.[3] Three possible outcomes and their implications may be stated as follows:

(a) If the difference between the growth in labour productivity (LP) and growth in product wage (W_w) is positive, then the industry concerned is efficient in the dynamic sense (enhancing efficiency while increasing the wage rate) and that the presence of unions and protective labour legislation is not incompatible with the objectives of growth and distribution. In such a situation, conditions are favourable for accelerating accumulation.

(b) If the difference between LP and W_w is zero, then the existing level of efficiency is maintained and the industry concerned could continue with the current rate of accumulation. In this case, the presence of unions and protective labour legislation is neutral and preserves the status quo.

(c) If the difference between LP and W_w is negative, then the industry concerned is not dynamically efficient and hence likely to experience a decline in its ability to compete. In such a situation, the presence of unions and protective labour legislation may be said to be not compatible with the objective of growth. But this calls for an important qualification. As we noted earlier, if the initial distribution in terms of the share of wages is perceived to be unacceptable, then the presence of unions and protective labour legislation could be viewed as a corrective force.

We report here two sets of results. Table 1 presents the results for the factory sector as a whole. And this includes both large and relatively small enterprises in the organised sector. The results are quite revealing. For the organised sector as a whole, there is no evidence to show that the presence of unions and protective labour legislation has affected the dynamic efficiency and thereby the objectives of growth and distribution. Growth in product wage has been more than compensated by the growth in labour productivity. And since the difference is positive, the objective of accumulation and further growth has been served. Other things remaining the same, higher the difference the greater is the scope for accumulation and growth. A periodwise examination shows that the difference has been highest since the 70s although there has been a decline during the 80s. This is possibly the basis for the concern about the role of unions and protective labour legislation in the organised sector in the 80s.

The reported decline in total factor productivity should therefore be attributed to factors other than labour especially on such factors as capacity utilisation and supply bottlenecks. It is important to note here that, while giving these as possible reasons, Chakravarty (1989:57) has also underlined the slow growth of domestic absorptive capacity for many of the consumer durables. And this is linked to the question of expanding effective demand in the economy, an important source of which arises out of the income of labour.

There could be variations in dynamic efficiency at the level of individual industries. We have results for 18 industry groups that constitute the manufacturing sector in India within the organised sector. Table 2 gives the results. During the period 1973-74 to 1985-86, for which we have been able to obtain the data, the condition for dynamic efficiency has been satisfied by 15 out of the 18 industry groups. The three industry groups, which showed a negative difference in dynamic efficiency, viz, cotton, jute and paper, are the ones which have been lagging behind in terms of modernisation of plant and equipment. We also examined the results for the period in the 80s, 1980-81 to 1985-86, to find out whether the 80s offer a different picture. It is here that we see a pattern which could be characterised as a process of polarisation in competitiveness. Forty per cent of the industry groups (i e, 7 out of the 18) show a negative difference indicating a decline in share of profit and a consequent increase in the share of wages. However, the remaining 60 per cent of the industries (i e, 11 out of the 18) show that dynamic efficiency is maintained, that is to say, the per capita labour productivity has been increasing faster than the per capita product wage. The situation here is one of increasing product wage but decreasing

Table 1. Average Annual Growth Rate in Labour Productivity and Real Wages in India, Factory Sector, 1960-61 to 1987-88

Period	LP	W_w	W	LP - W_w
1960-61/71-72	2.80	2 29	2.01	+0 51
1973-74/87-88	4.08	3.24	2.26	+0 84
1980-81/87-88	5.22	4.90	3.02	+0 32
1960-61/87-88	3.44	2.77	2 14	+0 67

Notes: LP = Average annual growth rate in labour productivity, measured in terms of gross value added per employee deflated by wholesale price index for the manufacturing sector.
W_w = Average annual growth rate in product wage measured by earnings per employee deflated by WPI.
W_c = Average annual growth rate in consumption wage measured by earnings per employee deflated by consumer price index for Industrial workers.
Source of data: Compiled from *Annual Survey of Industries*

share of wages. The situation in these industries could be one of increasing capital labour ratios. Of further interest here is that nine industries (i e, 50 per cent of the total) show a higher rate of growth in dynamic efficiency during the 80s (1980-86) than for the period as a whole (1973-86).

The picture that emerges during the 80s is therefore a mixed one. The fact that a majority of the industries are increasing their competitiveness goes to show that the presence of unions and protective labour legislation is not incompatible with the objectives of growth and accumulation. There may be a number of factors why in some of the industries the dynamic efficiency is on the negative side. Those that have lost the dynamic efficiency include the ones (cotton and jute) lagging behind in modernisation and those that may be said to be facing shortage of raw materials arising out of the scarcity of such resources as wood Capacity utilisation in these industries could have come in the way of increasing labour productivity. That the picture emerging in the 80s is a mixed one does not need any emphasis but the pattern in terms of 'high performers' and 'low performers' suggests that the presence of unions and protective labour legislation cannot be held responsible, *prima facie*, for the results is evident. Moreover, the longer term trend is certainly one which does not support any argument against the presence of unions and protective labour legislation on the efficiency of industries. Only 17 per cent (i e, 3 out of the 18) of the industries show a negative sign in dynamic efficiency for the period 1973-86.

We have also presented, in Tables 1 and 2, the growth in consumption wage, i e, current earnings per employee deflated by the Consumer Price Index for Industrial Workers. It is important to note that the growth in consumption wage (which represents the real earnings of workers) is uniformly lower than the growth in product wage. That is to say, the relative prices of wage goods (mainly food) are higher than the goods produced by the workers in the industries. This points to a more basic constraint in industrialisation, i e, the ability to increase the real consumption of workers along with their increase in productivity. The point is that wage as a cost element is increasing faster than as one representing income.

Our hypothesis therefore is that the presence of modern labour institutions such as unions and protective labour legislation is not incompatible with the objectives of growth and distribution. On the contrary, there is enough evidence to show that faster growth in dynamic efficiency is achievable, given the presence of other favourable conditions. The onus for the decline in dynamic efficiency in some industries should therefore be sought in factors such as lack of modernisation and supply bottlenecks. If the viewpoint against the presence of unions and protective labour legislation is gaining currency, voiced loudly and repeatedly by employers and their organisations, the explanation for that cannot be based on considerations of efficiency. From an institutionalist point of view as represented by the Regulationist School, the reasons are more likely to be based on the concern for control of labour so that it becomes flexible enough to suit the changing strategies of employers.

From an analytical point, the link between considerations of dynamic efficiency and growth on the one hand and distribution on the other are clear enough. Increasing labour productivity faster than earnings could contribute to investment and growth. Increases in real earnings lead to increases in effective demand from a broader base of the population (workers and their families) and give rise to a demand regime conducive to growth. Those who advocate a 'flexible' labour market without intervention emphasise only one dimension of wages, i e, wage as a cost element. Implicit (often stated explicitly) in their argument is that the market wages are higher than they ought to be and hence act as a disincentive for investment and growth. What they do not emphasise is the other dimension of wage, i e, wage as income to the workers. The constraint in the Indian context is the narrow base of the effective demand arising from the income of workers because of the small size of the organised sector in the total workforce. Instead of posing the protective labour legislation as a barrier in enhancing employment and growth in the organised sector, shouldn't the emphasis be on extending progressively the protective labour legislation to the unorganised sector with such interventionist strategies as to help increase labour productivity in that sector? Such a 'levelling up' approach is required to reduce the wide gap between the earning levels and working conditions between the two sectors. This could lead to a demand regime more favourable to the growth process that caters to meeting the wage goods requirements of a wider segment of the population.

TABLE 2: ANNUAL AVERAGE GROWTH RATE IN LABOUR PRODUCTIVITY, PRODUCT-WAGE, AND CONSUMPTION-WAGE IN FACTORY SECTOR

Industry Group	73-74/85-86				80-81/85-86			
	$\dot{LP}$	$\dot{W}_w$	$\dot{W}_c$	$\dot{LP}$-$\dot{W}_w$	$\dot{LP}$	$\dot{W}_w$	$\dot{W}_c$	$\dot{LP}$-$\dot{W}_w$
1 Food products	8.98	7.08	3.79	+1.9	15 67	11 45	7.94	+4.22
2 Beverages, tobacco and tobacco products	6.38	4.72	4.45	+1.66	10 82	8 71	6.87	+2.11

III
Traditional Labour Institutions in Labour Market Segmentation

Here we are primarily concerned with examining the rôle of caste (or community in certain regions) and gender-based labour market segmentation and their impact on economic development. There is likely to be very little disagreement in pointing out the role of caste and gender as the most important bases of segmentation and discrimination in the Indian labour market. This has also been associated with the notions of 'good jobs' and 'bad jobs' or a hierarchy of jobs in terms of their social status. But this is also not devoid of economic content. Often the earning levels also reflect a hierarchical structure corresponding to the social status attached to occupations.

From a basic point of view the labour market segmentation is manifested in terms of the degree of vulnerability (which can be translated into the presence or absence of protection). It ranges from a small segment which is most favourably placed to a large segment that is most unfavourably placed. The correspondence of this ranking to the organisation of production in the economy is not incidental; in fact, the multi-structural character of the economy is integrally related to the status of labour in various segments. This has even led to such implications as whether some segments of the labour force are recognised as workers proper or not. A small segment of the labour force represents the workers in the organised sector enjoying protection and regularity in employment. A larger segment of the labour force consist of those workers in the unorganised sector. The latter may be divided into two groups; one, those who may be called wage workers enjoying very little protection and/or regularity in employment and, two, those who are self-employed because they survive by engaging in selling the products of their labour without an identifiable employer. Formal autonomy does not make much difference to their vulnerable status in terms of employment and income. Then there are those who are not even recognised as workers proper because their labour is often not remunerated and these are the unpaid workers in and out of the household engaged in activities linked up with production. Segmentation in these various categories are often along caste and gender lines which are inherited endowments. And these get reinforced by the lack of such endowments as education which could have been acquired. The segmenting role of caste and gender-based institutions in the labour market have not been easy to reduce, let alone eliminate. There are different ways in which they operate. Discrimination is the most obvious form and this refers to a strategy of exclusion from certain labour markets and jobs. Thus both pre-entry and post-entry labour market discrimination operates.

Since aggregate data on castewise occupational distribution are not available, no precise empirical substantiation (except for the lower-end categories of scheduled castes and tribes) can be provided at that level for the correspondence between caste status and labour status. Broadly speaking three categories are used both in official and other studies and these refer to a three-tier classification of upper, middle and lower social classes. It is the middle stratum which has the most complexity because some social groups have been able to advance economically mainly through agriculture and related occupations. But from the point of labour market segmentation, such a classification is not altogether irrelevant.

Persons belonging to the lower social classes, e g, scheduled castes, find themselves confined to a limited number of occupational categories. This is despite affirmative action policies in the labour market. It should however not come as a surprise because the affirmative action policies apply to only a part of a small segment of the labour force, i e, public sector jobs in the organised sector. Most of them find themselves in rural (agricultural) occupations, casual in status, unskilled and low paid. Gender-based discrimination fall on women. And this also runs across all categories of employment. Table 3 presents four broad occupational distribution for workers belonging to non-scheduled castes/tribes, scheduled castes and scheduled tribes separately. Only 18 per cent of the non-SC/ST workers are in the category of agricultural labourers while it is 48 per cent for SC and 33 per cent for scheduled tribe. However, the distribution has a clear gender dimension shifting these proportions to 39, 68 and 46 per cent respectively for women workers. The distribution within the scheduled tribe population as cultivators and agricultural labourers should be understood in the light of the fact that traditionally this group cultivated their own land, owned communally. The proportion of agricultural labourers is an indication of the process of proletarianisation among them. The occupational diversification is also limited for the workers in SC and ST as can be seen from their share in non-agricultural occupations. Under the non-agricultural categories, a high proportion of workers belonging to SC and ST are likely to be in low status and low earning jobs. While there is reason to believe that gender-based discrimination at the upper-end characterised by higher education, household income and social status are likely to be less sharp than at the bottom, it is not difficult to find discrimination manifesting in terms of job-typing reflected in women's opportunities confined to certain type of jobs. Thus in Kerala, a state characterised by much less inequality in social development indicators as between men and women—as for instance, in sex ratio, literacy, school education and morbidity—evidences of labour market segmentation in white collar services are not hard to find [Simon 1993].

What makes caste- and gender-based discrimination inhibitive to economic growth and distribution is its implications on earning capacity and thereby income levels. Labour market segmentation characterised by discrimination in terms of jobs and remuneration also imply a pattern of stratification according to income, among other dimensions. Thus one may discern a structuring of the labour market in terms of labour status with the low caste, poor, rural women at the bottom and the high caste, better off men at the top. This is not confined to the rural areas only because of the socially stratified nature of land ownership; it has been carried over to the urban areas as well although most occupations there are not land-based. Thus, a study of the labour market in Bombay City showed its segmenting characteristics as socially and economically embedded in rural areas. Of the three types of employment, casual, small establishment and factory, those in casual employment had the least income, hardly any increase in real earnings over time, and were the least mobile.

TABLE 3: PERCENTAGE DISTRIBUTION OF MAIN WORKERS AMONG NON-SC/ST, SC AND ST POPULATION IN INDIA, 1981

Category		Total Main Workers	Cultivators	Agricultural Labourers	HH Manufacturing, etc*	Other Workers
1 Population	P	100	43	18	4	35
Other plan	M	100	44	14	3	39
SC and ST	F	100	36	39	6	19
2 Scheduled castes	P	100	28	48	3	21
	M	100	32	42	3	23
	F	100	16	68	4	12
3 Scheduled tribes	P	100	54	33	1	12
	M	100	60	26	1	13
	F	100	44	46	2	8

Notes: * Consists of household industry, manufacturing, processing, services and repairs
P = Persons; M = Males; F = Females.

They were mostly poor migrants from rural areas, less educated and with few sources of financing their costs of job search. About 60 per cent of the women workers were in casual employment. "Due to lack of sectoral mobility, the casual worker continues to be employed at the lowest rung of the socio-economic ladder in Bombay just as he was in the village. Thus in a sense, the segmentation of an urban labour market begins in the villages" [Deshpande 1983:39]. Although studies of this kind bring out the nature of labour market segmentation, not many studies have systematically attempted to correlate the inherited and acquired characteristics of workers with their status in the labour market with a view to examine how labour markets are structured given the deeply embedded segmenting and discriminating propensities. Mention may be made here of a methodological study of urban workers in an industrially dynamic city in South India (Coimbatore in Tamil Nadu) which came out with at least eight status groups for labour reflecting the stratified and segmented nature of the labour market [Harriss, Kannan and Rodgers 1990].' These status groups consisted of those ranging from the least vulnerable and most protected category to the most vulnerable and least protected categories. Table 4 shows the correspondence of these labour statuses with poverty (income), gender division, caste/community, family background, education, etc. When these characteristics have been classified in terms of "inherited characteristics" (gender, caste, urban/rural background, and father's education) and "acquired characteristics" (own educational attainments), it was found that a large proportion of those with favourable conditions (89 per cent) were in the highest status groups (Protected Regular and Self-employed with Capital as shown in rows 1 and 2 in Table 4), i e, the most protected and/or least vulnerable groups.

Similar findings emphasise that segmentation and discrimination in the labour market are embedded in the socio-economic structuring of the society in India. This is especially so in the rural context with regard to workers belonging to low caste groups who are caught in the vicious circle of low earnings, low consumption, low education, low skill reinforcing their low earning capacities. Studies from a sociological perspective have brought out vividly the nature of the impact of segmentation and discrimination on the rural poor, often of low caste and their resultant survival struggles [see, e g, Breman 1985]. When women happens to be at this lower end, their life and work are a daily struggle for survival [see, e g, Gulati 1984].

Our argument here is that such a deeply segmented labour market is inhibitive of the objectives of economic development in terms of both economic growth and distribution. The arguments based on distribution are well known. The most important of this is that segmentation and discrimination exclude people in entering certain types of occupations as well as moving from one occupation to another. This leads to exclusion from opportunities for maximisation of income and economic welfare. This is often the basis for introducing affirmative action in the labour market. However, in the Indian context there are severe limitations for affirmative action in the labour market for two reasons. One is that, as mentioned earlier, the size of the labour market where affirmative action is introduced is limited to one segment of the organised sector i e, public sector jobs. This constitutes only around 3 per cent of total employment. Although this is important because of the prospect of higher security and standard of life for workers, its impact on alleviating labour market segmentation and discrimination would be only marginal. Secondly, the affirmative action in the labour market applies to persons with a minimum of work-oriented capabilities. That is to

TABLE 4 LABOUR MARKET SEGMENTATION CHARACTERISTICS IN COIMBATORE
(Percentage distribution in selected characteristics)

Labour Status		Percentage of Jobs	Caste: Low	Caste: High	Gender: M	Gender: F	Secondary Ed and Above: Father's	Secondary Ed and Above: Own	Those with Rural Bk grd	Those below Poverty: Income	Those below Poverty: Consumn	Favourable Endowments
PR	Protected regular wage work (permanent jobs with a written contract and legal or union protection)	31	26	39	26	31	50	49	46	5	8	44
SC	Capital owning self-employed (capital threshold Rs 200 in 1987)	14	3	18	13	6	9	16	50	25	15	39
URL	Unprotected, regular long-term wage work (apparently permanent or long-term in nature but have less contracted or union protection than PR)	24	29	22	27	24	21	24	40	23	26	6
URS	Unprotected, regular short-term wage work (jobs paid on a daily or piece-rate basis without written contract or other protection)	9	7	3	9	7	-	3	60	48	33	-
UI	Unprotected irregular wage work (distinguished from the previous categories by irregularity of work)	11	21	1	9	15	3	3	50	75	60	6
IW	Independent waged work (a category of workers without a single employee entering into a sequence of wage relationships of short duration)	5	6	3	6	4	6	1	50	6	40	-
SM	Marginal self-employed, without capital	6	8	20	6	20	12	1	60	67	33	6
	All categories*	100	100	96	98	97	100	97	-	-	-	100

Notes: 1 * Indicates that wherever the total does not add up to 100 the remaining percentage of workers belonged to the category of family workers.

2 The percentage distribution of these below the poverty line refer to the principal earners. The poverty measures have been given in terms of both income and household consumption. Household consumption here represents a composite index in terms of consumption and assets, such as house size, availability of drinking water, electricity, expenditure on clothing, no of rice meals per day, etc. For details see Harriss, Kannan and Rodgers (1990) chapter 5).

3 'Favourable' endowments is a combination of favourable inherited characteristics such as gender (male), caste (upper), urban/rural origin (urban) and father's education (educated) and acquired characteristic namely, own education (secondary and above).

Source: Compiled from Harriss, Kannan and Rodgers (1990)

say, job-seekers are the same in every respect except say, caste. This is rarely the case because of the nexus between caste and gender on the one hand and other disabling characteristics as illustrated in Table 4. This further restricts the scope of affirmative action in the labour market in reducing labour market segmentation and discrimination. From a policy perspective, this implies extending the scope of affirmative action beyond the labour market. The absence of such a policy in a context of economic growth will mean that the incremental benefits of growth in terms of 'better jobs' will be shared among a narrow segment of the population leading to further accentuation of the inequality in the society. Evidence to this has been found in the context of the economic policies in the US and UK in the 80s (reported in Rodgers 1993). In the Indian context this is not without relevance because of the new economic policy emphasising privatisation, competition and technological change.

The growth implications of labour market segmentation is not as easily appreciated as the argument based on distribution. Policies aimed at accelerating economic growth could be constrained by labour market segmentation by a number of ways. One is the limited scope for expanding the effective demand in the economy. A segmented labour market in the Indian context also implies exclusion of a majority of the labour force from higher income earning occupations. This results in insufficient growth in purchasing power of the majority. Consequently it affects the economy's potential for increasing the demand for wage goods which could act as a stimulant to further growth of the economy. A national surplus of foodgrains (in terms of buffer stocks) and hunger of a significant proportion of the population is a reality in India and the latter is basically a reflection of the lack of purchasing power of the poor who perhaps toil more to earn less. It is quite probable such an internally stimulated growth process—increasing purchasing power of the poor who are also discriminated—could contribute to a better management of external balance in an economy faced with foreign exchange constraints. This is because the import content in satisfying the increased wage-goods demand is likely to be less than the increased demand emanating from the relatively better off sections. By the same logic, a structure of demand in favour of wage goods imply a structure of production for wage goods and this will have greater linkages with domestic sectors and resources.

Economic development is not merely one of growth and its distribution in the mechanical sense. It also involves qualitative changes in the labour force via human resource development resulting in increased productivity on the one hand and technological change which could enhance the total productivity. Let us take the former first. There are two aspects here; one relating to skill formation and development over larger and larger sections of the labour force and the other enhancing capabilities of the excluded groups. In a segmented labour market of the type in India, there is hardly any possibility for skill formation among the excluded. Such a situation in turn strengthens segmentation because of the inability of the excluded to compete effectively in the labour market even in a situation of affirmative action in the labour market. For the economy, it means dependence on a smaller segment for skilled occupations. It thwarts the spread effect of skill formation because of the limited linkage between the occupations of the excluded and unskilled with that of the skilled. Spillover effects from the organised sector to the unorganised sector might then be quite restricted. But the second aspect of capabilities of the excluded has a long-term implication. Those who are excluded often lack in basic capabilities say, literacy, education, nutrition and health and this is reinforced by their excluded status in the labour market. So there is a larger vicious circle which could be seen as operating through the labour market because wage income is the single most important means by which the poor could hope to get out of their situation of poverty. An abundant labour supply therefore does not constitute itself as an advantage in the process of growth; it could even be a constraint if such labour lacks in basic capabilities and occupational skills of higher economic value.

The implications for technological change are also not difficult to discern. When the economy has a large proportion of its labour force subject to labour market segmentation and discrimination and perforce work in low wage occupations, it also adversely affects the incentive for technological change. On the one hand the abundant labour provides a source of cheap labour leading to exploitative conditions of work reminiscent of predatory capitalism and this often inhibits technological change. Even in the organised sector production could be increasingly carried out through such arrangements as sub-contracting. Secondly, the low purchasing power of the majority of the labour force would not give any emphasis on quality in production because of the compulsions to keep prices as low as possible to meet the demands of low-income market. This could also add to the tendency for increasing quantitative production without regard to quality because of the limited size of the market for the latter. Often low quality of production is attributed to protective domestic market on which there is considerable literature. However, the structure of income reflecting a high weightage of low income groups could also act as a deterrent to production of quality goods. While this possibility has not attracted the attention of researchers, this is what we would find in reality even when domestic protective barriers are sought to be removed.[4]

IV
Labour Market Policies, Affirmative Action and Economic Development

The discussion so far lead us to formulate two hypotheses in the Indian context. One is that the presence of such modern labour institutions as unions and protective labour legislation need not be incompatible with the objective of growth. Second, the traditional labour institutions of caste and gender-based labour market segmentation and its attendant features of discrimination and stratification are incompatible with the objectives of both growth and distribution. If the validity of these hypotheses are prima facie accepted, then they have an important bearing on labour policies.

The implications for labour market policies are clear enough. If such modern labour institutions as unions and protective labour legislation are seen as essentially contributing to a process of 'levelling up' of the living standards of labour, then the presence of such institutions for those who are not covered by it is a desirable social objective. In concrete terms, the absence of such institutions would probably explain the low earnings and high vulnerability of workers in the unorganised sector in India. A 'levelling up' strategy implies encouraging their presence in the unorganised sector. In growth terms, they should act as incentives for technological and skill upgradation and more efficient forms of organisation of production. Labour market policies should therefore aim at reducing the vulnerability of unprotected workers and progressively eliminate the conditions favouring exploitation of cheap labour.

Labour market segmentation and its attendant features of discrimination and stratification call for affirmative action policies. Given the well-entrenched nature of social segmentation and discrimination, affirmative action in the limited sense of job reservation in the organised sector is unlikely to have any long-term impact on growth and distribution. We therefore argue for a broader definition and operational jurisdiction for affirmative action at three levels.

First, at the level of the labour market for positive discrimination in favour of those constrained by caste and/or gender considerations in access to jobs. In the Indian context this is constitutionally guaranteed for those belonging to the scheduled castes and tribes, i e, lowest rungs of the Indian society. In several Indian states, especially in southern India, legal enactments for such

positive discrimination have also brought in the middle level social classes, referred to earlier. And recently, this policy has been accepted at the national level by the central government, after a period of politically charged social turmoil.[5] Unlike in the US, for example, this policy of affirmative action in the labour market is restricted to public sector jobs. And given the size of the public sector employment in total employment, this is unlikely to have anything more than a marginal impact although it has a much bigger symbolic value. Although this might, in the short run, deny access to jobs for a small segment of job seekers from the socially non-disadvantaged groups, it is unlikely to produce any adverse impact in the long run. The fact that non-disadvantaged groups in general have relatively more resources—socio-cultural, political and, economic—at their command will enable them to be more resourceful in finding or even creating appropriate economic opportunities. And perhaps this might make them less dependent on public sector, especially white collar, jobs.

At the second level, there is need for affirmative action aimed at building work-oriented 'capabilities' for those who are not qualified to compete in the labour market. This is a much larger segment of the population who are found in the unorganised sector of the economy in a variety of occupations both in urban and rural areas hardly offering any protection and/or regularity in employment. These are often not the absolutely poor but those at the margin of poverty with some minimum of consumption. Affirmative action in the form of job reservation is hardly sufficient to them. As the figures in Table 3 would indicate, they need affirmative action aimed at access to education, training and skill development so that their pre-labour market discrimination is taken care of. Affirmative action policies in this case are directed outside the labour market and have a long-term objective of building up and improving the capabilities of the labour force in the economy. Without adequate investment in human resource development on a broader scale economy-wide increases in productivity, across occupations, are hard to achieve.

At the third level, affirmative action policies will have to address those who cannot even hope to build up capabilities because of their severe disadvantages. These are the assetless, rural, poor labourers without any access to obtaining basic capabilities. A large proportion of women belong to this category as the figure in Table 3 testify. Investment in human resource development such as education and health, even at the minimum, warrants some staying power. And those who do not have that are the assetless, mostly without stable employment. Affirmative action aimed at providing a minimum of staying power to this segment of the labourers is linked to such policies as distribution of land, provision of credit, food security and some guaranteed employment, as a precondition for enabling them to avail of the access to education and health. The absence of these often manifest in the form of, among other things, child labour as a survival strategy of such poor households. Therefore, efforts for achieving, for example, compulsory schooling for children, will have to start with an attack on parental poverty. This might not only prevent 'intergenerational transmission of poverty' but could convert the 'non-competing groups' into 'competing groups' in the labour market. Studies testify that given equal opportunity and economic security, children from even the socially most disadvantaged segments prove to be as intelligent as their counterparts from non-disadvantaged background [Thakur 1992].[6] It is pertinent here to note the observations of the National Commission on Rural Labour [GOI 1991: vi-viii] with regard to land distribution and human resource development and their link in enhancing labour productivity.

> The immediate impact of widespread landlessness is on the wages of agricultural labour. It has been generally observed that market wages for agricultural labour are higher wherever agricultural labourers have a better bargaining power in such situations on account of their land base.
>
> A major deficiency of our plans, particularly in the first two decades, has been the relative neglect of human resource development and basic needs, e g, education, health, housing, drinking water, sanitation, etc, in rural areas. The attempts in the last two decades to provide such amenities have not succeeded in making good the backlog created in the earlier period. The proper targeting of these facilities for the poor and the needy is yet to be achieved. The rural poor, particularly in the remote areas, have very little access to the supplies of essential commodities like foodgrains from the public distribution system.
>
> The rural poor cannot afford to send their children to schools unless employment opportunities are increased and wages are high and children are provided support for attending schools. The widespread incidence of child labour is due as much to unemployment and poverty as to the lack of facilities for compulsory primary education. Productivity of rural labour, present as well as potential, is impaired by the lack of human resource development.

The argument contained in the above statement is not only based on distributive considerations; it acknowledges the link with growth through increases in productivity. Our attempt has been to emphasise the growth implications of the inequitous and segmented nature of the labour market. Such a viewpoint goes beyond Mandal Commission Report and job reservations. It would certainly acknowledge the exclusion of all those beyond a certain level of income for applying affirmative action since income is the single most important factor in determining living standards and acquisition of a variety of capabilities. It takes into account the need to do away with the segmented nature of Indian labour market which is seen as a constraint on growth, certainly of a broad-based one. And this is not just good social policy; it is good economic policy too.

Notes

[This is a revised version of my keynote paper on Labour Institutions and Economic Development in India presented at the Thirty-fifth Annual Conference of the Indian Society of Labour Economics held during January 21-23, 1994 at the Gandhi Labour Institute, Ahmedabad. I am grateful to T S Papola for inviting me to present the paper. Comments received from the participants of the conference are gratefully acknowledged. I am thankful to I S Gulati, Gerry Rodgers, and K Pushpangadan for their comments and suggestions on an earlier draft. The usual disclaimers apply.]

1 Even in communities such as Muslim and Christian, which do not formally admit caste-based division of its population, are influenced by the institution of caste and hence similar stratifications are discernible.

2 "Another sphere of needed reform also seems pressing, namely, with respect to job security legislation which raises the effective cost of labour and hence encourages the choice of more capital-intensive techniques, thus limiting industrial employment and hurting export competitiveness in otherwise labour-intensive activities" [Lucas 1988:192]

"The fact that employers are unable to offer lower wages, despite now being obliged to provide greater job security, is not surprising in either country. In India, the growing power of trade unions plus minimum wage legislation have no doubt confounded any downward pressures on wages that might otherwise have arisen" [Lucas and Fallon 1989:20]

"There is indeed quite strong evidence consistent with the job security regulations having diminished employment across a wide range of industries, compared to what it might otherwise have been" [ibid:27].

"The legal framework and government apparatus regulating industrial labour and labour-management relations have generated disincentives to employment growth in organised manufacturing". "Regulations restricting retrenchment of workers and closure of factories are a disincentive to expansion of organised sector employment, since firms are stuck with the labour they have hired even if business declines or if workers do not perform well"... "The statutory payment of annual bonuses and other benefits has strengthened disincentives to hire workers"... "The direct cost of labour to employers has increased sharply in recent years, in part due to the substantial overindexation of wages which occurs through the system of 'dearness allowance'" [World Bank 1989:112-13].

"The evidence on an across-the-board slowdown in employment in the manufacturing sector in the first half of the eighties is

unambiguous. For the manufacturing sector as a whole, employment declined at the rate of 0.7 per cent per annum. A number of factors contributed to the decline in employment. First of all, there was the fact of a sharp increase in the real wage rate during this period, after a prolonged phase of wage stability. Bias against adding to employment may also have arisen from the resistance of managements to handle a large workforce in an environment infested with multiplicity of unions and inter-union rivalry" [Ahluwalia 1991:193-94].

3 Since we are interested in finding the difference between the growth rates in per capita labour productivity and product wage, it will not make any difference whether the current values are deflated or not. This is because the deflator used in the left-hand side (gross value added per employee) will have to be used in the right-hand side also (earnings per employee). We have however worked out the real values of per capita labour productivity and product wage using the wholesale price index for the manufacturing sector because it gives us an idea of the growth in real labour productivity on the one hand and a comparison of the growth in real product wage *vis-a-vis* real consumption wage on the other.

4 This is what would happen in the Indian context in the era of liberalisation and globalisation. A part of the production would be geared to the high income export market as well as a narrow domestic one. A gradation of low priced and low quality products would at the same time be for the income-based segmented domestic market. Examples are soap, clothes, etc.

5 One of the arguments against job reservation in government job is its likely adverse impact on the efficiency of public administration. It is unlikely to attract many adherents if one were to say that the quality of public administration in the southern states (where 50 to 69 per cent of the jobs are reserved for the socially disadvantaged groups) is inferior to that found in say, Uttar Pradesh, Madhya Pradesh or Orissa where the reservation issue (except for scheduled castes and tribes) has been only recently (or in some cases, yet to be) addressed.

6 The popular perception is that children from socially disadvantaged sections (e g, scheduled castes) are intellectually inferior to the non-disadvantaged groups. And studies in the field of disadvantaged children reveal their poor intelligence when such studies are conducted in the setting of impoverished environment. When the setting of the study is shifted to the non-impoverished environment, the disadvantaged children (of educationally and economically well endowed parents) show no such inferior intelligence. A study by Thakur (1992) of students belonging to scheduled castes and brahmins in two central schools in Jaipur deserve to be mentioned here for its far-reaching findings. "Most of the studies in the field of disadvantaged children in India as well as outside have been carried out in the setting of impoverished environment, and these studies reveal poor intelligence of disadvantaged children in terms of low IQ, academic backwardness and drop-outs. Such results are attributed to impoverished environment."

"The present study examined the intelligence of socially disadvantaged or scheduled caste children. The problem posed was that if such children were affiliated to professional and administrative fathers and they studied in good schools, could they still show low IQ? The analysis of this study reveals negative answer to it. That is, if fathers" occupation and school environment are controlled, then we do not observe differences in scheduled caste and non-scheduled caste children on IQ. Interestingly enough, gender effect was also not found. Furthermore, the joint effect of caste and sex also turns out to be insignificant. This may be due to similar attitudes for male and female children by professional and administrative fathers. They give as much importance to the female child as to the male child".

"The findings of the study are very important in the sense that if parents' occupation, home status and school environment are raised and made intellectually stimulating, then the cognitive development of children takes place properly irrespective of their caste and gender. The study supports the environmental bias in the cognitive development of children. It confirms Piaget and Hunt's theory that experience plays a significant role in cognitive development" [Thakur 1992:51]

Speech by the Chairman Mr. Mantosh Sondhi

At the Company's Eighth Annual General Meeting held in Bombay on June 29, 1994.

Ladies & Gentlemen

It gives me great pleasure to welcome you to the 8th Annual General Meeting of your Company.

The report and accounts of your Company, including the notice to the shareholders, have been in your hands for some time and, with your permission, I shall take them as read.

As you are aware, the Company's order book suffered a great deal during the period under review as a result of the severe industrial recession which affected the entire Capital Goods Industry. Process industries deferred investments in capital goods in the face of increasing international competition and domestic demand contraction. Under these conditions your Company's income fell to Rs. 54 crores in 1993, earning a net profit of Rs. 82 lakhs.

The Economy

The process of economic reforms is continuing, slowly but surely. Customs duties have been lowered across-the-board, direct and indirect taxes have been rationalised and reduced, interest rates have been brought down and the Rupee has become convertible on trade account. The macro economic indicators such as burgeoning foreign exchange, largest ever buffer stock of foodgrains reserves, steadily increasing exports, stability of the Rupee and an overall improvement in industrial growth including the capital goods sector and with the monsoon already off to a good start for the seventh successive year, all these augur well for a healthy economic revival notwithstanding the large fiscal deficit and the high rate of inflation. However, the infrastructure continues to pose a threat and so long as this remains a serious bottleneck, it may not be possible to achieve our targeted growth in GDP. Rapid development of infrastructure with the optimisation of its design and operation, therefore, requires immediate and very careful attention of both the Government and the Industry. This in fact is the key to the success of our economic reforms.

The Power Scenario

Obviously power is fundamental for our economic development. According to the 14th Electric Power Survey of India, India's peak demand projected for the year 2010 is 172, 262 MW. Thus, for the next 15 years, we need to add an average of 6500 MW each year to our present installed generating capacity of 70,000 MW. This is tantamount to adding in 15 years 150% more capacity than we did in the last 45 years. Our power development programme therefore needs to be positioned in the fast track. Despite this knowledge, and notwithstanding the experience of generating 21,000 MW in the Seventh Five-Year Plan, the addition to installed capacity in the Eighth Five-Year Plan ending 1997 is unlikely to exceed 14,000 MW. This dismal performance will result in a peak power shortage of 25% and energy shortfall in excess of 14%. These shortfalls can be mainly attributed to resource constraint. The resources required at over Rs. 4 crores per MW are staggering and financing is undoubtedly a formidable and daunting task. And it is obvious that India's seemingly insatiable appetite for energy necessarily demands foreign help. With the Government's recent policy initiatives, the Indian energy scene is attracting the world's largest power companies. Of some 35 proposals considered by the Government, eight projects aggregating 5600 MW have been granted approval, at an average cost of Rs. 4.26 crores per MW. Three of these projects are nearing their "financial closing", as a new era in power financing is beginning to dawn.

A nation with such immense power needs as India cannot do without the multinational mega projects for its long-term infrastructural development - notwithstanding the high capital investment, the long gestation period and the resultant high total cost of generation. However, in the intermediate term, the answer for India - as elsewhere in the developing world - lies in setting up efficient, reliable, decentralised captive power plants close to energy consumers - plants having short lead times and low overall cost of generation. Such solutions that obviate, or limit, the need for high distribution costs and high transmission losses are emerging as the most viable options for a power-starved world. Modular Diesel Power Plants with multifuel capability and operational flexibility can cater to changing fuel supplies, different running patterns and ever-increasing power demand.

Advancements in Diesel Engine technology have seen the emergence of fuel efficient prime movers that have multi-fuel capabilities, that satisfy the requirements of different load patterns - from base load to emergency operations - and that are environment friendly. Above all, the factors of reliability, high availability and overall efficiency provide for a low total cost of generation. Today, diesel engines command 12% of the total world market for new power generation for utilities and industrial power plants of over 1MW in size. This market is currently

about 60,000 MW a year and is expected to remain at this level for at least the next decade.

In this scenario, the inherent strengths of your Company place it in a unique position to meet the challenges of India's dynamic growth in the years ahead.

Our Collaborators

The Wartsila Diesel Group further strengthened its position during the year as the world's largest producer of medium-speed engines - both for land-based captive power and for marine applications. Deliveries during 1993 totalled a new high of 2400 MW, with both the Marine and the Power Plant Businesses establishing record deliveries of 1000 MW and 1400 MW respectively. The Group's sales grew impressively by over 30% to approximately USD 1.4 billion.

The Power Plant market was extremely buoyant particularly in South East Asia and East Asia. The Group effected large deliveries to Utilities and IPPs engaged in massive power development programmes to support the rapidly expanding economy in China and to remedy the severe shortage in the Philippines. Deliveries to Philippines alone totalled 400 MW during the year. The Group succeeded in securing a 20% share of the global diesel power market. The Power Plant business contributed 50% of the Group's total turnover in 1993. Wartsila Diesel have supplied six 100 MW plus power plants around the world, setting the pace in establishing diesel engines as a viable alternative for captive power plants of capacities upto 200 MW.

The Wartsila Diesel Group continued to make extensive investments in their new heavy fuel range of diesel engines and in gas engine technology. The major emphasis in new engine development was on reliability and fuel economy and was focused on lowering harmful emissions. The aim is to achieve as low emission levels from diesel engines as from any other prime mover burning fossil fuels. Your Company continued to receive active support and encouragement from the Collaborators. Not only did they support the Company in the form of placing export orders for engines, but they also helped increase competitiveness by maintaining the price levels of components constant over the past two years.

Training and Development

Your Company's training and development activities encompassed skill - specific programmes and workshops designed to ensure continuous improvement in the reliable and efficient operation of customers' power plants.

Management development programmes included modules on leadership, marketing and teamwork, especially designed to focus on orienting people's skills and attitudes towards satisfying customer needs and expectations.

Technical training programmes utilised the expertise of specialists from within the Company as well as from our collaborators and our vendors, to provide actual hands-on and on-site training interspersed with classroom inputs. All training programmes are continually reviewed and updated, based upon field experiences and technological improvements.

Technical training and skills development was also achieved through ongoing visits by Technical Service, Project Management and Technology Teams from Finland, and through specific training visits by Company personnel to collaborators' facilities in Europe.

Outlook and Prospects

The year 1994 started with an order backlog of about Rs.'50 crores. In the six months to date your Company has secured orders valued at over Rs. 60 crores, and the present order backlog is close to Rs. 90 crores. Additionally, your Company has secured orders for imported power plants valued at approximately Rs. 75 crores and for imported marine engines of the value of Rs. 9 crores. Moreover, with an impressive list of prospective projects on the anvil, I am encouraged to share with you my optimism of a much improved performance this year. It is estimated that about 170 MW of captive power plants will be delivered during this year, taking the Company's installed base to about 600 MW.

An interesting feature of our order book is the spurt in business from the textile and man-made fibres industry, which, during this year, will account for an installed base of 90 MW, up from 15 MW last year, representing 15% of the total population of Wartsila Diesel plants in 1994. Production of man-made fibre and yarn during 1993-94 registered an increase of 16% over the previous year. Exports of synthetic and rayon textiles grew by an impressive 19%. It is expected that companies in this sector will continue to perform well this year also.

In order to better exploit India's extensive coastline, coastal shipping is developing as an important growth industry; a spurt in the building of coastal vessels offers immense opportunities for marine engines from Wartsila Diesel's extensive engine portfolio. The development of ports has opened avenues for marine engines for applications such as tugs and dredgers. Your company has been active in booking orders in this market. With further development in this field, we are confident of increasing our market share in the marine business area also.

The private power development sector continues to present interesting opportunities. Letters of intent have been received and MOUs signed with several interested power developers, and it is expected that the implementation of some of these projects will commence before long.

So all in all the future prospects of your Company are extremely promising.

Contraband Trade and Unofficial Capital Transfers between Sri Lanka and India

Muttukrishna Sarvananthan

The unofficial two-way contraband trade between Sri Lanka and India overshadows the official trade and capital transfers between the two countries. Quantitative estimates of this unofficial trade and transfer of capital are, however, hard to come by.

This article attempts to make some estimates of contraband trade and unofficial capital transfers and proposes some solutions to the problem that this poses to the economies of the two countries.

I
Introduction

INDO-SRI LANKA economic relations are centuries old. Our common cultural heritage and historical roots have fostered deep-rooted economic links between the two countries from time immemorial. The intention of this paper is not so much as to look back at Indo-Sri Lanka economic relations in the distant past, but to look forward to strengthening the inextricable economic linkages for the mutual benefit of the peoples of the two countries. Our common vision for the future gains added significance due to the remarkable changes taking place in the economic front at home (south Asia) and abroad (rest of the world).

Although Sri Lanka has been the pioneer of this economic change in south Asia, not until India embraced the ideal of free market economy recently did the world realise the full potential of the south Asian market. This is due to the vastness of the Indian market and the huge natural and human capital endowments of India. In this context it is imperative that Sri Lanka explore the possibilities of increasing the two-way trade and economic relationship in light of the opening-up of the huge Indian market.

In the process of identifying new opportunities for boosting the two-way Indo-Sri Lanka trade and economic relations in general and Sri Lankan exports to India in particular we were bewildered by the paltry sum of exports to India which is a tiny fraction (about 0.6 per cent in 1991) of the total Sri Lankan exports. On further probing this phenomenon we discovered a huge contraband trade and unofficial capital transfers between the two countries. This factor compelled us to undertake a specific study of the modalities and extent of contraband trade and unofficial capital transfers between the two countries. Because we cannot possibly espouse meaningful recommendations to boost Sri Lankan exports to India without gaining sufficient knowledge of this underworld trade and capital transfers.

This paper is an outcome of this need. Unfortunately, to the best of our knowledge, there does not seem to be a single study on this subject matter in Sri Lanka either at the academic, professional or governmental level. The contraband trade and unofficial capital transfers between Sri Lanka and India is no secret. However, what we did not know was the true magnitude of the subject and the effects of the same.

The following section of this paper outlines the methodology adopted for this empirical study. Section III of the paper outlines the limitations of this empirical study. In Section IV we undertake a study of the official trade between Sri Lanka and India in the recent past. Section V which is the core of this paper is an empirical study of the modalities and extent of contraband trade unofficial capital transfers between Sri Lanka and India.

Our empirical study covers the period from 1977 to 1992. The reason for choosing this period is that the contraband trade and unofficial capital transfers between Sri Lanka and India has accelerated due to the opening-up of the Sri Lankan economy in 1977.

We have established from our empirical research that the contraband exports from Sri Lanka to India is about 10 times higher than the official exports from Sri Lanka to India. Also we have established that the two-way total contraband trade between the two countries is higher than the two-way total official trade between the two countries. These quantitative estimates are the minimum sum we could arrive at and the true figures will be higher than our conservative estimates. Hence there is a roaring contraband trade and unofficial capital transfers between the two countries which shadows the official trade and capital transfers.

In Section VI we provide our conclusion of this empirical study by way of proposing free trade between Sri Lanka and India. We arrive at this conclusion from our empirical analysis of the contraband trade and unofficial capital transfers between the two countries. Our recommendation of free trade is made from the study of a concrete situation and based on economic reality and economic rationality as reflected in Indo-Sri Lanka economic relations (both official and underworld). Therefore our proposal is not derived from a dogma or an ideology espousing free trade. Rather it is a natural outgrowth of our empirical research and an evolution based on rational economic principles. By free trade we mean the free movement of goods and services and capital between the two countries. The cardinal contributions of this paper are the assessment of contraband trade and unofficial capital transfers between Sri Lanka and India and the proposal for free trade between the two countries.

II
Methodology

This study is based on empirical research. Field research was undertaken during the months of November and December 1992 in the city of Colombo and its suburbs. We interviewed numerous people at two levels—one at the official level and the other at grass roots level. At the official level we interviewed numerous personnel at the following institutions—Sri Lanka customs department, department of exchange control, the Central Bank of Sri Lanka, the Indian High Commission, Air Lanka and the Indian Airlines. Even at the official level we interviewed two categories of personnel to obtain maximum information and to verify the information thus obtained. That is, for example, at the customs department we interviewed numerous ordinary customs officers as well as top officials from the preventive and the intelligence and investigations divisions. Likewise similar kind of work was done at other institutions also. At the grass roots level we interviewed a few bona fide exporters to and importers from India and several traders directly or indirectly involved in contraband trade and unofficial capital transfers between Sri Lanka and India.

In the final analysis the scattered information gathered were tested for consistency, complementarity and contradictions. We have tried our best to reconcile the informations obtained by checking and verifying the accuracy to present an authentic set of information. To the best of our knowledge and capability the qualitative and quantitative informations presented are very much reliable. We do sincerely hope that this information will be valuable for future researchers. In the main text we have explained the methods used for our estimation where necessary. All the data in this paper is in Sri Lankan rupees unless otherwise noted.

III
Limitations

It is the nature of our subject matter that it is highly secretive and controversial. Therefore it is natural that our present empirical research study has its inherent limitations. A salient feature of the contraband trade and unofficial capital transfers between Sri Lanka and India is that it is a two-way operation (that is goods are smuggled from Sri Lanka to India and vice versa) unlike with some other countries which are just one-way operations. For example, the contraband trade between Sri Lanka and Singapore is primarily a one-way operation that is, goods are smuggled from Singapore to Sri Lanka and not vice versa.

Since the Indo-Sri Lanka contraband trade and unofficial capital transfers are two-way operations, a complete study of this phenomenon should involve field research in both the countries, whereas our fieldwork was undertaken only in Sri Lanka. However, we can safely claim that the Indo-Sri Lanka contraband trade and unofficial capital transfers by and large originates from Sri Lanka. We arrive at this conclusion by looking at the air passenger traffic between the two countries. When we dissected the air passenger traffic it was evident to us that the majority of the passengers travelling from Colombo to various Indian cities were Sri Lankans and the majority of the passengers travelling from various Indian cities to Colombo were also Sri Lankan returnees.

The primary reason for the domination of Sri Lankans in these underworld operations is that Indian economy was a semi-autarkic economy until very recently and even today the non tariff barriers in India are greater and the tariff rates are higher than in Sri Lanka. As a consequence there exists a lucrative market for Sri Lankan and other foreign goods in India. Due to the opening-up of the Sri Lankan economy in 1977 there is an influx of third country goods into Sri Lanka, part of which are then smuggled into India where it fetches very high prices. On top of these there are the traditional contraband items such as spices, coconut products and gold which attracts a lucrative market in India. On the other hand there is a lucrative market for Indian textiles like sarees and sarongs, *inter alia*, in Sri Lanka. These factors are the causes of the preponderance of Sri Lankans in the two-way contraband trade and unofficial capital transfers between the two countries. Therefore our opinion is that the limitation of this study emanating by the fact that the field work was undertaken in Sri Lanka only is a minor one.

The important limitation of our present study is the quantitative estimations which is, by its nature, at best conjectural. However, we have taken great care not to overestimate the phenomenon. Hence all our quantitative estimations are of minimum value. Therefore we believe that the actual magnitude of these underworld transactions would be higher than our estimations provided in this paper. But what we do not know is by how much. This is the most important but unavoidable limitation of this study. However, our conclusions are derived from these minimum values. Therefore, in fact the actual values if ever found would support our conclusions with greater authenticity than at present.

Another limitation of this study is that ideally we would have preferred to undertake an industrywise estimation of the contraband trade between Sri Lanka and India which would have provided tremendous scope for analysing the effects of contraband trade on such industries in both the countries. Due to a variety of reasons we did not venture into such a course of research. Nevertheless we have drawn some information from a recent publication by the Ceylon Textile Manufacturers' Association which attempts to throw some light on the impact of smuggling of sarees and sarongs from India on the local textile industry.

Yet another limitation is in the matter of unofficial capital transfers which takes place in gold and in liquid money. Gold has a dual function in the underworld trade between Sri Lanka and India. That is, gold is used for smuggling as a durable commodity (in small scale) as well as a means of capital transfers (in large scale). It is very difficult or nearly impossible to disentangle the components of commodity trade and capital transfers out of gold smuggling. Therefore, as a matter of convenience we assume gold smuggling as a commodity trade only and consequently capital transfers refer to liquid money transactions by the 'chit system' only. Despite the foregoing limitations, to the best of our knowledge and capability, the qualitative and quantitative informations presented in this paper are reliable.

IV
Official Trade

In this section our purpose is not to undertake a comprehensive study of the official Indo-Sri Lanka trade in historical perspective. Our primary task here is to highlight the basic structures and intricacies of the official Indo-Sri Lanka trade in the recent past (i e, post 1977). We also look at qualitative and quantitative aspects of Indo-Sri Lanka trade, with specific emphasis on constraints on Sri Lankan exports to India, during the last few years.

Commodity Composition and Value

Sri Lankan exports to India overwhelmingly consists of primary products and raw materials. They are, for example, spices, pulses, coconut products, graphite, natural rubber, organic chemicals, metalifers ores and metal scrap, precious and semi-precious stones, artificial resins and plastic materials, pulp and paper products, furnace oil and petroleum products, etc.[1] Occasionally Sri Lanka has been exporting tea to India to ease the supply bottlenecks in India. Hence it is evident that the list of Sri Lankan exports to India is very thin.

Whereas Sri Lankan imports from India consists a wide range of goods, bulk of which are manufactured, semi-manufactured and intermediate goods. Thus the Sri Lankan imports from India consists of spices, oil meals, fruits and vegetables, processed fruits and juices, marine products, raw cotton, leather and manufactures, drugs, pharmaceuticals, fine chemicals, dyes, intermediaries and coal tar chemicals, inorganic and organic agro chemicals, cosmetics and toiletries, rubber manufactured products, glass, glassware, ceramics and cement, paper wood products, plastic and linoleum products, residual chemical and allied products, manufactures of metals, machinery and instruments, transport equipment (buses, two-wheelers, three-wheelers, etc), iron and steel bar/rod, etc, primary and semi finished steel, cotton yarn fabrics/made up, etc, and man-made yarn fabrics/made ups, etc.[2]

The commodity composition of Indo-Sri Lanka trade reflects the diversified nature of the Indian economy. This may not be surprising given the huge natural and human capital endowments of India.

Sri Lankan exports to India is only about 0.6 per cent of the total Sri Lankan exports. On the other hand Sri Lankan imports from India is about 8.2 per cent of the total Sri Lankan imports.[3] Indian exports to Sri Lanka is only about 0.99 per cent of the total Indian exports. On the other hand Indian imports from Sri Lanka is only about 0.07 per cent of the total Indian imports.[4] These percentages in a nutshell provide an indication of the values of the two-way trade between the two countries.

The last 10-year values of imports from India (by Sri Lanka) are as follows: 1982—Rs 1,520 million, 1983—Rs 2,709.3 million, 1984—Rs 2,833.6 million, 1985—Rs 2,027.9 million, 1986—Rs 2,221.9 million, 1987—Rs 2,159.8 million, 1988—Rs 2,893.5 million, 1989—Rs 2,312.6 million, 1990—Rs 4,730.7 million, 1991—Rs 9,105.3 million, 1992 (month of January only)—Rs 999.4 million.[5] The last 10-year values of exports to India (by Sri Lanka) are as follows: 1982—Rs 456.3 million, 1983—Rs 656.4 million, 1984—Rs 328.2 million, 1985—Rs 183.4 million, 1986—Rs 340.5 million 1987—Rs 187.1 million, 1988—Rs 615.1 million, 1989—Rs 326.6 million, 1990—Rs 809.6 million, 1991—Rs 521.7 million, 1992 (month of January only)—Rs 31.9 million.[6]

As can be noticed from the foregoing figures Sri Lanka has been incurring persistent trade

deficit with India in the last 10 years. In fact, Sri Lanka has had continuous trade deficits with India ever since independence, though the rate of growth of the trade deficit has been fluctuating. The total value of Indian exports to Sri Lanka in 1991 has been the largest ever recorded in the entire history of Indo-Sri Lanka trade. The trade deficit of Sri Lanka (with India) in 1991, which was Rs 8,583.6 million, is by far the largest trade deficit ever recorded in the annals of Indo-Sri Lanka trade.[7] India has emerged as the second largest source of Sri Lankan imports accounting for 7.2 per cent and 8.2 per cent of the total Sri Lankan imports in 1991 and January 1992 respectively.[8] (Japan is the largest source of Sri Lankan imports, which in 1991 accounted for 11.7 per cent of the total Sri Lankan imports.)

There are variety of reasons for this rapidly accelerating Sri Lankan imports from India and the very low level of (even decelerating) exports to India. To begin with, this trend in Indo-Sri Lanka trade is in perfect conformity with the overall pattern of Sri Lanka's international trade in the recent past. The pattern of Sri Lanka's international trade market is dichotomised. That is, the bulk of Sri Lanka's exports find a market in the developed western countries (Europe and North America), whereas the bulk of Sri Lanka's imports are from Japan and Asian developing countries. In view of this overall pattern of Sri Lanka's international trade the trade deficit with India is not that surprising. However, the paltry sum of Sri Lankan exports to India is a cause for concern. Now let us analyse some of the reasons for the huge trade deficit with India.

First of all, the primary reasons for the accelerating Sri Lankan imports from India are the proximity of India to Sri Lanka, the attraction of cheaper Indian goods and more recently the depreciation of the Indian rupee. The proximity of India reduces the transportation cost and time for imports. As we have noted earlier bulk of Sri Lanka's imports from India are manufactured and intermediate goods. Since the Sri Lankan economy is undergoing a profound structural change (from a producer and exporter of primary products to a producer and exporter of manufactured/semi-manufactured goods) it requires a lot of intermediate goods, machinery and transport vehicles and equipment.

The resource base of Sri Lanka is negligible in contrast to the resource base of India. Therefore Sri Lanka is compelled to import all its intermediate goods, machinery and transport vehicles and equipment. In this regard no other country is better placed than India to meet Sri Lanka's growing requirements. Because Indian goods are generally cheaper (than developed countries or even south-east Asian countries) and the transportation cost is minimal. More importantly India is able to supply Sri Lanka's demands because the overwhelming majority of Sri Lankan manufacturing industries are low-tech industries (such as garment industry)—that is there are no supply constraints on the part of India. Another important factor is that, Indian machinery, transportation vehicles, etc, are most suited for Sri Lankan conditions. Due to these reasons Indian goods are generally much cheaper and most appropriate to Sri Lankan needs than goods from the developed countries.

Yet another primary reason for the accelerating Sri Lankan imports from India is the depreciation of the Indian rupee in mid-1991. The quantum leap from Rs 4,730.7 million worth of imports from India in 1990 to Rs 9,105.3 million in 1991 and Rs 999.4 million in January 1992 stands testimony to the effect of depreciation of the Indian rupee and the consequent cheaper value of Indian goods to Sri Lankan importers.

Now let us analyse some of the reasons for the low level of Sri Lankan exports to India which is even declining in absolute values in recent years. As we have noted earlier Sri Lankan exports to India are overwhelmingly primary products and raw materials.

It is very unfortunate that Sri Lanka is yet to discover (produce) something which is in great demand in India. Since the resource base of Sri Lanka is very low it is at a disadvantage in meeting the needs of the Indian market. The bulk of the goods which Sri Lanka could supply to India is available in India itself. For example, India is the second largest producer of coconuts although it is an importer of coconuts as well. Rubber and spices are the other Sri Lankan export commodities to India which are available in India too. In this circumstance the traditional exports of Sri Lanka only complements India's own production. For example, whenever there is a shortfall in tea production in India, Sri Lanka meets such casual demand. Therefore there is no steady market for Sri Lanka's traditional exports (rubber, coconut, spices, etc) to India. This lack of a long-term market is a cause of low Sri Lankan exports to India.

Moreover there are supply constraints on Sri Lanka's traditional exports to India. At times Sri Lanka finds difficult to meet the entire demand of India for certain goods. One such example is the rice-rubber bilateral trade agreement between Sri Lanka and China which has restricted the quantity of rubber that Sri Lanka can make available to India. Further, with regard to some traditional Sri Lankan exports it is said that Sri Lankan prices are high (in comparison to other international competitors) and of poor quality. One such example is spices. Due to these reasons India prefers to import rubber from Malaysia and spices from Madagascar. This has greatly contributed to the declining value of Sri Lankan exports to India.

It has also to be pointed out that the non-tariff barriers in India for Sri Lankan traditional exports to that country has severely hampered Sri Lankan exports. These non-tariff barriers are a hindrance on top of the high tariff rates in India. The export of cloves, for example, is badly affected by the non-tariff barrier. However, it has to be remembered that even if India lifts the non-tariff barrier Sri Lanka may not be able to compete with other spices producing countries to enter the Indian market, due to higher prices of Sri Lankan produce.

The foregoing passages explain the reasons for the low level of Sri Lankan exports to India which is also declining in absolute values. Therefore, the entire strategy of dependence on primary and raw-material exports to India has to be reconsidered.

There is a big hue and cry about the huge trade deficit with India. There is nothing sinister about Sri Lanka's huge trade deficit with India. Both Sri Lanka and India are signatories to the GATT and the international trade between the two countries are bound by the same. There are hardly any malpractice involved in the conduct of the official trade between the two countries.

Historically, when allowed to market forces, India has been one of the largest source of Sri Lanka's imports. During the British colonial rule in south Asia, India was the largest source of Sri Lanka's imports. However, in the post-independence period due to government interventions the dependence on Indian imports was artificially curtailed. After the liberalisation of the Sri Lankan economy in 1977 India again emerged as one of the largest source of Sri Lankan imports. India was the second largest source of Sri Lankan imports during many years between the period 1977-1992.

On the other hand, historically, Sri Lankan exports to India has been dismal barring the time of the second world war when India absorbed about half of Sri Lanka's total exports. In the entire history of Indo-Sri Lanka trade the largest ever value of Sri Lankan exports to India has been Rs 809.8 million in 1990 which was an exception.[9] In the post-1977 period during very few years did Sri Lanka export to the value of Rs 500 million or over to India. Mostly, during this period, Sri Lanka's exports to India has been very well below Rs 500 million.[10]

Therefore, devoid of government interventions and when left to the free play of market forces India has had a competitive edge and comparative advantage over her competitors in supplying the needs of the Sri Lankan market. In our view the huge trade deficit with India is no cause for alarm. Any two trading partners, when left to market forces, engage in international trade according to the economic principle of comparative

advantage. If the Sri Lankan market feels that India commands a comparative advantage over other international competitors it is advantageous for Sri Lanka to import from India which should not be corrected by government action.

Every trading country has deficits and surpluses in its balance-of-trade with different countries. No country on earth has a deficit with each and every trading partner. Likewise no country has a surplus with each and every trading partner. Every trading country has deficits with some trading partners and surpluses with some others. Therefore there is no need for alarm if a country incurs a huge trade deficit with one of its trading partners.

Many countries in the world, developed as well as developing have trade deficits with individual countries and/or their entire balance of trade could be in deficit. Sri Lanka is not an exception to this rule. For example, Sri Lanka has had a huge trade deficit in its entire international trade (not just with India) ever since 1977. Sri Lanka had an overall trade deficit of $ 719 million in 1990. Likewise, for example, India had an overall trade deficit of $ 7,848 million in 1990, the UK had an overall trade deficit of $ 45,311 million in 1989 and the US had an overall trade deficit of $ 1,44,564 million in 1989 [Foreign Trade Statistics 1991]. Although the overall trade balance of Sri Lanka, India, UK and the US have had deficits if we look at their performance with different individual trading partners it will become evident that they would have incurred some deficits and some surpluses. The majority of the countries in the world do incur deficits in international trade. Some of course do manage to accumulate surpluses like Japan, Taiwan, South Korea, etc.[11]

Hence, there is no need for over-concern about the huge trade deficit with India. India has a trade surplus with Sri Lanka and some other trading partners but it has also huge trade deficits with many other trading partners. The same is true with Sri Lanka's international trade. Sri Lanka has a huge trade deficit with India and some other trading partners but at the same time has comfortable surpluses with some others. For example, Sri Lanka has trade surpluses with Bangladesh and the Maldive Islands in south Asia and more interestingly with the US and Germany. While Sri Lanka's trade surpluses with Bangladesh and Maldive Islands are small in value, Sri Lanka's trade surplus with the US is a staggering Rs 15,906.7 million in 1991 and with Germany a moderate Rs 1,942.3 million in 1991.[12] It has also to be noted that Sri Lanka has had trade surpluses with the US and Germany during most of the years between 1977 and 1992.[13] Moreover, it may be interesting to note that Sri Lanka's trade balance with the entire industrialised countries (taken together) has also been in surplus, continuously since 1989.[14]

The trade deficit with India is being overplayed by many in Sri Lanka not due to any sound economic principle or rationale rather due to political antagonism. Our argument is that, just because Sri Lanka has accumulated huge trade surpluses with the US or Germany or with the entire industrialised countries (taken together) does not imply that the Sri Lankan economy is stronger than or superior to the economies of those countries. It does not imply that Sri Lanka is politically stronger than those countries either. On the same line of argument, just because Sri Lanka runs a huge trade deficit with India does not necessarily imply that the Sri Lankan economy is weaker than or inferior to that of the Indian economy or even politically so.

The Sri Lankan economy has come of age. Sri Lanka is no more a mere supplier of tea, rubber and coconut to the rest of the world. Sri Lanka today is also a supplier of garments and housemaids to the rest of the world. This may not be a particularly sound transformation. Nevertheless, the important fact to note is that Sri Lanka has begun to diversify her economy, unshackling from the bondage of century old plantation economy, which is a positive development.

Sri Lanka is capable of competing in the world market including the Indian market. Since India is opening her economy there is a tremendous scope for Sri Lanka to increase her exports to the country. But this cannot be achieved by relying solely on exports of primary products and raw material. Sri Lanka has to diversify her exports to India with much greater emphasis on the exports of manufactured, semi-manufactured and processed goods. The best way to penetrate into the huge Indian market is to invite Indian industrialists to establish joint-ventures here with buy-back arrangements. That is, for example, Indian industrialists could establish a tyre manufacturing plant in Sri Lanka using local natural rubber and export the end product to India. In this way, instead of exporting raw rubber to India, Sri Lanka could export manufactured rubber products to India. Likewise many such joint-ventures could be identified with buy-back arrangements. With the gradual opening up of the huge Indian market there will be a huge pent-up demand for consumer goods in India. Sri Lanka should strive to meet such demand as much as possible. Sri Lankan goods will be cheaper for India than imports from elsewhere.

At the outset of this section we primarily set out to explore the reasons for the dismal value of exports to India and the consequent huge trade deficit with India. We have identified a number of reasons in the foregoing pages. However the overwhelming factor contributing to the paltry sum of Sri Lankan exports to India is the contraband trade between the two countries. Therefore we have undertaken a specific study on the contraband trade and unofficial capital transfers between Sri Lanka and India in the forthcoming section.

V
Contraband Trade and Unofficial Capital Transfers

Our concern for the purpose of this paper is the period between 1977 and 1992. The contraband trade between Sri Lanka and India is not a secret. Everybody know about it. However, what they do not know is the actual magnitude of such trade. Further, it is not that contraband trade takes place only between Sri Lanka and India. Contraband trade takes place between Sri Lanka and many other countries (e g, with Singapore).

However the contraband trade between Sri Lanka and India has certain uniqueness. They are as follows: Firstly, the contraband trade between Sri Lanka and India is a two-way operation. That is, goods are smuggled from Sri Lanka to India and vice versa. The value of such trade in both directions seem to be only fractionally different (unlike the official trade gap which is enormous). In contrast, the contraband trade between Sri Lanka and almost all other countries are one-way operations overwhelmingly goods are smuggled from abroad to Sri Lanka and not vice versa. Secondly, the total two-way contraband trade (in monetary value) between Sri Lanka and India is greater than the total two-way official trade between them. This is a unique situation *vis-a-vis* the contraband trade between Sri Lanka and other countries. Thirdly, we also strongly suspect that the total amount of two-way contraband trade between Sri Lanka and India is by far the largest contraband trade between Sri Lanka and any single country. However, we do not have clear evidence for such a suspicion.

The contraband trade between Sri Lanka and India has accelerated since 1977, due to the liberalisation of the Sri Lankan economy and the growing ethnic unrest in Sri Lanka. In the pre-1977 period traditional goods like spices, coconut products and gold were smuggled from Sri Lanka to India and sarees, sarongs, stainless steel products and fancy items were smuggled from India to Sri Lanka. Due to the liberalisation of the Sri Lankan economy in 1977 many goods were imported (from third countries) to Sri Lanka and then smuggled into India where they fetched exorbitant prices because of the banning of imports of such goods or very high import duties running up to 300 per cent of the value of good. These non-traditional goods (mainly consumer durables) provided great stimulus to the contraband trade between Sri Lanka and India, particularly from Sri Lanka to India. When there was a duty-free shop in Colombo from early 1980s to late 1980s there was a surge in the number of Indians coming to Sri Lanka purely for smuggling purposes. Although India also has begun to gradually liberalise her economy in recent

years, the non-tariff barriers are greater and tariff rates are still higher in India than in Sri Lanka. Therefore, there is not much abating in the smuggling of such non-traditional goods from Sri Lanka to India even today. Even if the tariff rates are equalised and non-tariff barriers are completely lifted contraband trade will continue to take place in traditional goods.

Another crucial factor that contributed to the acceleration of the contraband trade between the two countries since 1977 is the ethnic unrest in Sri Lanka. The successive racial riots in 1977, 1981 and 1983 had immensely contributed to the growing contraband trade and unofficial capital transfers between the two countries. These successive racial riots within short time spans has precipitated great insecurity, vulnerability and uncertainty among a large number of businesses (traders and industrialists) in Sri Lanka. A substantial number of them fled to India and established business enterprises and industries in the immediate aftermath of the 1983 racial riots. Bulk of them did not completely sever their business ties with Sri Lanka and most of them have hence returned to Sri Lanka in the late 1980s onwards. However, the uncertainty and insecurity still prevails and therefore many businesses are keeping one leg in India and another in Sri Lanka. The persisting uncertainty and insecurity since 1983 has revived and re-established the historical commercial ties between the two countries (legal and illegal). The revival of the old mercantilist era has been greatly facilitated by the exodus of refugees (over two hundred thousand) to India in the aftermath of the 1977, 1981 and 1983 racial riots in Sri Lanka.

The fleeing of large number of Sri Lankans to India during the late 1970s and throughout the 1980s (during the anti-Indian riots in the late 1980s as well) has accelerated the contraband trade and unofficial capital transfers between the two countries to unprecedented levels. We have two clear evidence for our claim. One is the number of air flights to and from India in the post-1983 period has increased enormously thus indicating a much greater air passenger traffic between the two countries. During the early 1980s there were only a handful of weekly flights to and from India. But at present (late 1992/early 1993) there are 29 flights a week (Air Lanka-20 and Indian Airlines-nine) to different cities in India and the same amount from India. About 40 per cent of the total air passenger traffic to and from India are contraband traders either on their own right or are couriers for organised contraband syndicates. The second evidence is that historically the official exchange rate of the Indian rupee has been lower than the unofficial (black money market) exchange rate. Ironically in the post-1983 period the official exchange rate of the Indian rupee has been higher than the unofficial exchange rate. It is the same story in the Indian side as well. What it indicates is that there is a greater supply and demand for transferring money (capital) to and from India through unofficial channels, which is called the 'chit system'.

Our present study of the modalities and extent of the parallel trade and unofficial capital transfers between Sri Lanka and India is concerned with only the regular and organised contraband traders and not occasional or one-off contraband traders. Further, we are not here concerned with contraband trade in narcotic drugs between the two countries which is one of the largest growth industries. Moreover, we are also not here concerned with the war-induced contraband trade between the northern and eastern provinces of the Island and India. This war-induced contraband trade comprises smuggling of arms and ammunitions, fuel and other consumer goods which are banned from entering the northern province from rest of the Island. We have left out the narcotic drugs from our purview because it has not got much relevance to our purpose of this study. We have left out the war-induced contraband trade from our purview because it may not be a permanent feature(?). However, we have included the traditional contraband trade between India and the northern and eastern provinces of the Island, which takes place even today under the conditions of war.

Contraband Trade by Air and Sea

Presently almost 95 per cent of the travellers to and from India travel by air (since the suspension of the ferry service between Talaimannar and Rameswaram). The most common goods that are smuggled by air are as follows: from Sri Lanka to India—gold, silver, precious stones, cinnamon, cardamom, cloves, imported audio cassette recorders, imported video cassette recorders, other imported electrical goods, imported textiles, etc, and from India to Sri Lanka—sarees, sarongs and other Indian textiles, stainless steel products, medicinal drugs and miscellaneous fancy goods.

The Air Lanka flies 20 times a week to various Indian cities (eight times to Madras, six times to Thiruvananthapuram three times to Tiruchy and three times to Bombay). The Indian Airlines flies nine times a week to two Indian cities (seven times to Madras and twice to Thiruvananthapuram). The average number of passengers carried by Air Lanka is 2,153 per week which is 1,11,956 per year. The average number of passengers carried by Indian Airlines is 1,260 per week which is 65,520 per year. Therefore, the total number of passengers travelling by air to India (from Sri Lanka) annually is 1,77,476.[15] Out of this total number of air passengers about 40 per cent are contraband traders.[16] Therefore, annually there are 70,990 contraband traders travelling from Sri Lanka to India by air. Every one of them carry at least Rs 50,000 worth of contraband.[17] So this gives an annual sum of Rs 3,549.50 million worth of contraband trade from Sri Lanka to India by air.

Likewise we can assess the contraband trade from India to Sri Lanka by air. The total number of flights by both airlines are the same. The Air Lanka on the average carries 1,979 passengers per week from various Indian cities to Sri Lanka, which comes to a total of 1,02,908 a year. The Indian Airlines carries 900 passengers per week from India to Sri Lanka, which comes to a total of 46,800 a year. Therefore, the total number of passengers travelling from India to Sri Lanka annually by air comes to around 1,49,708.[18] Out of this total, again around 40 per cent are contraband traders.[19] Hence, annually there are 59,883 contraband traders travelling from India to Sri Lanka. Everyone of them carry at least Rs 50,000 worth of contraband.[20] So this gives an annual sum of Rs 2,994.15 million worth of contraband trade from India to Sri Lanka by air. Therefore, the annual two-way contraband trade between Sri Lanka and India by air runs into Rs 6,543.65 million.

This is the oldest route of commercial interaction between Sri Lanka and India. Not only there were movements of goods, services and capital between the two countries by sea (legal and illegal) but even labour from time immemorial. We are not concerned here with the passenger traffic by ships. However, after the suspension of the ferry service between Talaimannar and Rameswaram in the mid-1980s, there is hardly any passenger traffic by ships between Sri Lanka and India. But there are regular boats plying between Sri Lanka and India (both ways) purely for contraband trade purposes. This is our concern here.

The contraband trade by sea takes place from several coastal areas of the island. Practically from Galle (in the southern province) through the south-western coast to western coast, north-western coast, northern coast, north-eastern coast and up to Trincomalee, the entire coastal areas are used for contraband trade with India. Some of the most notable coastal towns engaged in contraband trade with India are Beruwala, Kalutara, Colombo, Wattala, Negambo, Puttalam, Kalpitiya, Mannar, Valvettiturai, Point Pedro and Mullaitevu. These wide-spread coastal areas used for contraband trade with India signifies the variety of communities involved in such activity. On the Indian side, the coastal areas of Tamil Nadu and Kerala states are widely used for contraband trade with Sri Lanka.

The most common goods smuggled by boats to and from India is almost the same as by air. However, there are differences in the quantity of certain goods by both means. For example, gold and silver smuggled from

Sri Lanka to India by air is in small quantities. But gold and silver are smuggled in large quantities by sea from Sri Lanka to India because the smuggling of these high value goods is less riskier by sea. Likewise, bulky items like electrical goods are also smuggled by sea in greater quantities. The smuggling of sarees, sarongs and other textiles from India to Sri Lanka are also in massive quantities by sea where detection is much less.

According to our survey, on average about eight boats of contraband trade takes place from Sri Lanka to India and vice versa every day of the year.[21] These contraband boats originate from different coastal towns of the island to different parts of Tamil Nadu and Kerala and vice versa. These are two-way operations. That is, on average eight boats ply from Sri Lanka to India and eight boats ply from India to Sri Lanka.[22]

Our estimates show that on average in each such boat Rs 5,00,000 worth of goods are smuggled from Sri Lanka to India.[23] This gives a daily total of Rs 4 million contraband trade from Sri Lanka to India by sea, which is Rs 1,456 million a year. But our estimates of contraband trade by sea from India to Sri Lanka reveals that each boat carries on average Rs 10,00,000 worth of goods.[24] Thus the daily total of contraband from India to Sri Lanka by sea is Rs 8 million, which is Rs 2,912 million a year. Therefore, the total two-way contraband trade by sea is about Rs 4,368 million per annum.

Now if we add the total two-way contraband trade by air and sea it comes to around Rs 10,911.65 million. That is, the total contraband trade by air and sea from Sri Lanka to India is Rs 5,005.50 million and the total contraband trade by air and sea from India to Sri Lanka is Rs 5,906.15 million per annum. That is, the total contraband trade between Sri Lanka and India, which is Rs 10,911.65 million, is greater than the total official trade between the two countries, which was Rs 9,627 million in 1991.[25]

Unofficial Capital Transfers

The capital transfers between India and Sri Lanka through unofficial (illegal) channels far exceeds through official channels. Although we have been unable to obtain the precise amount of official capital transfers between the two countries (both ways, but overwhelmingly from India to Sri Lanka), by assessing the unofficial capital transfers between the two countries we arrive at the inevitable conclusion that the unofficial capital transfers far exceed the official capital transfers.

Unofficial capital transfers from Sri Lanka to India takes place by two means. One is by the smuggling of high value precious metals like gold and silver (and to a lesser extent by precious stones like gems) and other is by liquid money through the 'chit system'. Whereas unofficial capital transfers from India to Sri Lanka takes place only through the 'chit system'. As we have already mentioned earlier, the smuggling of gold, silver and precious stones have a dual function—that is, they function as a means of capital transfer as well as commodity smuggling, capital transfers by the smuggling of gold, silver and precious stones takes place in bulk quantities and mainly by sea due to the greater risk involved by air. During our period of study (1977-1992), the only time huge unofficial capital transfers from Sri Lanka to India by means of smuggling huge quantities of gold by air took place is in the immediate aftermath of the 1983 racial riots in Sri Lanka. Normally it is undertaken by sea. Due to the dual function of the smuggling of gold, silver and precious stones it is very difficult to disentangle the unofficial capital transfer portion from the commodity smuggling portion. Therefore, as a matter of convenience, we have lumped the entire smuggling of gold, silver and precious stones from Sri Lanka to India under commodity smuggling. Therefore, our present assessment of the unofficial capital transfers incorporates only the liquid money transfers through the 'chit system'.

Now let us outline the 'chit system'. When people travel to India (for whatever purpose), due to foreign exchange control only a limited amount of foreign exchange (currently (late-1992) $ 800 per adult per annum, which was only $ 200 until recently) is officially sanctioned for their expenses.[26] For many travellers this official allowance is inadequate. Further many travellers to India travel more than once a year. Therefore they resort to purchasing Indian rupees in the black money market in Colombo and elsewhere. The uniqueness of purchasing Indian rupees in the black money market in Sri Lanka is that the travellers do not get the Indian rupees in hand in Sri Lanka itself. Instead they pay the equivalent of Sri Lankan rupees (in accordance with the black money market exchange rate) here and they are given a 'chit' (which is analogous to a cash cheque under modern banking system) by the production of which they obtain Indian rupees in India. The same system operates when Indian passengers travel from India to Sri Lanka—that is they hand over Indian rupees and obtain a 'chit' on the Indian side and by handing over the 'chit' in Sri Lanka (mostly in Colombo) they obtain Sri Lankan rupees. There is a huge network of moneylenders in both the countries who function as an unofficial capital market.

This curious way of transferring money from India to Sri Lanka and vice versa is called the 'chit system'. This is not a new phenomenon in Indo-Sri Lanka economic relations, which is being conducted since the old mercantilist era. As we have mentioned earlier, businesses in Sri Lanka has businesses in India as well. The transfer of capital from both ends to the other end almost exclusively takes place through the 'chit system' because the transfer of capital from India to Sri Lanka and vice versa through official channels is heavily restricted and regulated. Hence there is a natural tendency to transfer resources through unofficial channels. This is a natural breeding ground for the 'chit system'. These unofficial capital transfers have greatly increased in the post-1983 period due to political unrest in Sri Lanka.

Now let us do an estimation of the unofficial capital transfers by air and sea to and from India. The average number of annual air passengers from Sri Lanka to India is 1,77,476. At least around 50 per cent of them use the 'chit system' to obtain Indian currency.[27] Therefore, the absolute number of passengers using the 'chit system' (from Sri Lanka to India) is 88,738. Further, on average every passenger availing of the 'chit system' takes Rs 10,000 worth of Indian currency.[28] Therefore, the total amount of capital transferred from India to Sri Lanka annually is Rs 887.38 million through the 'chit system' used by Sri Lankans travelling to India.

Likewise the average number of annual air passengers from India to Sri Lanka is 1,49,708. Again at least about 50 per cent of them use the 'chit system' to obtain Sri Lankan currency, which in absolute amount is 74,854.[29] On average every passenger availing of the 'chit system' takes Rs 10,000 worth of Sri Lankan currency.[30] Therefore the total amount of capital transferred from Sri Lanka to India annually is Rs 748.54 million through the 'chit system' used by Indians travelling to Sri Lanka. Thus the total two-way capital transfers between Sri Lanka and India by air is around Rs 1,635.92 million per year.

Further, as we have already observed, the value of goods smuggled by sea from India to Sri Lanka (one million per boat) is greater than from Sri Lanka to India (half a million per boat). Therefore, the difference of half a million per boat from India to Sri Lanka is met by the 'chit system'. That is, Rs 4 million capital (Rs 5,00,000 x 8 boats) per day is transferred from India to Sri Lanka by sea, which gives an annual total of Rs 1,456.0 million. Capital transfers by sea is only a one-way operation.

Therefore the total amount of two-way unofficial capital transfers by air and sea comes to around Rs 3,091.92 million, which (to best of our knowledge) far exceeds the official capital transfers between the two countries. Historically, the black money market exchange rate for Indian rupee in Sri Lanka has been higher than the official exchange rate. However, from late 1980s onwards it has been the reverse. That is, the black money market exchange rate for Indian rupee is lower than the official exchange rate (approximately Rs 1.40 against Rs 1.70 in late 1992), which is the same case on the Indian side as well. Apparently there are three reasons for this

unusual phenomenon in the annals of Indo-Sri Lankan economic relations.

First and foremostly it indicates that there is greater transfer of capital from and to India, through unofficial channels, which has brought down the unofficial exchange rate *vis-a-vis* the official rate. Secondly, since India has liberalised gold imports recently and due to the slack in the world market price of gold the capital transfers undertaken through the smuggling of gold has decreased, which in turn has increased the demand for and supply of the 'chit system', the ultimate result of which is the lowering of the unofficial exchange rate. Thirdly, when the Indian rupee depreciated in 1991 Sri Lanka did not adjust her exchange rate for Indian rupee accordingly, for reasons best known to the Central Bank of Sri Lanka. The exchange rate of Indian and Sri Lankan rupees is determined by the dollar rates of the respective currencies. The present (late 1992) dollar rate in Sri Lanka is around Rs 44 and in India it is around Rs 28 (Indian rupees). Therefore, the exchange rate of Indian rupee in Sri Lanka should work out to be 1.57. But the official rate is around 1.70. This partly explains the lower exchange rate at the black money market.

The contraband trade to and from India by sea has enormously increased in southern, south-western, western and north-western coastal areas during our period of study (1977-1992). New customs posts were established in Negambo, Kalpitiya and Beruwala in recent times. The spread of sea routes for contraband trade to and from India is yet another indication of a surge in contraband trade between the two countries. The overwhelming majority of the contraband trade by sea from and to Sri Lanka is to and from India. Occasionally contraband trade with some other countries also take place by sea.

Officially gold cannot be exported from Sri Lanka and the import of gold into Sri Lanka is also restricted. Due to increasing illegal gold imports into Sri Lanka in recent years the Central Bank of Sri Lanka further liberalised gold imports a few weeks ago (late 1992). Both gold and silver are illegally imported from Singapore (where they are cheaper compared to the price in Sri Lanka) and then smuggled into India where they find a lucrative market. However, it has to be pointed out that gold smuggling to India in recent months (late 1992) has been slack due to the following reasons: (a) liberalisation of gold imports into India in April 1992—accordingly, Indians could take up to five kg of gold into India with the payment of a nominal import duty, which has depressed the price of gold in India; (b) a general slack in the world market price of gold. As a consequence of these factors the profit margin in gold smuggling has declined recently. However, silver has replaced gold as a favourite contraband to India in recent months. The profit margin on silver is said to be enormous.

We would like to again remind that all our estimations in this section are based on undetected successful contraband trade operations. Even the detection/apprehension of contraband trade either at sea or airports in Sri Lanka are by and large due to tip offs. The rivalries between various contraband trade syndicates is the primary source of detection/apprehension of contraband trade.

The market for Indian textiles in general and for sarees and sarongs in particular in Sri Lanka is a massive one. This is due to the high quality and low prices (compared to imported textiles from third countries and even local products) of Indian sarees and sarongs and the compatibility of the cultural tastes of the two countries for such items. The major good that is smuggled from India to Sri Lanka by air as well as by sea is textiles, particularly sarees and sarongs. This illegal textile trade runs into millions of rupees annually.[11]

Now let us summarise the major findings of our assessment of contraband trade and unofficial capital transfers between Sri Lanka and India.

(i) The illegal exports of goods from Sri Lanka to India is nearly 10 times greater than the official bona fide exports (Rs 5,000.50 million compared to Rs 521.73 million of official exports in 1991).

(ii) The total two-way contraband trade (exports + imports) between Sri Lanka and India is greater than the total two-way official trade between the two countries (Rs 10,911.65 million compared to Rs 9,627.0 million of official trade in 1991).

(iii) Sri Lanka's trade gap with India in contraband trade is very much lesser than the official trade gap. The official trade gap is almost 10 times higher than the contraband trade gap (Rs -8,583.59 million in official trade in 1991 compared to Rs -900.65 million in contraband trade).

(iv) The unofficial capital transfers to and from India is far greater than the official capital transfers between the two countries.

(v) Sri Lanka's contraband trade with India is the largest with any one country. Finally, we shall outline. (a) The gains and losses accruing from the contraband trade and unofficial capital transfers between the two countries. (b) The gainers and losers due to the contraband trade and unofficial capital transfers between the two countries.

The losses incurred by these illegal activities are (i) the loss of hard currency to Sri Lanka and India because the official trade and official capital transfers are conducted in hard currency whereas the contraband trade and unofficial capital transfers are conducted in respective local currencies. (ii) The loss of export and import duties to the respective governments, overwhelmingly import duties.

The gains are (i) The market prices of contraband goods are lower than the existing market prices for those goods in their respective markets, thus depressing the overall price level which benefits the consumers. (ii) The producers get access to an enormous market which are denied to them by non-tariff barriers and high tariff rates.

Among gainers and losers—consumers are gainers because the prices are depressed due to contraband trade and unofficial capital transfers. The contraband traders are also gainers who could not have survived under non-tariff barriers and high tariff rates. Moreover the producers are also gainers in that they are able to gain access to a huge market, which is denied through official channels of trade due to non-tariff barriers and high tariff rates. Of course some producers (local) may not be able to wither the competition precipitated by the influx of contraband. One such industry in Sri Lanka is the textiles industry which is struggling to compete with the high quality, low price Indian textile products which are regularly smuggled into Sri Lanka in huge quantities.[12] This is a natural process of a liberalising economy whereby some local industries survive and some struggle. There are some Indian industries also struggling to survive due to the influx of smuggled Sri Lankan goods as well as third country goods from Sri Lanka. So at both the ends there are gainers and losers. Markets function according to supply and demand and not according to the origin of goods or the means of origin.

If there is only a small-scale contraband trade and unofficial capital transfers the losses incurred by the government may not be significant. However, when there is a massive scale of contraband trade and unofficial capital transfers such as between Sri Lanka and India there is a substantial loss to the governments of the trading partners by way of hard currency and import duties. Therefore the causes of such illegal trade and capital movements have to be identified and eradicated. The causes of such illegal activities between Sri Lanka and India are the tariff and non-tariff barriers to trade and severe restrictions on capital movements. Therefore, both the trading partners will overall benefit (despite isolated losses expected in certain industries at both ends) by pulling down the tariff and non-tariff barriers to trade and restrictions on the free movement of capital.

VI

Proposal for Free Trade

Contraband trade has been legalised in many countries by the lifting of tariff and non-tariff barriers to trade, that is by espousing free trade. Even the legalisation of narcotic drugs is actively in the domain of public debate in many countries as the only sensible way of

the effects of the same. Having undertaken an assessment of the contraband trade and unofficial capital transfers between Sri Lanka and India we arrive at the inevitable conclusion of proposing free trade between the two countries—the free movement of goods, services and capital. That is, lifting of all non-tariff barriers and abolishing tariffs on goods and services and the lifting of all restrictions and regulations on capital transfers between the two countries.

The two-way contraband trade and unofficial capital transfers between Sri Lanka and India is of enormous magnitude. Hence the losses incurred by both the governments are significant. It is a futile exercise to erect tariff and non-tariff barriers under these circumstances. Our proposal for free trade is derived from probing the economic reality and economic rationality of the Indo-Sri Lanka economic relations. It is not an abstraction from a high theory. On the contrary, our proposal is a natural outgrowth of an objective and concrete study in inter-state economic relations.

Free trade will benefit both the countries spurring innovations, raising productivity and above all lowering prices. Free trade will lead to rationalisation and specialisation in allocation of resources (investments), production and distribution in both countries. However, in a relative sense, Sri Lanka will be the major beneficiary under a free trade arrangement with India. Because the tariff rates are higher and non-tariff barriers are greater in India than in Sri Lanka at present. Moreover, the Indian market is huge in contrast to the Sri Lankan market. Hence the Sri Lankan producers would have access to a much larger market than Indian producers. Thus, the complete lifting of tariff and non-tariff barriers in both the countries would undoubtedly stimulate more Sri Lankan exports to India than vice versa. The free movement of goods, services and capital between Sri Lanka and India will increase employment opportunities in Sri Lanka, because many Indian manufacturing plants will move into Sri Lanka as labour in Sri Lanka is cheaper and the trade unions are less obstructive.

When the trade between Sri Lanka and India is freed the Sri Lankan and Indian governments would lose the revenue accruing from import duties and a negligible amount of export duties. However, these losses could be more than offset by reducing the number of personnel at the customs departments of both the countries and by the increase in revenue accruing from business turnover taxes due to the expected surge in the two-way trade. Having assessed the enormous contraband trade with India we are compelled to arrive at the inevitable conclusion that Sri Lanka's guardians of international trade, namely, the customs department, do not provide value for money. For example, the import duties accruing to Sri Lanka from the import of goods from India was only around Rs 1,744 million in 1991.[33] The expected loss of this revenue could be easily recouped by slashing the number of personnel at the Sri Lanka customs department and by the increase in revenue accruing from business turnover taxes due to the expected surge in the two-way trade.

Under a free trade regime, on the whole, both countries would enormously benefit. Undoubtedly, there will be losers and gainers. But gainers will be far greater than losers on both sides. As far as Sri Lanka is concerned there will be some industries which may not be able to wither the competition from Indian products. One such prospective industry would be the indigenous Sri Lankan textile industry (not the export garment industry). The Indian textiles are of superior quality and cheaper than the Sri Lankan counterparts. The primary reason for this is that the Indian textile industry has backward linkages (that is raw materials and machinery are produced in India itself) whereas the Sri Lankan counterparts lack such backward linkages. However, backward linkage is not a necessary condition for the growth of an industry. Although the indigenous Sri Lankan textile products (e g, sarees and sarongs) are unable to compete with the Indian textile products at present (only partly due to contraband from India) Sri Lanka is competing well in the western country markets for ready-made garments, which industry is devoid of backward linkages.

Under the principles of free market economy there could be no perfect equilibrium, whether it be in internal trade or international trade. There will be gains and losses in the market place. Some industries would survive and some would perish. Every country should produce and exchange according to its comparative advantage. The Sri Lankan textile industry may not be able to compete well with the Indian textile industry but they do compete well with the textile industries of the western countries. Therefore, Sri Lankan textile industry may lose out in the domestic market to Indian products but these losses will be offset by gains in the international markets.

Our message is that when we talk of the effects of free trade we should not confine our analysis to a particular industry. We have to take into account the overall effects and arrive at a rational decision. One of the beneficial effects of free trade to Sri Lanka will be the opening up of the huge Indian tea market for Sri Lanka. Likewise many Indian industries would also benefit by the complete opening up of the Sri Lankan market. Many such individual examples could be cited. However, it is beyond the purview of this paper to go into industrywise effects of free trade between Sri Lanka and India.

In general we would argue that producers and consumers in both countries would enormously benefit under a free trade regime due to specialisation in production. It may be the traders (middlemen/women) who would be negatively affected due to intense competition because at present the bona fide exporters and importers to and from India are very much lesser than the contraband traders. The contraband trade between the two countries is highly monopolised by a few contraband syndicates. It is these contraband traders who are likely to lose their superprofits under a free trade regime. Naturally they will be the ardent opponents of the proposal for free trade. Free trade could be a powerful tool to break such monopolies of Indo-Sri Lanka trade and unearth their accumulation. Under a protected market (even if it is only partial) only the bona fide exporters and importers are negatively affected because the dishonest always finds a way to get around the tariff and non-tarrif barriers.

Some critics may argue that under a free trade regime Indian goods would flood the Sri Lankan market. Our response is that even now under a partially protected market imports from India is the second largest out of Sri Lanka's total imports and the huge trade gap is precisely due to partial protection. Sri Lanka's exports to India is paltry precisely due to such partial protection on the Indian side. The most sustainable way to narrow the huge trade gap, if not to achieve a trade surplus with India, is to completely free the trade between the two countries. The only way to narrow the gap is by increasing our exports to India and not by artificially (through government intervention) decreasing imports from India. The increase in exports to India in a sustainable way could only be achieved by freeing the trade between the two countries.

We also propose that the only way to effectively combat unofficial capital transfers between the two countries is to make the respective currencies freely convertible. These freely convertible currencies would not only arrest the unofficial capital transfers but would also provide a great stimulus to trade in goods and services (like tourism) between Sri Lanka and India. The busting of the unofficial capital market would also unearth the huge usury capital which could be used for more productive purposes.

The Sri Lankan economy has come of age. Today, it can confidently compete in the international market place, including the huge Indian market. As the pioneers of economic liberalisation in south Asia, Sri Lanka should be one of the first countries to meet the pent-up demand in India and tap the huge market potential of India. A free trade pact with India would go a long way in Sri Lanka's quest to become a newly industrialised country by the turn of this century.

Is National Interest Being Served by Narmada Project?

Jashbhai Patel

The biggest beneficiary of the Narmada Project will be Gujarat, while the other two states, Madhya Pradesh and Maharashtra will be deprived of vast areas of forest, natural resources and will also be forced to uproot thousands of people, mostly tribals, who have lived in these regions for generations. Does Gujarat have any right to these benefits at this enormous cost?

THE river Narmada rises at a place called Amarkantak in the Maikal ranges situated in the Shahdol district of Madhya Pradesh (MP). The height of the river-bed there is 1,051 metres (3,468 ft). From there it flows down mostly westwards and meets 41 major tributaries on the way. The overall catchment area of the river is 98,796.8 square km with the Maikal ranges in the east, Vindhya ranges to the north and Satpura ranges to the south. The river passes through the following districts of Shahdol, Mandla, Jabalpur, Narsinghpur Hoshangabad, Khandwa (east Nimar), Khargone (west Nimar) districts of MP. The river forms the boundary between the Jhabua district (MP), Dhulia district in Maharashtra and Baroda-Bharuch districts in Gujarat. After passing through Bharuch district the river ends in the Gulf of Cambay. In its course from Amarkantak to the Gulf of Cambay it covers 1,312.

Narmada enters the state of Gujarat at Surpaneshwar. Before its entry, it forms roughly a 35 km boundary between Maharashtra and Gujarat. From Surpaneshwar to Poicha, which is between Chanod and Karnali, the course is more or less straight and covers about 35 km. From Poicha to Jhanor, the course is zigzag and the distance covered may amount to 35 km. From Jhanor to the Gulf of Cambay the river becomes a saline estuary which is about 60 km in length. Thus, the overall length of Narmada in Gujarat is: 3 x 35 + 60 = 165 km. Deducting the boundary and saline parts of the river, Narmada in effect is 70 km from Surpaneshwar to Jhanor. The catchment area of Narmada in Gujarat is about 10,000 sq km. This area lies in the annexed tribal regions which morally do not belong to Gujarat.

Of 1,312 km of Narmada, Gujarat can claim at the most 130 km of the river as for its exclusive right. Of this 60 km belong to the sea. With just 70 km of the river, Gujarat has master-minded the entire Narmada River Project. Although essentially a MP river, Narmada has been converted into a Gujarati river. Gujarat has claimed Narmada as its lifeline but in essence made it a deathline for Madhya Pradesh and Maharashtra.

Myth of Drought-Prone Areas of Gujarat

The state of Gujarat is a coastal part of India and the slightest common sense would tell anyone that it cannot be a drought-prone region. However, there can be drought-prone pockets which are man-made due to wanton destruction of nature's ecological balance. The average annual rainfall in Gujarat is either 50 cm (20 in) or more. There is only a single marginal strip of region where the rainfall in Gujarat is between 40 cm (16 in) and 50 cm (20 in). Otherwise, east of 70 cm line, the rainfall is between 75 cm (30 in) and 100 cm (40 in), which is good and west of the same line, the rainfall is between 70 cm (28 in) and 50 cm (20 in), which is fairly good. So the drought-prone Gujarat is a myth because 50 cm (20 in) rainfall is considered fairly good by the standard of meteorological science. Also, the average rainfall over the entire length and breadth of India cannot exceed 50 to 75 cm (20 to 30 in) The same is true for the whole world. So Gujarat should stop crying wolf and exploiting adjoining states to get rich.

The only part of Gujarat where the rainfall is less than 40 cm (16 in) is Kachchh. But Kachchh is not Gujarat. It was the greatest folly to lump Kachchh with Gujarat. That only shows the lack of scientific temper among the people in power. The rightful place for Kachchh was in Sindh. The latter is not in India, hence, Kachchh could be in Rajasthan. The tragedy of Kachchh is that the rich Kachchhis want to be with rich Gujaratis because of their business interest. They have ignored their historical, geographical, ecological, linguistic and cultural interests completely. This has proved their undoing. They have failed to help their poor brethren.

If technologists and engineers of Gujarat had cared to study their past history, their table-land and flow of water from the adjoining states, they would have come to one basic conclusion: 'dig deep and not dam'. Daming is suitable to Rajasthan, Madhya Pradesh and Maharashtra because they cannot stop the quick running waters without dams. Also they possess natural lakes. MP built its early dam between 10 and 55 AD on the Bhojpur lake. Rajasthan built its earliest dams, namely, Uday Sagar dam on the river Arat-Banas near Udaipur in 1700 and Jai Samand dam on the river Gomati-Mani near Udaipur in 1730. Gujarat is not faced with quick running waters but with soggy land. It should not copy others blindly. To quote an eminent meteorologist:

"Professor Pisharoty a reputed scientist in Gujarat, has argued that the best solution for our water and soil conservation problems is what the Dravidians did several centuries ago—the construction of about 30,000 water tanks, each about 100 m x 100 m x 10 m, in each of the 300 and odd district which have an annual rainfall of 50 cms or more. Such water ponds could improve our ecology, trees would grow around them and ground water will be recharged. By means of this alternative the vested interests now centred around major and medium irrigation works would lose the opportunity of pocketing and wasting hundreds of crores of rupees, but the agricultural producers and the nation would certainly benefit."

In the preceding section we examined the rainfall map of Gujarat and we could not find drought-prone regions. The government of Gujarat's claims about the state's drought-prone and desert areas need to be examined. We find Santrampur, Jhalod and the adjoining areas are defined as drought-prone. The Santrampur-Jhalod region receives copious rains: it receives 80 to 100 cm (32 to 40 in). Taking 90 cm (36 in) as the average for the region we see that this is good rainfall. Actually, it is better than most of the parts of Gujarat. It will be even better than most parts of India if such a survey is made. For example: Pune city and some of the nearby areas in the mountain's shadow regions receive 40 cm (15 in) of rains per year. Thus, the question before us is to understand the causes for drought in the Santrampur-Jhalod region.

This question can be understood in two ways: (1) the government arbitrarily declares some regions as drought-prone to obtain political mileage by undertaking all kinds of welfare schemes in the region to please the people; (2) some drastic climatic changes are taking place due to man-made causes. The first alternative is beyond the author's comprehension because he is not familiar

with political games. Hence, he will concentrate on the second alternative.

In nature, when do drastic changes take place? For this there is Le Chatelier Theorem: "If a system at equilibrium is disturbed the system will shift in such a way as to minimise the effect of the disturbance". Has Gujarat done anything to disturb the natural rainfall system? Ideally, the region from the river Banas in the north to the river Daman-ganga near Daman (not shown in the map) in the south is the natural boundary of Gujarat. If Gujaratis want to push their boundaries to the east, they may do some adjustment in the plain region but they have no right to enter the hilly region. By the same token Gujarat has no right to build the SSP dam where it is being built today.

As we see, Gujaratis have already entered into this slanted lined region for the past 44 years by annexing the former princely states. It is admitted by all and sundry that forests are gone or thinned and the damage done is considerable. This way 500 km of hilly track is ruined from north to south in the eastern Gujarat. What do Gujaratis expect if not the drought-prone pockets in their state? Now they are out to solve their drought problem by building the SSP dam so that they can damage 500 km of hilly track west to east in Maharashtra and Madhya Pradesh. The tragedy is that the construction of the dam goes on and their tomfoolery is unchallenged. They have money and morcha power. They have the most vulgar arrogance of wealth. They think that it is their birthright to do what pleases them without any regard to fellow feeling or compassion. They will build the dam with brute force and naturalists have to oppose this force.

Is the eastern region really Gujarat? The tribal region exactly coincides or overlaps with the eastern regions of Gujarat. This means that the eastern region in reality, is not Gujarat and the tribals living there are not Gujaratis by any stretch of imagination. This fact can also be verified by consulting the tribal map of India. These tribal regions were annexed by Gujarat to exploit their natural wealth and to use tribals as bonded labourers. Besides, these tribals are useful to project rich Gujarat's poverty and to extort grants from the central government. Even then, the fact remains that the appropriate sections of the slanted lined region be given back to Rajasthan, Madhya Pradesh and Maharashtra, so that, these tribals join their own tribes and do not remain divided. This way the tribals can fulfil their expectation for full autonomy provided the tribal regions are made autonomous within the states.

So is there a way to help drought-prone pockets of Gujarat? To answer this question, we, once again, refer to the maps. We find that hilly regions of Saurashtra and Gujarat get copious rains but these very regions are declared-drought prone. Why? The reason is: These regions do not have optimal forest cover. Hence, water runs off the rocks; running streams and small lakes dry up soon without the protection of woods. The end result is man-made drought for which there is no remedy except one: to restore the hills to their original condition. Otherwise, to pump up water from rivers or reservoirs will prove very costly and will be beyond the financial means of tribals. Thus, no dam, however, big, can help hilly drought-prone regions. The SSP dam too cannot help them and it is an acknowledged fact that these regions are not served by the SSP. The remaining drought-prone regions are close to deserts or are deserts and the irrigation there means lack of total sanity. India is not Israel. Many good lands await irrigation in India. And no one has right to divert money for insane projects.

Earlier, we have seen that the effective contribution of the state of Gujarat to the length of Narmada river is just 70 km in 1,312 km. The overall catchment area of the Narmada basin is roughly 1,00,000 sq km out of which Gujarat's contribution is 10,000 sq km which is in the annexed immorally held part of the state—most of which should go to MP. Gujarat practically reserves this 10,000 sq km for its exclusive use. It does not contribute a drop to the common pool. Besides, out of the remaining catchment areas amounting to 90,000 sq km mainly in Madhya Pradesh and Maharashtra, Gujarat's contribution is paltry 423 sq km. Yet, it cries wolf. It claims that all the water goes to sea as a great loss to the nation. This is indeed surprising. Who prevents Gujarat from storing the run off waters of Narmada in its own region from Garudeshwar to Aliabet in Gulf of Cambay? Madhya Pradesh and Maharashtra cannot prevent because they cannot stop run off waters without spending billions of rupees which they do not have. Certainly, since Gujarat claims that it can raise lots of money from all kinds of sources it can store the water in its own region and then supply to the rest of the country by pipelines. But Gujaratis do not want to do that. They want to build the dam at the border of the state and want to ruin 400 or 500 km of Narmada in Maharashtra and Madhya Pradesh and construct an artificial river of 460 km length in their own state for their exclusive use except for a paltry grace to Rajasthan.

What is injustice? Do money and political clout play any role in doing injustice? Did the Narmada Tribunal Award come during the prime ministership of Morarji Desai? The answer to these questions readers have to discover for themselves. Then, will it be a wonder if the award is in favour of Gujarat? The very fact that a riparian state like Gujarat with 423 sq km of contribution in 90,000 sq km gets equal representation with other states on the Narmada Control Authority does not prove the injustice? Only the weakling states can accept such injustice. Otherwise, the concerned states would have told Gujarat that this 423 sq km of contribution too is ours and Gujarat has no right of any representation on the Narmada Control Authority.

Award of Narmada Water Disputes Tribunal

The Gujarat government and the vice chairman and managing director of Sardar Sarovar Narmada Nigam Limited harp again and again on the remarkable 'decision of the tribunal'.

The Narmada Water River Disputes Tribunal gave its final decision in 1979. The main parameters of the decisions were as under:

(a) Allocation: (at 75 per cent dependable yield)

	MAF
MP	18.25
Gujarat	9.00
Maharashtra	0.25
Rajasthan	0.50
	28.00

(b) Height of the Dam:
FRL at 455.0'

(c) FSL of the Main Canal—300 ft: To be extended up to Rajasthan border to cater irrigation to the drought-prone areas of 75,000 ha in Barmer and Jallore districts of Rajasthan.

(d) Power allocation: (in percentage)

MP	57
Maharashtra	27
Gujarat	16

There would be regulated releases from Narmada Sagar Project in MP 280 km upstream.

Did the Gujarat government and its spokesperson P A Raj ask themselves a simple question: Is this a fair victory? A riparian state with 0.5 per cent contribution to the catchment area taking away 33 per cent of water and 16 per cent of electricity. Above this, this state keeps 10 per cent of its own catchment area for its own exclusive use. The state also gains equal rights to sit on the Narmada Control Authority and dictate terms on the basis of the given award. This is patent injustice.

One would like to pose this simple question: Suppose Bangladesh insists on building dams on Ganga and Brahmaputra rivers exactly near the borders of India and submerge India's vast territory, would India agree? Obviously, the answer is simple 'No'. What Bangladesh talks of international laws as the one given here?: "It is well-established in law that the waters of a natural stream or other natural body of water are not susceptible of (*sic*) absolute ownership as specific intangible property. On the contrary, flowing water is publicijuris or res communis and not subject to individual ownership" would India agree? The answer is again 'No'. Because a law cannot be used to destroy people. There were protests registered with the Tribunal:

(i) ... on November 28, 1963 D P Mishra, the chief minister of Madhya Pradesh, in a letter to K L Rao, the union minister for irrigation and power, clearly stated that the

state of Madhya Pradesh was not in agreement with the statement that the Navagam dam should be built up to FRL 425 and the entire benefits should be enjoyed by the state of Gujarat.

(ii) The government of Madhya Pradesh argued that Navagam dam should be restricted to FRL 162 since that was the bed-level at the Madhya Pradesh border.

(iii) The Khosla Committee rejected the proposal of the Maharashtra government that the FSL of the canal should be at RL 185/190.

(iv) (Madhya Pradesh) claimed that a better utilisation of Narmada waters would be possible if part of it were diverted to the Tons Valley in the Ganges basin.

The protests numbered (i) to (iii) are absolutely reasonable but the committee and/or tribunal pushed them aside and imposed their will. This was indeed an unreasonable and unpardonable folly which proves that Madhya Pradesh and Maharashtra have not accepted the award but their governments have compromised the interests of their people for the so-called national interest.

The most remarkable claim by MP is found in number (iv). It shows how desperate the government of MP was to save its sacred waters. It was prepared to transfer them into sacred Jamuna instead of allowing them to flow into the mighty man-built base gutter of Gujarat.

Tribunal's Reasonings

Now, we will see how the tribunal tried to resolve the Narmada water disputes and how the government of Madhya Pradesh tried to contest for many years to save its sacred river. We will list here the main arguments of the tribunal:

(i) Since water resources are not divisible into pieces like land lots, the equality to which parties are entitled does not mean equal division. It means equality of consideration, it means equality of opportunity which very often may not result in the same quantity of water.

(ii) The tribunal refers to various international treaties to establish the convention that the contribution to run-off is not an important criterion for apportionment.

(iii) (The Tribunal) felt that the Helsinki Rules clearly show that in determining a state's reasonable and equitable share in the beneficial use of waters of a river basin, the needs of the state as a whole should be taken into account and not merely the basin portion thereof. Under Section 3 of the Inter-State Water Disputes Act of 1956 also, the state is considered to be an integral unit and its interests include the well-being of its inhabitants within its entire territory including areas outside the river basin.

These are the basic principles used to resolve the Narmada water disputes. Are these principles absolutely valid in the present context? Let us see them one by one.

The item (i) is a beautiful rhetoric which can be used to justify any water dispute and any judgment.

Item (ii) shows the slavish mentality of the Indian authorities, because they cannot think up anything original without consulting the foreign laws—in this case, international laws. All Indian states do not have international borders, but only state borders. The principles ought to have been formulated taking into consideration the topography of basins and not the verbosity of foreign laws.

The height of absurdity is reached in applying item (iii) to the Narmada basin. This basin is essentially intra-basin and Madhya Pradesh cannot use its water for the entire state without resorting to some artefact such as tunnelling water through mountains. Thus, there was no question of considering "the well-being of its inhabitants within its entire territory including areas outside the river basin". This principle was specifically used to favour Gujarat. With a 70 km river, it can use the Narmada waters across trans-basins and cover a large portion of its entire territory. This is patent injustice and even a blind man can see it.

Did Madhya Pradesh feel this injustice? Here is the evidence: (a) "Madhya Pradesh had contended before the tribunal that, along with the factors listed by the Nelsinki Rules (1956) equal weightage should be given to the contribution of Gujarat and Madhya Pradesh to the dependable flow. That is, 9.2 per cent for Gujarat and 90.8 per cent for MP at 75 per cent dependability." This plea was ruled out using item (i) and the quote given with reference to Bangladesh (p 16).

(b) "Both Madhya Pradesh and Maharashtra also stressed that the question of equitable apportionment must be related exclusively to the area and people within the basin. Extension of irrigation to adjoining extra-basin areas could not be justified on the grounds of their dependence on the waters of the basin in question or the easy commandability of such areas. MP and Maharashtra argued that the basin was a legal entity and hence should be treated as such; the water apportionment had to be intra-basin and could not be trans-basin". This was the most valid argument, because Narmada flows between Vindhya and Satpura ranges for more than a thousand km in its course of 1,312 km. But this was ruled out by item (iii). This was stupidly extraordinary.

If anyone examines the tribunal's report, one finds that Madhya Pradesh's high points are ignored and Gujarat's high points are artificially inflated. For example, Madhya Pradesh gains high points as to cultivable area, net sown area and population dependent on agriculture, whereas Gujarat is way down in these categories. To prop up Gujarat the myth of drought area and population affected by drought is brought in. These categories are not easily verifiable and figures can be easily manufactured. Rather, figures can be grossly manipulated. What we find in the report is this: drought areas in Gujarat are 1,74,630 acres and weightage given is 73 per cent; drought areas in MP are 1,01,020 acres and weightage given is 27 per cent, people affected by drought in Gujarat are 54,80,000 and weightage given is 72 per cent; people affected by drought in MP are 30,70,000 and weightage given is 22 per cent. Gujarat is propped up and brought to parity with Madhya Pradesh by such means. This casts shadows on the tribunal award.

This is not the end of the story. The way the Khosla Committee recommended the height of Navagam dam is the blackest chapter among the papers on the SSP dam. Madhya Pradesh and Maharashtra wanted to build Jalsindhi dam between Harinphal and Navagam. How the Khosla Committee scuttled this proposal, we read as under:

> The committee was totally in favour of the higher Navagam dam. It observed that instead of a higher Navagam dam, if Harinphal or Jalsindhi dams were raised to the same FRL, the submergence would remain almost the same because the cultivated and inhabited areas lie mainly above Harinphal while in the intervening 113 km gorge between Harinphal and Navagam there is very little habitation or cultivated areas.

The Khosla Committee observed:

> ...that they had kept in mind national interest rather than state boundaries when considering the possibilities of harnessing the waters of the river Narmada. They further observed that irrigation should receive priority over power and the water going waste to the sea without doing irrigation or generating power should be kept to the unavoidable minimum.

Now we will see the fallacy in these reasonings. The Navagam dam submerges 214 km of the valley and 37,000 ha of the surface area. The Harinphal dam does "almost the same", but it cannot do anything between Harinphal and Navagam, a distance of 113 km, because the dam is at Harinphal. If you want 113 km to come into the picture, then the Harinphal dam just submerges 214-113 = 101 km. By this token the surface area too will be less than 37,000 ha. Anyway, the important point to note is this: "in the intervening 113 km gorge... there is very little habitation or cultivated areas". Thus, the intervening 113 km submergence is of no account even though it involves at least 19 villages of Gujarat and 36 villages of Maharashtra. This is the logic the men in high places use. Hence, bad arithmetic gives us: 214 km = 101 km. Besides, we have: bad arithmetic + bad logic = national interest.

Obviously, the members of Madhya Pradesh were dumbfounded with this type of reasonings. This, we may see from the following narration.

> Gujarat had asked for a height of 530 ft on the shrewd calculation that even after the tribunal reduced the height substantially (say 80 ft or so), a very high dam could still be built. It has been pointed out [Mathur 1978] that Madhya Pradesh was placed in a 'Catch 22' situation regarding the height of the Navagam dam. In the master plan prepared by Madhya Pradesh in 1965 it had proposed that a dam at Harinphal of the height 465 ft

to convince the tribunal that the state wanted to make optimum utilisation of the waters of the river Narmada. At the same time, Madhya Pradesh also tried to argue that the height of the Navagam dam should be restricted to 162 ft so that the dam would submerge no areas from Madhya Pradesh (162 ft is the bed level of the Narmada at the border between Madhya Pradesh and Gujarat). Whether a 465 ft high dam is built at Navagam or at Harinphal, the submergence in Madhya Pradesh would be nearly the same. Hence, if the state of Madhya Pradesh was willing to condone submergence up to 465 ft with a high Harinphal for the sake of hydel power, then it could no' as well argue against a 465 ft SSP, provided that it was being compensated for the loss of potential hydel power generation. Hence, the tribunal settled for a 460 ft high Navagam dam.

This long discourse clearly shows that Gujarat is building the SSP dam at Navagam after gaining a totally unfair victory which was full of legal quibblings and political chicanery. To cover up these dirty possible games, it had to invoke official Secrets Act and needs an advertising agency to do its false propaganda. Readers should ask themselves: Are dams built in this fashion anywhere in the world?

The myth of drought has been invented to serve the industrial belt between Baroda and Ahmedabad. Irrigation too is meant for rich farmers who are mostly found in this region. It was explained earlier that drought areas cannot be helped by building any dam howsoever big. Gujarat has shown drought areas under three categories: (a) mountainous or hilly regions, (b) deserts, and (c) regions adjoining to deserts. Earlier it was pointed out that the hilly regions of Santrampur, Jhalod cannot be served by the SSP dam because to pump up water is very costly. The only way out is to restore these regions to its original condition. The desert regions too cannot be served by canals because the sand dunes offer adverse or uneven gradient, the sand accounts for adverse absorption of water and high temperature and zero humidity explain the adverse evaporation. The only way out is via pipe-lines and not canals.

Ambika Singh, the agronomist appointed by the tribunal said to the panel:

> I have arrived at the conclusion that Ranns area is characterised by high salinity, a very low horizontal permeability, a vertical permeability of nearly nil, a high ground water table and an impervious layer near the ground water, and low rainfall. From this description it could be easily understood that reclamation of the area, even if possible, will be a very difficult task. It has not been established till now whether or not desalinisation of soil is possible.
>
> (He) concluded that (considering the proposed pattern of irrigation and transit losses) the amount of water required to irrigate one acre in Banni would suffice to irrigate 3.9 acres of better quality land near the canal head.

Did tribunal agree with its agronomist? Here is its viewpoint.

> Gujarat's claim on Narmada waters to irrigate areas in the little and the Great Rann of Kutch and the Banni area also was unreasonable. The assessor Dr Ambika Singh had expressed the opinion and the tribunal had concurred with his view that the desalinisation of these areas would prove costly and impracticable.

Readers should note again that India is not Israel. Good land awaits irrigation in the country. Also, Israel has not diverted a mighty river like Narmada in its desert. Their methodology is original.

Now remain the remaining drought areas which are adjacent to the desert areas. Those areas very close to deserts cannot differ much, hence a little portion remains which may benefit. Actually, an agronomist's opinion is very necessary even for this little portion.

The tragedy of the whole situation is: the tribunal props up Gujarat by giving high weightage to drought areas and the people affected by drought and then do not serve them by the dam, nor does it lower this weightage and rule out such a high dam. For some time the Gujarat government even imposed the Official Secrets Act which was lifted under public pressure. Are dams built under secrecy like atom bombs or destructive weapons?

P A Raj has waxed eloquent on the benefits of use of the SSP canal: "4,720 (now 8,215) villages and 131 (now 132) urban centres in Gujarat state would get a permanent solution as regards the drinking water supply needs". He also gets emotional and points out that "75 per cent of the command in Gujarat is drought-prone... and it caters for domestic water supply of the arid areas of Saurashtra and Kutch; it is a real drought-proofing project and hence the life line of Gujarat."

The SSP dam command area is 18 lakh ha. 75 per cent of it is 13.5 lakh ha. The command areas in the districts of Surendranagar, Banaskantha, Mehsana and Kachhchh come out to be (according to Raj) 3.04 + 3.13 + 1.50 + 0.37 = 8.04 lakh ha. These calculations show that 60 per cent of drought-prone areas are in the regions adjacent to deserts. If the canal is passing through this arid region, of course, people will fill their pots with canal water. This is not equivalent to supplying potable drinking water. Anyway, the main question is: has Gujarat a right to build canals in this type of terrain even if the agronomist's ratio 1:4 (exactly 1:3.9) improves to 1:2 or 1:1.5. The author does not think so because it is still a national waste of money and water resources. Is it absolutely true that Narmada waters cannot be used in a better way elsewhere than in this bleak terrain? On the basis of merit Gujarat has no right to build such a high dam at Navagaon, irrespective of the Tribunal's favour.

Plunder of Annexed Adivasi Areas

We have already seen that Gujarat gets sufficient rains every year. There may be some lean years, but then this is true of whole India which includes Madhya Pradesh and Maharashtra. Did the tribunal worry about drought-affected persons of these two states? MP gets very poor weightage. We leave aside this injustice and come to see how Gujarat generated drought areas in the state.

In the last 44 years Gujarat has plundered the forest wealth of annexed adivasi areas right from the Danta state in the north to Dangs in the south. What can be the outcome—drought. According to the report of the principal of the Forest Rangers College at Rajpipla, "Rajendra Sharma stated that between 1970 and 1990, the forests which extended west of Rajpipla had been decimated systematically not only with the full knowledge but with the active participation of the member of the legislative assembly from Rajpipla and the series of ministers in charge of the forest department of the government of Gujarat. He added that this systematic and organised forest felling had led to a recession of the forest area by about 60 km to the east of Rajpipla! The people of Rajpipla openly stated that Chandubhai Deshmukh, Amarsingh Choudhari, Shri Patel... and Virji Munia who had all been ministers of forests of the government of Gujarat had all been responsible for the politicisation of tribals in the Rajpipla area which had eventually led to the commercialisation of forest resources and the large-scale illicit removal of timber. Further, Mr Sharma added that in the Rajpipla division the efforts made by the social forestry department had not made any dent in the rate of forest depletion. He stated that Karaya white gum extracted from Sterculia urens was being systematically pilfered. In such circumstances, he said, it was no surprise that in the forest areas there was a physical battle between the forest department on the one hand and the local leaders enjoying political patronage, on the other."

This is a true story not only for the Rajpipla region but also for the whole eastern region. The length of this region is 500 km from north to south and is the easternmost part of Gujarat habitated by adivasis. In reality (or morally) this region could be classified as a trust territory. Gujarat had no right over this region before annexation and now they have doubly lost it by devastation and default. The Rajpipla area is highlighted here because Rajpipla is 23 km by road from Garudeshwar on Narmada and the region lies on the southern bank of the river and extends up to Manibeli in Maharashtra where the present anti-dam satyagraha is on. In retrospect, "Near the Gujarat broder, the Rajpipla forests have been ravaged completely by timber contractors, with the implicit and explicit support of the local members of

the legislative assembly of Gujarat, during the last two decades. Gujarat politicians have systematically encouraged the decimation of the forest areas right up to the district of Jhabua in Madhya Pradesh on the excuse that these will in any case be submerged under Garudeshwar and Sardar Sarovar reservoirs. But the forest destruction has proceeded far beyond the likely submergence areas. The local Bhils, who are substantially dependent on forests, have either been pushed further into or near the Dangs or towards the Alirajpur areas across the Madhya Pradesh border." The Rajpipla area had "tigers, panthers, civets and jungle cats, the mongoose, hyena, wolf, wild dog, foxes and jackals, others and sloth bears. The black buck, once a common sight, is now seen occasionally." This is the fate of wildlife. How can anyone assess this loss in terms of money or compensation. Yet, the Gujarat government speaks of compensatory afforestation. . This is height of callousness, but let us assess even this callousness.

The SSP-dam will submerge 37,000 ha of land of which 11,000 ha are forests. The government of India has released on September 8, 1987, 4,165.91 ha of forests for Gujarat, 2,731.00 ha for MP and 6,488.54 ha for Maharashtra. The total area of forests comes out to be 13,385.45 ha. Of this area, 11,000 ha will get submerged due to the dam. Gujarat's share is 4,523 ha out of these 11,000 ha. Thus, Gujarat will compensate only for 4,523 ha. The rest is not his concern because the remaining areas are not in Gujarat.

As against this 4,523 ha Gujarat will grow 4,650 ha of compensatory forests in nine villages of Kachchh. And wide publicity is given to this feat. But let us look at the opinion of principal Rajendra Sharma. "In his opinion, the area selected for afforestation is absolutely unsuited for raising trees, because the level of ph (acidity) in these areas is greater than 9.5. Prosopis juliflora which had been selected for plantation will not survive in such soils." He ended by stating that trying to raise compensatory forests in the Rann of Kachchh will be an exercise in futility if not in sheer stupidity.

Of course, the Gujarat government can bring in some other forestry expert to prove that Sharma is wrong. The author does not deny this possibility. Nay, he is aware that the Gujarat government may invite journalists and show them as a matter of fact the compensatory forests in the desert areas of Kachchh and thereby prove this opinion to be unacceptable.

Can artificial forest be equated to a virgin or a true forest? The answer is an absolute 'No'. Compensatory forestry is agro or commercial forestry. It is beneficial to the government officials and contractors in two ways: they make money while growing these forests as well as at the time of felling. This way money always remains in the pipelines. To grow a natural forest requires devotion, love for nature and a rare expertise.

In the present case, in a 113 km stretch or gorge between Harinphal and Navagam, there may be 6,488 ha of natural forest of Maharashtra and 2,731 ha of MP and most of these will be submerged by the Sardar Sarovar. Who will compensate for this submergence is not clear. However, we may assume that the governments of Maharashtra and Madhya Pradesh will grow roses, sag, sal and deodar trees in the deserts of Thar because ample useless land is available there and in the present scientific era impossibility can be converted into reality. Even then, the question remains: Why will Rajasthanis accept these graceful faked forests and why will Maharashtra part with their genuine forests? When consumer societies are supported by the state governments to guard against the ills of faked goods, are there no societies to guard against government's faked forests?

About 33 per cent of India's land used to be covered by forests. Obviously 20 per cent is natural forests inaccessible for commercial use, 8 per cent has to be for the homeland of adivasis who number 6 to 8 per cent of India's population, 5 per cent of forests then will be available for commercial use. It is said that forest cover has come down to 20 per cent (forester's estimate) or 10 per cent (ecologist's satellite based estimate). This is near bankruptcy. Besides, all Indian states cannot have 33 per cent forest cover, for example, Rajasthan. This means that some states should have 66 per cent of forests, whereas some states may not have natural forests at all. Also hilly regions in any one state need to have 80 per cent of forest because the flat populated areas will have none. The Narmada flows between Vindhya and Satpura ranges, hence this region ought to have 80 per cent of forests. More so, because MP is adjacent to Rajasthan which in turn is adjacent to Sindh in Pakistan and MP has to compensate for Rajasthan and Sindh. Similarly, Maharashtra has to compensate for Gujarat. So, Gujarat has no right whatsoever to destroy Maharashtra or MP forests.

Comparison of SSP and NSP Dams

In this section we give some data for the Narmada Sagar project dam and the SSP dam. This is necessary because the NSP dam is nothing but an appendage to the SSP dam. This point will be clear once the readers examine these data.

The points to be noted are: (a) the true dam height and length, (b) the catchment area, (c) the live storage capacity of the reservoir and the irrigation facility, and (d) the electric power.

Gujarat builds a 460 ft high dam whose length is 3,970 ft. The owner state of the river, MP, is just given a 250 ft high dam whose length is 1,894 ft. Gujarat uses 88,000 sq km of the catchment area for the SSP dam in which its own contribution is just 423 sq km. It reserves its own 10,000 sq km of catchment area for its own exclusive use. MP uses its own 61,642 sq km for its NSP dam, which is only true on paper, in actuality it is used by Gujarat but the said area gets included in the above 88,000 sq km. Gujarat's SSP dam submerges 37,000 ha of lands, of which, 11,000 ha are forests. But Gujarat's own submergence is a paltry 4,523 ha, the remaining 32,477 ha is of Maharashtra. MP's NSP dam submerges 90,000 or more hectares, of which 44,363 ha are cultivable lands and 40,332 ha are forests. But this submergence though accredited to the NSP dam is in actuality due to Gujarat's SSP dam. Thus, according to Baba Amte, the SSP and NSP dams are together going to submerge about 1,30,482 ha of land of which 55,681 ha is mostly prime quality cultivable land and 56,066 ha is forest land. Except 4,523 ha, all the land belongs to MP and Maharashtra, predominantly the former. In short, Gujarat actually submerges 1,30,482 ha of land of which 1,25,959 ha will lie outside its own territory, that is, in Maharashtra and MP.

Gujarat's ministers, its newspaper editors, its religious leaders, its Gandhian sarvodaya workers, its spokespersons, keep saying that the 4,523 ha submergence in Rann of Kachchh will be compensated, but they never speak about 1,25,959 ha submergence in others' territory. Gujarat contributes 0.5 per cent to the catchment area and obtains 33 per cent of waters. But then it does not know where to store them in its own territory. So it submerges others' territory and then claims that it is in the national interest. It builds a 460 ft dam, but the live storage capacity of its reservoir is only 4.73 MAF, that too, after damaging 214 km of Narmada mostly in Maharashtra and MP. Thus, the storage of water is mostly in Maharashtra and MP. Gujarat has taken 33 per cent of Narmada waters which turns out to be 9 MAF. So far 4.73 MAF has been stored in the adjoining states. The question is: Where to store the remaining 4.27 MAF of water? Of course, it has to be in Narmada. Where? They have already used 214 km of river up stream from the SSP dam site. Thus, they need another dam which is 300 km away from the SSP dam site. This is the NSP dam, 250 ft high which is in real terms a storage tank of the SSP dam. The reservoir here is not lengthwise but is irregular. Hence, it submerges not the banks of the river but adjoining hilly terrains and forests. Hence, the damage is drastic—90,000 ha or more. The live storage capacity of this smaller dam is greater than that of the SSP. It is 7.9 MAF. Of this 4.23 MAF is utilised by Gujarat via regulated releases, the remaining 3.67 MAF is for MP. In spite of this fact, Gujarat harps that the SSP submergence is the lowest (37,000 instead of 1,30,482). Does MP need 3.67 MAF of water for irrigation? The answer is no. The reason for this 'no' is astonishing: the NSP is allotted only a little (1,23,758 ha) for

irrigation as against 18 lakhs ha for the SSP, that too, for some desert like areas (8 lakh to 13 lakh ha). Thus, MP destroys 1¼ lakh ha of excellent cultivable land and virgin forest to irrigate as much or less of its land. Does MP need the NSP dam to irrigate a paltry 1¼ lakh ha of its agricultural land? The answer is again absolute no—9 MAF of Gujarat suffices for its 18 lakh ha command area, which amounts to 0.5 MAF per 1 lakh ha of land with substandard soil. Thus, MP will not need more than 0.5 MAF of water for its 1¼ lakh ha command area. Assuming that MP will utilise 0.67 MAF of water for its use from its allotment of 3.67 MAF, even then, 3 MAF is surplus. This surplus is a cushion for the SSP dam which can be used in time of distress. Thus Gujarat takes away 12 MAF of waters of Narmada as against its allotment of 9 MAF. This is indeed clever. Not only that, it makes MP pay 82 per cent of the cost on the NSP dam and it pays only the remaining 18 per cent which too it did not want to pay in the first place. Thus, with little money Gujarat takes away all the benefits. Gujaratis may say that MP's downstream Omkareshwar and Maheshwar dams too utilise the NSP waters. Maheshwar is not an irrigation project and Omkareshwar's irrigation project is not bigger than that of the NSP, and hence it cannot utilise more than 0.5 MAF, which it can collect from its own catchment area, irrespective of the NSP. Hence, it is useless to argue on these points. Gujaratis may point out that MP is utilising these waters for generating electricity. This point we will deal separately below.

Readers may wonder that author's calculations may be wrong somewhere. If this is the doubt we proceed by an alternative path. Rajasthan is given 0.5 MAF to serve its 75,000 ha of command area. We know the agronomist ratio for Banni in Kachchh. It is 1:4. Assuming that Rajasthan's soils is better than Banni's, this ratio may improve to 1:2, or 1:1:5, but it cannot be 1:1. This means that 0.5 MAF in MP will serve the command area of 1,50,000 ha or 1,12,500 ha. This proves that the NSP and Omkareshwar can use at the most 1 MAF for irrigation purposes. To be on the safer side we assume 1.63 MAF instead of 1 MAF. Even then, Gujarat takes away 11 MAF out of the combined live storage capacity (12.63 MAF) of SSP and NSP. It may be that Gujarat uses 9 MAF, but then keeps 2 MAF as cushion for the SSP. Whichever way we may look, the NSP dam is nothing but an appendage or a storage tank for the SSP dam. Gujarat gets away with a huge dam at the expense of MP. It pays very little.

Now we see clearly NSP as an appendage or a storage tank of SSP. This can be further proved by the following evidence: "It is on record that lowering of the height of the dam (i e, NSP dam) from 860 ft to 814 ft (i e, from 250 ft to 200 ft) would mean that the land submerged would come down by 80 per cent (i e, from 90,000 ha to 18,000 ha). There is little substance in the criticism from Gujarat's industrial interests that this would affect the viability of the project. Apparently the Madhya Pradesh government had proposed just such a step at the Narmada water disputes tribunal as well. Why the proposal was not considered in the first place is a disturbing comment on the lack of concern for the ecological viability of the project". This evidence proves beyond doubt that the tribunal has shown partiality to Gujarat.

Now we come to the next question : Does Gujarat really need a 455 ft dam? Gujarat is using its dam's water only from 455 ft to 363 ft. The canal outlet is at 300 ft. It needs 363 ft of water above the bed level to keep the generators operative. Thus, Gujarat has an effective 100 ft dam. The outlet is kept at 300 ft because it wants its canal waters to reach the borders of Rajasthan. Also, it wants to use 363 ft of dam as a dump or a pit for silt, so that it can use the dam for the next 50 or 100 years without much worry. This is pure extravagance. Gujarat deserves a dam between Garudeshwar and Aliabet and this should be not more than 100 ft. The waters should be used intra basin (i e, between Tapi and Mahi) and not trans-basin (i e, up to state's borders).

TABLE

	SSP Dam	NSP Dam
Dam Height		
Top of dam height	146.5 m (480.6 ft) + 22.9 m = 169.4 m (MSL)	267 m (MSL) = 880 ft
Maximum height above mean sea level (MAL)	163 m (MSL) = 535.0 ft (MSL)	
Average bed level of river at dam site	22.86 m (MSL) = 75.0 ft (MSL)	
Actual maximum water level (MWL) height, i e, true dam height	140.21 m = 460 ft	84.4 m = 250 ft
Gates (spillway)	30	20
Dam Length		
Length of the dam	1210 m = 3970 ft	574 m = 1894 ft
Catchment Area		
Catchment area above the dam site	88000 sq km.Gujarat's contribution 423 sq m	61642 sq km
Rainfall	Max	
Mean annual rainfall	Navagam: 112 cm (44 in)	Catchment area: 140 cm to 75 cm
Reservoir		
Maximum water level (MWL)	140.21 m = 460 ft	266.35 m (MSL)
Full reservoir level (FRL)	138.68 m = 455 ft	266.13 m (MSL)
Minimum draw-down level (MDDL)	110.64 m = 363 ft	
Gross storage capacity	7.70 MAF	10.8 MAF
Dead storage capacity	2.97 MAF	2.9 MAF
Live storage	4.73 MAF	7.9 MAF
Annual evaporation losses	0.50 MAF	
Length of reservoir	214 km	
Maximum width of reservoir	16.1 km	
Average width of reservoir	1.77 km	
Submergence		
Submergence at FRL	34,867 ha (37,000 ha according to Shri Raj)	90,000 ha
Submergence at MWL	41,000 ha at flood level	
Canal		
Type	Lined contour canal	Lined with concrete
Length	445 km	248 km
Culturable command area (CCA)	21,19,000 ha + 70,000 ha in Rajasthan	1,74,967 ha
Irrigation command area	17,92,000 ha (Gujarat)	1,23,758 ha
Power		
Installed capacity	1450 MW	1000 MW
Number of units	6 (200 MW each on dam) 5 (50 MW each on canal)	8 (125 MW each)

The SSP dam and its canal power houses will produce 1,200 + 250 = 1,450 MW. Madhya Pradesh's NSP, Omkareshwar and Maheshwar power houses may produce 1,000 + 390 + 240 = 1,630 MW. These are then the bare facts. We do not know for the present how 1,450 MW electricity will get distributed among MP, Maharashtra and Gujarat although on paper it is 57 per cent + 27 per cent + 16 per cent = 100 per cent. We have to wait to see in how many phases they produce the targeted electricity. The production of electricity comes much after the dam. So, we cannot deal with facts, but arguments. Also, it should be noted that in the present case electricity is just the by-product because MP can produce electricity in a better way.

Gujarat makes MP spend 82 per cent of the NSP dam's cost because it uses say 0.9 MAF of water for irrigation and the rest (7 MAF) for electricity. In the first place, let us see why MP produces electricity while releasing regulated supply of water for SSP. Between NSP and SSP dams, there is a fall of 860 ft (FRL) to 460 ft (FRL), i e, 400 ft. Now, if this water runs down without being utilised for electricity then the energy stored in the water at the higher level will go waste and that is national waste. Thus, MP has no alternative but to produce electricity at the NSP site (whether it is the best site or not) for the first fall of 250 ft, then again at Omkareshwar for the second fall of say 90 ft and then at Maheshwar for the third fall of say 60 ft. Actually, MP has no alternative but to produce electricity at the NSP site even if the dictating state's choice is bad. Not only that, the Omkareshwar and Maheshwar dams too act as regulators for the SSP dam. If Gujarat does not pay service charges or does not contribute to the cost of these dams then it is a further exploitation of MP. Thus, Gujarat is in no way being charitable to MP when the latter is producing electricity at an exorbitant cost to its environment and at a higher price. The grave injustice done to MP is that it is not given any choice or voice. A riparian state which has all the rights over the river is given a minimum say, whereas a riparian state which has absolutely no rights over the river, at least above the dam site, is given maximum say.

Had MP been given a free choice, it could have utilised its waters and produced electricity in a much better way. Hence, it is MP, which is storing and regulating the supply for the SSP dam, is doing charity to Gujarat and not vice versa. It is indeed a sad kind of development scheme in which a poorer state is made to serve a richer state.

The SSP and NSP dams are thus one and the same dam located at different places, i e, at Navagam in Gujarat and near Punasa in MP and the storage of water is primary and generation of electricity is secondary, that too, the latter is merely a by-product.

For the SSP dam, Gujarat gets Rs 2,063 crore from MP, Maharashtra and Rajasthan, whereas pays Rs 828 crore (B) on the main dam and Rs 809 crore (B) on the power house, that is Rs 1,637 crore. This way too it seems Gujarat gets away with the dam free of costs.

The tribunal has started with wrong premises: it wants to use Narmada intra-basin for the first 1,182 (1,312 - (70+60)) km and trans-basin for the last 130 (70+60)) km—actually 70 km. This is done just to favour Gujarat. Once, you begin with this premise, Navagam in Gujarat becomes the best artificial site for a dam because Narmada just enters Gujarat above it. This premise destroys valuable natural dam sites like Jalsindhi, Harinphal and makes redundant sites like Maheshwar, Omkareshwar. Gujarat also knows that if MP fails to build its own dams then too nothing will happen to it except that it will not get regulated flow. On the other hand unregulated flow will be copious and Gujarat can take as much advantage as possible of this extra flow of water.

Conclusion

(a) The number of people who will get ousted by the Narmada project ranges from 1,00,000 to 3,00,000 and the author does not know which figure he should take as reliable. Assuming the lowest possible figure 1,00,000 as true for the SSP-NSP combine, even then, human suffering involved is heart rending. Assuming four persons to a family, this means 25,000 families and 250 villages. To honestly document the aspirations and hopes of 25,000 families is not an easy task. To complete the task in a year or two would need at least 250 well-qualified social workers.

(b) The origin, living, and artistic traditions, especially paintings of Narmada Man (5500 BC) and of Navdatolian Man (1600 to 1440 BC) are linked to many of the sites which will be destroyed by the project. Ancient and medieval historical sites, such as Maheshwar or Mahishmati and Bhojpur, and Dhar which had Bhoja-Sata University. There is a ruined dam (10-55 AD) on the Bhojpur lake. Flora and fauna of the Narmada basin, specifically, magnificent sal forests. Historical monuments and archaeological sites. And, temples will all be submerged. To put before the readers what is already on record: "The archaeological survey of India has recently completed studies of the historic monuments and archaeological sites. The main conclusion which may be derived is that more than a hundred monuments will be submerged and lost forever. Neither the project authorities nor the World Bank have made an assessment of this loss. In addition, more than 132 prehistoric sites, which are literally a goldmine for archaeologists, will be lost. It may be possible to transplant some of the temples and monuments physically, but in the case of prehistoric sites the loss will be permanent."

(c) Narmada has preserved very useful older alluvial deposits (1,00,000 years old) which will help in studying past climatic changes and the river floodings. Those areas come under paleoflood and paleomonsoon studies. This is a task for specialists in the aforesaid fields.

(d) The Gujarat government has assured all that the SSP dam is safe against any earthquakes. Accepting this claim as honest, what does it mean? It means that the government has used the latest technology in constructing the dam. What is great about it? The dam is being built in 1991 and obviously the dam will be built using the 1991 technology. There are cities in Japan and in Californian coasts of the US where buildings are seismically shock-proof. The SSP dam too may be shock-proof in this sense. It only means that the 4,000 ft (i e, length of the dam) of the dam is shock-proof and will not collapse and the towns of Bharuch district are safe. But this does not rule out the reservoir induced seismicity all around 212 km of submergence. If this seismicity manifests after the completion of the dam then people of Maharashtra and MP living on the Narmada banks will never be secure unless they learn to live with earth tremors as Japanese do.

The SSP-NSP combined dams destroy 1,30,482 ha of virgin forests and cultivable land of high quality mainly in MP and Maharashtra to irrigate 18 lakh ha in Gujarat, of which 75 per cent (i e, 13.5 lakh ha according to P A Raj) is drought-prone. That is, 9 lakh ha is arid and remaining 4.5 lakh ha is of poorer quality of land than in MP. This means that a small high quality part of India is destroyed to serve a large-arid and semi-arid part of the country. This is called national interest. Obviously, this is a great fallacy. Normally, waters are diverted from arid regions to fertile regions and not vice versa. And, that is national interest. In Russia, Siberian waters were diverted to some fertile regions. In the US arid region waters are taken to fertile land.

It is a normal practice, that people from arid and semi-arid regions (i e, drought-prone regions) should migrate to more favourable regions and not vice versa. In the present case, people residing in favourable regions and who have no complaint whatsoever against nature are first made destitute and then shown charity. This is a crime against science and humanity. High technology is there to serve science and humanity; it is not there to destroy well-settled people. If the Gujarat government is so rich as to build a huge dam, relocate people who do not need in the first place relocation, why does it not relocate its own people in favourable regions within the state? This will be in the national interest.

Gujarat has done injustice to Maharashtra by building the Ukai dam and making Maharashtrian adivasis destitutes. It got away

with that crime easily. Later, it did injustice to Rajasthan by building a dam at Kadana on the border of Gujarat. It made Rajasthanis and the Rajasthani-tribals destitutes. Now, it is the turn of MP. And, this is all in the name of national interest. In building Kadana, or Ukai or the SSP, Gujarat sees that it suffers the least damage and causes vast damage to the adjoining states. In the present case, 19 villages are submerged in Gujarat, whereas 36 and 193 villages are affected in Maharashtra and MP respectively. This is also true for families affected and the land submerged

The SSP-NSP combined dams are planned to store 9 MAF of water for Gujarat. Thus, irrigation is primary and electricity is secondary, i e, it is a by-product. MP could have produced electricity at more favourable states, if it would have been given a free hand. Also, natural dam sites like Jalsindhi and Harinphal are lost due to submergence to MP whereas Navagam is not a natural dam site. This is a national loss.

The Narmada river is a intra-basin river for most of its length. It flows between Vindhya and Satpura ranges. Hence, Narmada should be used between Mahi and Tapi. It cannot be used for trans-basin purposes. This way it can only be used for irrigation purposes in the Bharuch and Baroda districts. Perhaps, it may irrigate at the most 4 lakh ha land. Thus Gujarat needs a dam to store at the most 2 MAF of water. For this, it can build a dam between Garudeshwar and Poicha. The dam height may be 100 to 150 feet.

Gujarat has no right to complain about MP or Maharashtra as long as the Narmada waters flow through Gujarat. During monsoon, Gujarat will easily be able to store 2 MAF of waters, because MP or Maharashtra cannot stop the flow of Narmada without spending fantastic amount of money. River waters going to sea is not a national loss. It is a natural eco-cycle and no one has right to stop it.

Indians have lived in arid regions for hundreds of years and they know how to survive there. There is no point in teaching them wrong methods of living. This is not to say that right type of modern technologies should not be used to remove their distress.

The government of Gujarat and the people of Gujarat are happy to see that the SSP dam is coming up fast and now it is a *fait accompli*. They are convinced that the dam can be built by brute force, repression and cruelty. It is a challenge now for ecologists, environmentalists, botanists, zoologists, all scientists and all sane and scientific tempered people of India to see that this dam becomes a grand monument to truth, compassion and justice. And, this can only become so by not allowing the mighty gates of this most sinister dam to be closed and impound waters to form a vast destructive reservoir. This is not an easy task.

The first point to be raised by the state and the central governments will be rhetoric. They will say: we have now spent Rs 20,000 to Rs 50,000 crore to build this dam. It cannot be a waste. That will not be in the national interest. The Supreme Court of India will endorse this stand by saying that this is the most valid argument. So the anti-dam activists will have no alternative but to accept the dam as a *fait accompli*. Are the anti-dam activists prepared to remind the central government that it was already warned by hundreds of eminent persons of this country to reconsider this SSP dam? Yet, the state government rushed to complete the dam in haste and hence should take the resulting consequences of the *fait accompli* philosophy. The natural beauty of this country and the lives of simple, innocent folks living in such surroundings cannot be saved by all kinds of compromises in the name of national interest. The fight is never against any dam but against the philosophy behind it, i e, brute force and cruelty. This is then the challenge.

All present day environmentalists and anti-dam activists should note that they are not the first to take up this challenge. Vishnois or Bishnois who live somewhere near Jodhpur in India took up this challenge long back and won against the might of Jodhpur Maharaja by quietly sacrificing 360 of them just to save their few trees. Even today, they have a beautiful habitat in the desert where deers and peacocks move freely around them without fear. There is a modest temple raised on the ashes of these 360 and it will do a great good to the spirit of modern ecologists to put two small flowers on this shrine.

DISCUSSION

Militant Left and Struggle for Democracy

Niranjan Phukan

THE *EPW* is an omnibus left journal that accommodates views of conservative bourgeois theorists as well as the ultra-left. This sometimes leads to confusion. An issue may editorially recommend some alternative economic policy in a certain sphere to the present government of India, while publishing a strident contribution by a radical leftist condemning in furious language any progressive expectations from the bourgeois state. The leftist thus feels happy to maintain the purity of his 'line' while loftily ignoring the obvious compromise with people holding quite different views. I believe this should induce the purists to do some much-needed and rather uncomfortable re-thinking on the Stalinist legacy, particularly in regard to the concept of the state.

I think there are two serious objections to the Stalinist view of the state prevailing among the militant Indian left. First, by assuming that it is merely an engine of exploitation and oppression impervious to outside pressures, it forecloses the possibility of effective democratic struggle in present-day Indian society, thus indirectly contributing to the growth of fascist tendencies of the state. Secondly, this assumption needlessly restricts the scope of activity of the left parties, confounding all democratic struggles on constitutional lines with parliamentary degeneration. Such a view also fails to account theoretically for the occasional but more or less effective use of bourgeois courts of law, media and human rights bodies by the ultra-left in their own interest. Dogmatic extremism does duty for thought that has to come to terms with a complex reality.

The purer the left the more minuscule its area of activity and influence, though of course it enjoys the unalloyed happiness of deductive theoretical rigour. Everyone else realises the historical obligation to form a united front of forces opposed to various forms of exploitation in our society and the despotic trends in the state. Such forces will necessarily include certain so-called 'revisionist' trade unions, reformist political parties, oppressed regional and ethnic groups, democratic intellectuals and certain sections of the middle class. Against them will be arrayed the opportunist alliance between the semi-fascist state and the motley armies of religious bigotry. To abandon the former option as a surrender to the class-enemy, as various militant left groups tend to do, will be to make the same mistake as Stalin who had indirectly helped the rise of Nazis to power by clubbing with them the social-democrats under the specious plea that social-democrats are 'only social-fascists'.

The genuine left, committed as it is to the politics of social transformation, will of course have to evolve and formulate a plan to lead the alliance to the path of struggle against reactionary forces. The struggle must avoid the complacency and unprincipled compromises of purely parliamentary politics, though it does not dogmatically boycott all participation in parliamentary politics. While it need not oppose all forms of violent struggle, it certainly cannot afford to endorse the line of armed struggle unconditionally.

Otherwise the united front will collapse, to the merriment of the fascists and reactionaries. One still awaits the proper formulation of such a strategy, along with the desired line in culture.

This is the point to discuss the vexed question of the use of the bourgeois state by the left. It has been argued that the bourgeois-democratic state in India is an empty shell, and that democratic rights and liberties are non-existent in India. This is an example of apriorism blind to empirical shades crippling the initiative of the militant left groups. To be sure, the influence of big capital, both global and Indian, is very strong on the Indian state. The social base of the latter contains feudal elements (e g, the role of caste in the administration and the courts of law) that nullify the democratic content of the constitutional rights. Further the bourgeois constitution itself is being progressively recast in an authoritarian direction by numerous amendments. Such an argument wishes away such facts as the removal and rescinding of certain amendments as a result of mass-movements, the struggle against centralising authoritarian tendencies by various regional forces and the occasionally effective though far from satisfactory uses of courts of law by militant forces against arbitrary arrests and detention without trial. While it is granted that the democratic content of the constitution in practice is small and dwindling, it does not at all follow that the democratic forces should therefore retire from the battlefield and allow the fascists and reactionaries to overwhelm the space for democratic politics.

Indeed the dangerous delusion that such forms of democratic mass-struggle are worthless has in practice weakened the democratic forces and armed the reactionaries. Among militant left and democratic groups such a notion leads to irresponsible terrorism and anarchism. In 1988-90 the notion that the Indian democracy is a farce encouraged the ULFA to indulge in a spate of murders of tea-garden managers, bureaucrats, marwari businessmen and political opponents from among the democratic camp itself. It used terror to proscribe all political and cultural work not in line with its adventurism. Eventually it issued death-threats to journalists who took a critical line in reporting their activities. Flamboyant lists of unfortunate villagers (very few of them landlords) under death sentence passed by it were regularly sent to the press. Such behaviour in the end so disgusted and enraged the people that when the state started a counter-offensive, considerable sections among the people kept silent. The ULFA had little political maturity, to be sure. But among its theoretical arsenal was the idiotic notion that there was no room between the bourgeois dictatorship and the dictatorship of the left. While I have no firm knowledge of what happened in Punjab I have a suspicion that the militants there were guilty of similar outrages. This is by no means to support state terror, but only to point out the contribution of adventurism to the consolidation of state terror and the decay of democratic forces.

The national oppression and exploitation underlined by the ULFA in Assam includes the oppression of indigenous small business and the suppression of small local enterprises by big capital. These sections of the people have a constructive approach to national development. When the campaign for national liberation is reduced to a programme of extortion and kidnapping and assassinations, this influential group has little reason to feel enthusiastic. Further, the contemptuous neglect of mass work among the peasantry and the labouring masses has dissolved the fragile links among the various ethnic, linguistic and religious groups, and paved the way to ethnic separatism. Thus a false theory has not only caused injury to the organisation but also endangered the people it would serve.

Hence there is a need to re-affirm the legitimacy of the term 'common man', against adventurist and anarchist subversions. The 'common man' is not the clerk on the Hero Honda, or the engineer with his VCR, as vulgar extremists prefer to believe, but the broad alliance of classes under the united front. Such a united front must work among other things for a transformation of the state with a continuous series of mass struggles maintaining as far as possible democratic norms. Democratic rights and liberties must be upheld and strengthened as weapons of the working people in their struggle for a better life. This is not to reduce the state to a jelly-fish, but to turn the state into an instrument of the people. Its coercive power must turn against religious bigots, communal terrorists, and exploitative landlords and profiteering businessmen. Of course such an outcome will be the achievement of a prolonged well-planned struggle. But that must be on the agenda first, in the teeth of immature and adventurist militancy.

SCHEDULE 17

NOTES FORMING PART OF THE FINANCIAL STATEMENTS FOR THE YEAR ENDED 31st MARCH 1994

1. The financial statements for the year ended 31 March 1994 reflect the results of the Indian Branches of The Hongkong and Shanghai Banking Corporation Limited ("the Bank"), which is incorporated and registered in Hong Kong. The Bank's ultimate holding company is HSBC Holdings plc, which is incorporated and registered in England.

2. Principal Accounting Policies

a) General

The accompanying financial statements are prepared on the historical cost basis as modified by the revaluation of certain premises, and in accordance with generally accepted accounting principles and the statutory provisions and practices prevailing within the banking industry in India.

(b) Transactions Involving Foreign Exchange

(i) Assets and liabilities denominated in foreign currencies are translated at the rates of exchange prevailing at the year end except for those foreign currency non-resident deposits eligible for conversion with the Reserve Bank of India, which are translated at the notional rates applicable to these deposits. Revenues and expenses are translated at the rates prevailing on the transaction date.

(ii) Outstanding forward foreign exchange contracts are revalued at the forward exchange rate prevailing at the year end and the resultant gain or loss is included in the Profit and Loss Account.

(c) Investments

(i) All investments are classified as "Current Investments" and are valued at the lower of cost and market value in aggregate by type of security.

(ii) Cost represents the acquisition cost adjusted by the amortisation of premium or discount over the period from the date of purchase to the date of maturity.

(iii) Market value for quoted investments is determined based on independent quotations and in the case of unquoted investments by reference to the market yield for instruments with comparable risk and residual maturity.

(d) Advances

Advances are stated net of provision for doubtful advances and interest in suspense. Provision for doubtful advances is made in respect of identified advances based on a periodic review and after having considered the provisioning guidelines issued by the Reserve Bank of India. Interest on doubtful advances is credited to an interest in suspense account and not recognised in the Profit and Loss Account until received.

(e) Fixed Assets

(i) Fixed assets are stated at historical cost less accumulated depreciation with the exception of premises which are stated at valuation or cost less accumulated depreciation.

(ii) Depreciation is provided on straight-line basis at rates prescribed under Schedule XIV to the Companies Act, 1956.

(iii) Depreciation on the revaluation of fixed assets is charged to the Profit and Loss Account and a correspoding transfer is made from the Capital Reserve to the Profit and Loss Account.

(f) Staff Benefits

(i) Provision for post-retirement benefits in respect of approved pension funds is made based on actuarial valuations conducted by a qualified actuary.

(ii) Pension payments to non-expatriate Indian staff who retired on or before 31 December 1980, prior to the creation of the approved pension funds, are accounted for on a cash basis. The annual cost of these pensions is Rs. 3 million.

(iii) Monthly payments made under the Voluntary Retirement Scheme introduced in 1992 are also accounted for on a cash basis. The liability at 31 March 1994 in respect of these schemes is

Rs. 10.1 million, provision for which is not made in these financial statements.

(g) Net Profit

The net profit disclosed in the Profit and Loss Account is after:

(i) provision for any depreciation in the value of investments;

(ii) provision for doubtful advances;

(iii) provision for taxation;

(iv) provision for other unusual and necessary expenses;

(v) charge for head office expenses.

3. Fixed Assets

(a) The most recent valuation of the freehold and long leasehold premises was conducted by independent professional valuers in November 1992 and the results of the revaluation were included in the Balance Sheet at 31 March 1993.

(b) Certain premises acquired under a Scheme of Arrangement are held in the name of Hongkong Bank (Agency) Private Limited, a wholly owned subsidiary, for the benefit of the Bank. Accordingly, these premises have been treated as assets of the Bank in these financial statements.

4. Investments

(a) Investments include securities of Rs. 23,850,000 which have not been transferred to the Bank's name. The Bank has filed an affidavit with the Custodian under the Special Court Ordinance, 1992 and awaits the Court's ruling. In the opinion of management, these securities will be transferred into the Bank's name thereafter.

(b) Investments include 110,760 Canstock Units of Rs. 100 each for which the Bank holds a valid Banker's Receipt from the counterparty. Physical delivery of the units is pending settlement of an unresolved issue, included under contingent liabilities, in respect of security transactions with the same counterparty.

5. Securities Transactions

The final Reports of the Janakiraman Committee, enquiring into the securities transactions of Banks and Financial Institutions in India were published in May 1993. Chapter XVII of the fifth Janakiraman report contains observations and criticisms of the securities operations of the Bank, notably deficiencies in the documentation of the client investment scheme and the imprecise basis on which the management fee was earned by the Bank in respect of the scheme. There were also references to the Bank's relationship with a broker through whom the bulk of the 416 transactions aggregating Rs. 43,909 million were entered into between 1 April 1991 and 31 May 1992, and to pay orders drawn in favour of the Bank which were credited to the broker's account, and to a number of transactions recorded as being with counterparties rather than with the broker.

There are certain securities transactions currently in dispute with the Bank involving an aggregate sum (including interest) of Rs. 1,030 million which are not acknowledged as debts by the Bank. In addition, the consequential taxation implications of the above transactions remain unclear. The Bank intends to defend itself against these claims vigorously. On the basis of information and advice currently available, management does not anticipate any material loss to the Bank.

6. Custodial Services

During the year the Bank introduced Custodial Services for securities, aimed mainly at Foreign Institutional Investors ("FII"). Unprecedented volumes generated by the overwhelming response from the FII customers led to a backlog in the process of transfer of securities. The backlog has since been cleared and the Bank does not expect any material claims to arise.

7. Taxation

Tax liabilities in respect of Mercantile Bank Limited taken over by the Indian branches are pending final outcome of the tax assessments/appeals filed by the Bank/Tax authorities relating to the assessment years 1967-68 to 1983-84 and those in respect of the Bank for assessment years 1984-85 to 1991-92. The amount is not ascertainable.

8. Previous year's figures have been regrouped and reclassified as far as practicable and wherever necessary.

Auditors' Report on the Financial Statements of the Indian Branches of The Hongkong and Shanghai Banking Corporation Limited under Section 30 of the Banking Regulation Act, 1949

We have audited the Balance Sheet of the Indian Branches of The Hongkong and Shanghai Banking Corporation Limited (incorporated in Hong Kong with limited liability) ("the Bank") as at 31 March 1994 and the related Profit and Loss Account for the year then ended. We have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our audit and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not drawn up, in accordance with Schedule VI of the Companies Act, 1956. The financial statements are therefore drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

In respect of the matters mentioned in Notes 4 (a) and 5 to the financial statements, we are unable to form an opinion on their outcome and consequently their effect, if any, on the results of the Bank for the year.

In our opinion, subject to the effect of the adjustments, if any, that might have become necessary had the outcome of the matters referred to in the previous paragraph been known, the financial statements give a true and fair view of the state of affairs of the Bank as at 31 March 1994 and of its profit for the year then ended.

We further report that:

(a) the financial statements are in agreement with the books of account and give the information required by the Companies Act, 1956, in the manner so required for banking companies.

(b) the Bank has maintained proper books of account as required by law insofar as appears from our examination of those books;

(c) the returns received from the branches of the Bank have been found adequate for the purposes of our audit;

(d) the transactions which have come to our notice have been within the powers of the Bank.

SCHEDULE OF NOTES ON ACCOUNTS FOR THE YEAR ENDED 31ST MARCH 1994

Significant Accounting Policy – Fee income is accounted on an accrual basis

No provision has been made in these accounts for income tax for the year as also for the earlier years as the income of this Company belongs to The Hongkong and Shanghai Banking Corporation Limited, the holding company, as per the Scheme of Arrangement approved by the Bombay High Court whereby the contractual obligation under the agreement dated 14 May, 1929, with Mercantile Bank Limited has vested in The Hongkong and Shanghai Banking Corporation Limited.

Contingent Liability in respect of (a) taxation matters Rs 104,000 (previous year Rs 104,000). (b) other matters – amount not ascertainable (previous year Rs Nil).

Other additional information pursuant to the provisions of the paragraphs 3, 4C and 4D of Part II of Schedule VI of the Companies Act, 1956, has not been furnished as there are no particulars to be given.

5. Trusteeship fees include Rs. 30,000 (previous year Rs. 30,000) in respect of companies where trust deeds are yet to be executed.

6. Earnings in foreign exchange – Fees Rs 10,162 (previous year Rs Nil)

7. The Company is in the process of running down the Trusteeship business as it is not remunerative. The Securities and Exchange Board of India (SEBI) has permitted the Company to continue with the existing Debenture Trusteeships until maturity, though the Company has not been registered as a Debenture Trustee under the SEBI regulations. The Company has decided not to accept any new Debenture Trusteeships as directed by SEBI.

8. Previous years figures have been regrouped wherever necessary.

AUDITORS' REPORT TO THE MEMBERS OF HONGKONG BANK (AGENCY) PRIVATE LIMITED

1. We report that we have audited the Balance Sheet of Hongkong Bank (Agency) Private Limited as at March 31, 1994, and the relative Profit and Loss Account for the year ended on that date, both of which we have signed under reference to this report.
2. In our opinion and to the best of our information and according to the explanations given to us, the Balance Sheet and the Profit and Loss Account together with the notes thereon, give in the prescribed manner, the information required by the Companies Act, 1956, and also give respectively, a true and fair view of the state of the Company's affairs as at March 31, 1994, and its profit for the year ended on that date.
3. We have obtained all the information and explanations which to the best of our knowledge and belief, were necessary for our audit. In our opinion, proper books of account have been kept as required by law so far as appears from our examination of the books and the above-mentioned accounts are in agreement therewith.
4. The Company is engaged in the business of supplying and rendering services. Accordingly, as required by the Manufacturing and Other Companies (Auditors' Report) Order, 1988 dated September 7, 1988, and issued by the Central Government and on the basis of such checks as we considered appropriate and according to the information and explanations given to us, we further report that:
   - i. The Company has not taken any loans secured or unsecured from companies, firms or other parties listed in the register maintained under Section 301 of the Companies Act, 1956, and/or from the companies under the same management as defined under sub-section (1B) of Section 370 of the Companies Act, 1956.
   - ii. The Company has not granted any loans secured or unsecured to companies, firms or other parties listed in the register maintained under Section 301 and/or to companies under the same management as defined under sub-section (1B) of Section 370 of the Companies Act, 1956.
   - iii. The Company has not granted any loans or advances in the nature of loans.
   - iv. The Company has not accepted any deposits from the public.
   - v. In our opinion, there is a system of internal control commensurate with the size of the Company and the nature of its business.
   - vi. The paid-up capital of the Company at the commencement of the financial year did not exceed Rs. 25 lakhs or the average annual turnover for a period of three consecutive financial years immediately preceding the financial year did not exceed Rs. 2 crores and as such we are not commenting on its internal audit system.
   - vii. On the last day of the financial year, there was no amount outstanding in respect of undisputed income tax, wealth tax, sales tax, customs duty and excise duty which were due for more than six months from the date they became payable.
   - viii. During the course of our examination of the books of account carried out in accordance with the generally accepted auditing practices we have not come across any personal expenses which have been charged to Profit and Loss Account, nor have we been informed of such a case by the management.
   - ix. The Company is not a sick industrial company within the meaning of clause (o) of Section 3(1) of the Sick Industrial Companies (Special Provisions) Act, 1985.
   - x. We have not reported on the matters contained in paragraph 4A(i) to (vi), (x) to (xii), (xiv), (xvi) to (xvii) in respect of fixed assets records and physical verification of fixed assets, revaluation of fixed assets, physical verification and valuation of inventories, internal control procedures relating to purchase and sale of goods, purchases and sales made in pursuance of contracts or arrangements entered in the register maintained under Section 301 of the Companies Act, 1956, unserviceable or damaged stores and raw materials or finished goods, records for sale and disposal of realisable by-products and scrap, cost records and provident fund and employees state insurance dues respectively as they are not applicable to the Company in respect of the financial year under audit.
   - xi. In view of the nature of services rendered by the Company, the matters specified in items (ii) to (iv) under paragraph 4(B) of the Order to the extent they relate to receipts, issues, consumption of materials and stores, allocation between materials and man-hours consumed, stores and labour authorisation at proper levels are also not applicable.

EAST WEST

TRAVEL & TRADE LINKS LTD.

Regd Office 2-4/8 Silver Apartments, Shankar Ghanekar Road, Dadar (West), Bombay - 400 028
Corporate Office Sophia, 18, New Kantwadi Road, Off Perry Cross Road, Bandra, Bombay - 400 050

Public Issue of 1,38,00,000 Equity Shares of Rs. 10/- each for cash at a premium of Rs. 30/- each aggregating Rs. 55,20,00,000.

Rs. 10/- on Application

India's Largest Private Airline & India's Largest Travel Agency.

HIGHLIGHTS

→ An established profit-making Company engaged in Travel Agency and Air Taxi Operations. Associate member of International Air Transport Association (IATA) → Well established and largest travel agency in India, familiar with airline industry with long-standing business relationships with several international airlines. Wide network of offices and agents all over the country for ticketing and allied services. → Largest Air-Taxi Operator in India, having more than 2 years experience of Airline operations. Presently operating to more than 25 destinations. Operations on major trunk routes, feeder routes and tourist destinations all over India → Established maintenance facilities, trained manpower, training and upgrading facilities. Own engineering set-up for maintenance facilities upto "C" check → Awarded "Best Inflight Service and Inflight Entertainment" award by JD Institute of Fashion Technology → Interline agreements for carrying international passengers on domestic routes with Air India and 17 other major international airlines. → Reservation systems managed by Gabriel II Computerised Reservations System based in Atlanta, USA. Global Marketing of services has been made possible through participation agreements entered with the major Computerised Reservation Systems in operation globally → Tax Benefits under Section 80I, and 80M of the Income Tax Act → Easy Liquidity listing at Bombay, Delhi, Cochin, Calcutta, Ahmedabad and Madras Stock Exchanges

"Investors may note that in case of oversubscription the allotment shall be on a proportionate basis and a SEBI nominated public representative shall be associated in the process of finalisation of basis of allotment."
"Investors are requested to refer to the para on 'Justification of Premium' before making an investment in the issue."
"The fair value of shares as per erstwhile CCI formula is Rs. 18.10 based upon 12% capitalisation rate."

RISK FACTORS

External → Air taxi service is subject to Government policies and guidelines. Any changes therein could have a bearing on Company's operations → Increased market forces on certain lucrative routes may have a tendency towards a price war → The Company may face competition from new private air-taxi operators → Break-even levels are high, which is typical of aviation industry

Internal → Winding up petition has been filed by creditors viz. M/s PLM Equipments and Bank of Utah in Bombay High Court → Assistant Collector of Customs (IATT) had issued show cause notice for payment of Rs. 1428.32 lakhs towards inland travels tax for the period March 1992 to February 1993. In pursuance of the above a demand of Rs. 968.61 lakhs and penalty of Rs. 300 lakhs has been made → The Income Tax Department has raised demands for Rs. 54.13 lakhs for A. Y. 1990-91, Rs. 392.96 lakhs for A.Y. 1991-92 and Rs. 35.85 lakhs for A. Y. 1992-93 → The Company has overdrawn balances aggregating Rs. 10.67 crores in the Consortium Banks Accounts, out of which Rs. 3.24 crores is due to overdue interest → Estimates of capital expenditure to be incurred are based on the Company's past experience/enquiries made, the Company is yet to obtain quotations for equipment → The Company, on the basis of the past experience and inventory levels, has estimated Rs. 5973 lakhs as total working capital requirement of the Airline Division as against Rs. 4901 lakhs assessed by the Consortium of Banks led by State Bank of India.

Management Perception • External → To cope with increased demand of domestic air travel and to give boost to tourism, Government's policies are expected to be favourable to Air-Taxi Operators → Price war, if any, may not be a long term phenomenon → The Company being the largest and most experienced air taxi operator with comprehensive maintenance base and well trained manpower along with widely distributed network of ticketing, travel agency and allied services will be in a better position to meet the competition → Already established airline operations will enable the Company to achieve the projected load factors.

Internal → Payments of lease rental has been ongoing and regular activity for the last 2 years. The Company has disputed the Statement of Accounts sent by PLM Enterprises regarding amounts claimed by way of legal charges and political risk insurance and interest alleged on the above outstanding charges, which do not fall within the provisions of the agreement between the Company and the PLM. It may be mentioned that the authorities in India are not in favour of allowing insurance cover against political risk which tantamounts to acknowledging political instability in the country. It appears that the Company's refusal to make payments in excess of the agreed lease rentals has prompted foreign lessors to resort to pressure tactics at the time of the Company's forthcoming public issue. The Company has not been served with winding up petition notice. The Company would be entitled to file their reply and oppose the admission of the winding up petition when the notice of the petition is given to the Company. The Company has also taken up the matter with the lessors and based upon the initial round of discussions it is confident that the winding up petition will be withdrawn. It may also be noted that compared to the size of operations of the Company and its networth the disputed amount of about Rs. 2 crores is not material to have effect on its operational and overall viability → The Company has challenged the legality as well as the correctness of the show cause notice of the Assistant Collector of Customs, New Delhi by filing a writ petition in the Delhi High Court. The Company has Interline Agreements with 18 international airlines. It carries a substantial number of passengers, who undertake inland journey as a part of their international journey. This category of passengers is exempted from payment of IATT. The Company also claimed exemption from payment from IATT for its employees carrying inland journey as part of their duty or on leave on the ground that employees of Air India, Indian Airlines are enjoying these benefits. The Company is filing an appeal to the Collector of Customs (Appeals), Indira Gandhi International Airport, u/s 11 of the IATT rules 1989. The Company has provided Rs. 273.46 lakhs against IATT dues payable to customs authorities for the period March 1992 to February 1993. Additionally by an interim arrangement with the Revenue Authorities, the Company has been forwarding monthly statement of IATT Returns since 1st April 1993 and making regular payments on the same basis. In case of any contingent liability being materialised the cash flows in future years will enable it to fulfil the same → Income Tax appellate authorities have passed order for 1990-91 in the Company's favour giving substantial relief. The demand in 1991-92 is mainly on account of disallowance of handling charges which was decided in the Company's favour in the previous year. The Company is therefore confident of getting substantial relief against 1991-92 demand. Rectification application u/s 154 to income authorities for 1992-93 has been made → The overdrawn balance is on account of shortage of working capital funds faced by the Company due to increase in size of operations and typical requirement of aviation industry. The Company has applied for temporary accomodation to the Consortium of Banks.

NOTE: Investors may note that the maximum size of single application under net public offer is restricted to 4,25,000 shares aggregating Rs. 170 lakhs or application money of Rs. 42.50 lakhs.

In Transition

Competition for capital between states is necessary for the system to reproduce itself but so is the need for order. Hegemony is the process through which that equilibrium is established. In the past hegemonic transitions have been associated with dramatic crises and wars. Will these occur again now when old regimes and institutions are being transformed out of recognition, replaced and reconfigured? **PE-86** The ongoing recession and the crisis in the Canadian economy appear to be the outcome of a cumulative impact of structural maladies in the economy because of a particular development strategy it adopted which engendered a vicious circle of dependence. **PE-80** Is the unequal relationship between the capitalist class in the advanced countries and the capitalist class in countries like India an exploitative one, in the sense that there is an extraction of surplus value from the weak to the strong? **PE-60** Where did the 'dependency theory' go wrong? Is the theory of 'unequal exchange' false? What is driving India towards globalisation? Is it possible to construct a theory with elements from the contributions of Kosambi, Mahalanobis and Myrdal on India, which will illuminate the present complex reality of contradictory forces in all three spheres, the economic, political and religious? **PE-70** The difficulty of putting Marx within the neoclassical framework is that while the former tries to understand the reality with a view to changing it, the latter gets involved with the rationality of arrangements and behaviour, giving an impression of rationalising the system. **PE-65** When Marx wrote his first critique of political economy 150 years ago, he was aware that communism, while emancipating the immediate producers in the first place, is in fact a project for total human emancipation. The solution of the contradictions engendered by alienated labour is an eminently practical task, not of knowledge alone. **PE-54**

Restructuring 'Debt'

The Russian proposal to auction rupee funds representing debt repayment to Russia and investment of these funds in equity capital in India raises new issues in Indo-Russian economic relations.

Factory and the State

Working conditions in the jute mills seen within the triangular structure constituted by the colonial state in India, the Anglo-Scottish management of the mills in and around Calcutta and the labour force employed provide insights into the crucial role the colonial state played in establishing the factory system in the colonies. **1994**

Understanding a Fall

A retrospective critique of the theories of the Soviet system provides some insights into the larger implications of the collapse of a unique socio-economic and political system. **2036**

A New Ball Game

The World Cup USA was a game of the New World Order played according to the rules and norms of globalisation. **1996**

Ecology and History

While there is a burgeoning interest in exploring the history of people's struggles over ecological issues, we still lack a framework for systematic study of ecological history. **2006**

Extending Boundaries

A large part of a human being's dialogical experience is spent in realms outside available institutional arrangements. Political theory needs to comprehend these realms. **2011**

Productivity Growth

Contrary to general assumption, productivity growth in the 1980s may actually have been slower than in the earlier decade. **2028**

Lajja and Language

People for whom modernity is essentially a west-of-Khyber phenomenon will find it difficult to understand that Tasleema Nasreen's *Lajja* raises, in the last analysis, issues of language, not theology. **1998**

Counterfeit Renaissance

M S S PANDIAN's piece (June 25) has no iota of fact in its contents. Originally, V Gopalsamy faced various problems from the high command. Gopalsamy was very loyal to the high command and to Karunanidhi. Due to his sincerity and honesty in public life, he is respected by DMK cadres especially youngsters. Therefore, Karunanidhi's son Stalin could emerge as leader of DMK. Under these circumstances, Karunanidhi and other second rank leaders loyal to his family tried to install and project Stalin as leader next to Kalainagar. But they failed in their attempts. Finally, Karunanidhi met the press and released a letter stating that the LTTE was going to assassinate him to promote Gopalsamy in DMK party. This was meant to isolate Gopalsamy from party cadres. This calculation also misfired. After that Gopalsamy convened the general council at Trichy. A number of genuine DMK cadres and leaders attended the council. Unfortunately, due to some reasons, Gopalsamy was forced to name his party as Marumalarchi DMK.

Honesty in politics, purity in public life and consistency in principles are the major slogans of MDMK. Nowadays, politics is in a bad shape without honesty, purity and principles. Hence the MDMK's principles will pave the way to healthy politics. The MDMK respects various faiths which are adopted by the general public in good spirit and good sense. Therefore, there is no question of criticising religious points of view. MDMK is against the theocratic domination and it has raised its voice for secularism in the democracy. I deny that Gopalsamy is not following the footsteps of M G Ramachandran. We have our own role to play in politics in the footsteps of Anna

K S Radhakrishnan

Madras

Triple 'Talaq'

GAUTAM NAVLAKHA (May 21) has unnecessarily mixed up many issues and thus lost the thrust of the point he wanted to make. Not just me but most of the Hindu, Muslim, Sikh and Christian women students here have admired justice Tilhari's unique judgment declaring the reciting of talaq at one sitting as unconstitutional. Justice Tilhari is capable of pronouncing controversial judgment if it helps a cause and brings some social changes. The judges of the Supreme Court normally go by the evidence and constitutional point placed before them. Thus Tilhari's judgment on demolition of Babri masjid should not be compared with the triple talaq because in the earlier case a controversial building was involved while in the case under discussion a human/woman's life is involved. Let us keep politics away from this issue.

The judgment has certainly highlighted the sad plight of Muslim women in India if Shariat supports such an unreasonable custom—a review is necessary in the light of outlawed system of talaq in Pakistan, Syria, Libya, Algeria, etc. Many probably do not know that before talaq is uttered thrice in one sitting the woman is kept under tension causing physical and mental harassment. She is forced to accept what is impossible. In this context it is important to remember Bangladeshi woman writer Taslima Nasreen who says that the laws must be enacted to forbid Muslim men to marry four times, about custody of children of divorced parents and deprive women of an equal share of family inheritance. They must accept family planning.

The article gives an impression that it is no surprise if Muslim women suffer because the plight of Hindu women is no better. Since both are governed by different social customs and laws of the land, the comparison is not logical. In case of Hindu women laws are not made effective but Muslim women suffer because there was no protection from courts.

New Delhi

Just Politics

'SECULARISM, Modernity and the State' (July 9) has documented excellent concepts and ideas about secularism. However, since secularism has become a part of politics rather than of our society, it is not being taken seriously by the common man. It has, to my mind, become a myth rather than a reality even for politicians and intellectuals who demonstrate ever increasing concern for secularism.

Ironically, there is no acceptable (I mean universally acceptable) definition or concept of secularism. Is it necessary to have no faith in any religion to be recognised as a secularist? As long as we do not curb the hate-Hindu and the hate-Muslim hysteria, how can one promote secular feelings? Hindutva is an ideology of the affluent class and the amount of effort and money that is being spent to promote it is significant. The Muslim community, on the other hand, spends much less in terms of money but more in the form of propaganda and effort to promote anti-Hindu feelings.

The occasional eruption of militancy in J and K and the government propaganda that Pakistan is engineering trouble in the border states act as slow poison against secular efforts. Modernity and democracy in India are a blend of traditions and caste. Secularism is not a driving force.

At times, I wonder if only BJP-RSS, VHP-BD-SS are to be branded as anti-secular parties. The sad economic and social status of Muslims in India in the last nearly 50 years, which have been dominated by Congress Party rule, is enough to show how little has been done to improve their plight.

I wish the articles in this issue of *EPW* could have paid a little more attention to the down-to-earth reasons instead of discussing the issues at such a level of abstraction that not many students even in universities would be able to understand the discussion. Showing concern for Hindus and/or Muslims is now little more than politics.

A Reader

New Delhi

ECONOMIC AND POLITICAL WEEKLY

Missing Quotient

WHAT is the finance minister up to? Is he trying to prove that his brand of economic liberalisation and globalisation cannot succeed without unlimited recourse to political cynicism and amorality? Was it really necessary for him to come out publicly in support of the Maharashtra chief minister and damn his critics, whose charges of corruption and abuse of power against Sharad Pawar have in the last few weeks evoked an unprecedented popular response, as "forces of destabilisation"? The finance minister's intervention, hailing Pawar for having "done us proud", was altogether gratuitous, since the occasion, a talk on the Indian economic scene in Bombay last week, definitely did not call for it.

And then comes, this week, the government's so-called action taken report on the findings of the Joint Parliamentary Committee on the stock market scam. The report, prepared in the finance ministry and piloted by the finance minister through the cabinet committee on economic affairs, smacks of the same lack of the "moral quotient, of a common sense appreciation of right from wrong" which, according to the JPC, had characterised the whole system which had spawned the gigantic fraud in financial and stock market transactions. The tone as much as the content of the report has provoked the otherwise splintered opposition in parliament to take a common stand which, it is beginning to look at the time of going to press, may in the end force the government to eat humble pie. So lackadaisical has been the government's attitude and so inadequate the action so far against those acknowledged to be involved in the scam that the opposition would have had enough to go to town over anyway, especially the continuance in the council of ministers, though with changed portfolios, of the two ministers, B Shankaranand and Rameshwar Thakur, who came as close to being indicted in the JPC report as anyone possibly could. But by choosing to go on the offensive and attempting to dismiss out of hand the JPC's observations on its own conduct in dealing with the scam, the finance ministry has managed to stir up hornet's nest, involving the question of the privilege of parliamentary committees and of parliament itself.

The JPC's observation that the finance ministry had failed to anticipate the scam and respond to it effectively after it had surfaced is dismissed as "unwarranted" and "unfair". The criticism of the ministry for its failure to deal adequately with the consequences of the scam and apply the needed correctives is held to be "unjustified". It is asserted that "it is not correct that the finance ministry during the stewardship of the present government was lacking in its intention and willingness to take necessary action both in anticipation of the scam and subsequently". The JPC's adverse comments against the then minister of state for revenue, Rameshwar Thakur, for delaying action on an urgent income tax file dealing with Harshad Mehta are rejected with the observation that "a careful examination of the facts shows that the delay in no way affected the progress of investigation or compromised any course of action". On the partiality of the then petroleum minister, B Shankaranand, to investing the Oil Industry Development Board funds under his control in Canfina and Syndicate Bank, from where they flowed as intended to Harshad Mehta, the report finds that "on the basis of record" the charge of "preferential treatment at the hands of the OIDB to some institutions is not borne out". Even when it makes a rare concession that there may have been "inadequacies" in the supervisory machinery of the Reserve Bank, no action is really called for as the then governor, one of the deputy governors and another senior official, held responsible by the JPC, had since "retired from the Bank".

The problem is a basic one. It has to do with, in the JPC's words, the lack of an "appreciation of right from wrong". Just as the finance minister is ready to dismiss the Maharashtra chief minister's detractors as engaging in "destabilisation", he no doubt regards the JPC and those who take its report, already more than half a year ancient, seriously and, what is worse, expect it to be acted upon, as obstacles in the way of his efforts, as he once chose to put it, to "release the entrepreneurial spirit and animal energy of our businessmen, industrialists and entrepreneurs to create wealth". Among such, unfortunately for him it turns out, are a not inconsiderable number of the people's representatives in parliament, including perhaps some from his own party.

EDUCATION

Where Are the Teachers?

DOES anyone in this country worry at all about the problems of education? The constitutional deadline for the introduction of universal and compulsory primary education has been passed many times. Yet neither the union government nor any of the state governments is ready to take any major or decisive steps in the matter. Even those political parties which are habitual breast-beaters about the poor and the downtrodden have shown no greater sense of purpose when in power. Only a few months back, it was reported that the Janata Dal government in Bihar chose to leave some 10,000 school teachers' positions (meant for women teachers, at that) unfilled because of the apprehension that most of these jobs would be gobbled up by high caste women.

The present is in many respects a very opportune time for a major expansion of primary, secondary and adult education in the country. The vocationalisation of the higher secondary (plus 2) stage having proved a non-starter and with near-stagnation in the industrial and agricultural job market, the country is facing an ever growing army of educated unemployed, which can very easily be channelled into the teaching profession.

To expand primary education, it is first necessary to ensure an adequate supply of trained teachers—high school pass-outs with a diploma in education (D Ed)—and to have them in sufficient number, it is necessary to have a large number of high school teachers, graduates with a degree in education (B Ed). It is true that high school and college education has expanded in the past few decades (almost entirely on the basis of non-official initiatives). But there has been no commensurate increase in teacher-training facilities in the country. Take the case of Maharashtra. It would be safe to say that the available teacher-training facilities in Maharashtra are insufficient even for the normal replacements and additions in the school system. The result has been the recruitment of a large number of untrained persons as teachers. Since a teacher is normally confirmed/promoted only if he or she is trained, one finds a large number of teachers working year after year as temporary hands. Needless to say, at least some of the private school managements find this arrangement extremely profitable.

Even though there are some half-a-dozen government or government-aided institutes, teacher education in Maharashtra has come to be dominated by scores of private institutes controlled by politically influential promoters. They are run mainly as business ventures and are sustained by the fees collected, without any aid from the government. One may naively assume that they would surely be interested in increasing the number of seats, but this is not so. Because of the quick, handsome and invariably unaccounted gains that can be had because of the scarcity of seats, they have no interest in creating additional seats: a classic example of profiteering in a scarce commodity. Moreover, a majority of these promoters are also locally influential political activists and controlling school/college admissions is one standard lever of power in local politics. Their influence in the organs of state has always been exerted in favour of *not* increasing the number of seats.

The actions and the inactions of the government of Maharashtra have clearly failed the cause of mass education. At the same time, they have resulted in creating ample room for malpractices which are fully utilised by the more enterprising managements. They have also caused a build-up of frustration among the young entrants in the teaching profession.

The drift of government policy is easily explained, because by and large the very individuals who are making a neat killing under the present system are also the decision-makers in the state and the local administrations. The situation which was bad enough till last year has considerably worsened since June 1994 because of (1) the increase in the seats reserved for the 'deprived sections of the society' to 50 per cent, and (2) the government's latest decision to reserve seats not only castewise but also regionwise and districtwise, exempting only minorities-run institutes from most of these restrictions.

The cumulative effect of the various regulations has been a plethora of representations, complaints and law suits, with students running from pillar to post searching for admission, while those who are cashing in on the continuing scarcity of 'open' seats are happier than ever before. The latest regulations have added enormously to the pent-up anger of the student community and the public, but one may safely predict that until it bursts out in some ugly form, the government will continue its present policies.

ANTI-POVERTY PROGRAMMES

Leakage as Excuse

DURING his one-day visit to Thiruvananthapuram, finance minister Manmohan Singh made a number of observations worth noting. Speaking to local industrialists, he chose to address all the state governments. If the states want more private sector investment to come to them, it is their responsibility to create conditions for such investment to flow in. The finance minister's observation was particularly significant in Kerala's context because it has been the state government's case that the state has lagged behind in development of economic infrastructure largely because of the neglect it has suffered at the hands of the centre, both directly and indirectly: directly because the state has not been receiving its due share of central sector investments and indirectly because in the financial devolutions through the Finance Commission and the Planning Commission Kerala's case for support in building up its economic infrastructure has gone unheeded.

Just a week or so before the finance minister's visit to the state, its chief minister, K Karunakaran, who loses no opportunity, to impress upon his people what enormous clout he enjoys with the powers that be at the centre, had announced that the centre was agreeable to investing as much as Rs 23,000-crore in the state. Manmohan Singh made no such commitment. If anything, his observations had a clear message for the state, namely, the centre had little money to put into the state's economic infrastructure. If the state government wants to make up for what it failed to do in the past, for whatever reason, it has now to create conditions for the private sector to come in and help the state overcome its weaknesses in regard to its economic infrastructure.

This links up in a way with Manmohan Singh's observations to a different audience during his visit. This time he was addressing a meeting organised by the local university's economics department. There he conceded that anti-poverty funds did not always reach the target groups; the leakages were enormous, he acknowledged. Of course, this is not anything new, but coming from him, it could not be without some purpose. True, he would like to keep the budget deficit low, not only because he feels committed to his target, but also to contain inflation which is showing no signs of relenting. But does he have to achieve his deficit reduction target at the expense of the poor and the states? Coming as it did from Manmohan Singh, the statement creates the strong suspicion that he might be preparing the ground for backtracking on the financial commitments he made so much of while presenting his budget for the current year.

So not only is the finance minister telling the states that the centre has no funds to commit for investments in their economic infrastructure, but he is also trying to create a climate of opinion in which poverty alleviation programmes can be done away with, not because poverty has disappeared, but because the programmes are not making any impact.

RELIGION AND POLITICS

Who Is a Fundamentalist?

E M S NAMBOODIRIPAD has evidently raised a hornet's nest with his recent comments on fundamentalism. Even his own party is trying to dissociate itself from his characterisation of Gandhi, Tilak, Azad and Ghaffar Khan as fundamentalists. Indeed the party general secretary is reported to have publicly reprimanded the savant.

But is not the subject of fundamentalism something worth probing? Are we clear about what it really stands for before we decide whether it is indeed a dirty word as it is being made out to be? What Namboodiripad had

done is to ask precisely such questions. If 'religious fundamentalism is the approach of subordinating everything else to religion", he wrote in his *Frontline* column, "all devout followers of all denominations of religion are fundamentalists". And that would include 'the tallest leaders of India's freedom movement".

Having said that Namboodiripad drew a distinction between those "who were religious fundamentalists in their personal beliefs and practices but subordinated every aspect of their philosophy to the requirements of the nation's anti-imperialist struggle" and Jinnah who, without being a religious fundamentalist in the above sense, made use of religion to lead "a separatist communal movement".

Obviously, if the term 'fundamentalism' is to be employed only in the sense of the use of religion for anti-national or separatist purposes regardless of whether the perpetrator himself or herself is a particularly devout follower of religion, it is a very special meaning we shall be giving the term. In fact, the question can well be asked whether a person like Jinnah has necessarily to be called a fundamentalist to bring out what he did.

The question does remain whether Gandhi or Tilak could be called a fundamentalist on the grounds that (a) he was personally an intensely religious person and (b) he did invoke religion and religious symbolism for mobilising political opinion in the struggle against colonial rule. The answer boils down to what fundamentalism is meant to stand for.

Can we overlook in this context that the much-abused term came into prominence in the western press in the context of the struggle in Iran to be rid of the imperialist yoke. Ayatollah Khomeini, who led this struggle, was an intensely religious person—indeed he was the country's top cleric—and used religion to the full to wage his battles. And the western press continues to speak of him as if he was the foremost fundamentalist of the century. If Gandhi were alive when Khomeini was waging his battles, would he have distanced himself from Khomeini, the way some people are blushing over Namboodiripad referring to Gandhi as a religious fundamentalist and in the same breath as one of the tallest of the leaders of the freedom struggle?

There are some who would accuse Namboodiripad of ulterior motives for provoking the debate. Perhaps, this is so. But have the accusers, the louder ones among them especially, no ulterior motives themselves? Who is interested in the basics?

FOOD

Redefining Undernutrition

A correspondent writes:

ACCORDING to the just released report on the *State of World Population*, the world's food production has increased by 24 per cent in the last decade, but very unevenly with an estimated 780 million who may be undernourished living in developing countries. There is thus, the report points out, no global shortage of food, but inequitable distribution. "Poverty", says the report "in effect translates global adequacy into national and local shortages", including intra-family maldistribution. While the solution is to strengthen inputs into the agricultural sector which provides employment to the majority in most developing countries, the other larger objective is obviously to work towards limiting population growth. The first option, investing to provide employment, is clearly out in the context of structural adjustment programmes which generally accord preference to investing in increasing productivity in sectors which produce goods for global consumption, rather than create employment. Nor is the redistribution of incomes (or food resources) even a remote possibility in the current context. The solution is therefore to re-examine the issue of what is adequate food.

Not surprisingly, the issue has exercised many minds and institutions over the decades. It is certainly more than a matter of biology. A new study on how third world rural households adapt to dietary energy stress prompts the question if political and ideological considerations do not often overwhelm and distort the understanding of food and energy requirements and how to measure them. The study contends that the starting point for such an enquiry should be to look at strategies communities use to "avoid, repartition or resist, or tolerate undernutrition" so that policy-makers "can allocate scarce nutritional and health resources in the public domain effectively". This has prompted the group to see, for instance, that size and stature by themselves do not prove a lack of low inputs over generations, but show that by natural selection, the size and stature obtained are indeed the most efficient in terms of making the best use of available nutrition. Since size changes are adaptive for survival and a community under nutritional stress will select tasks which are suitable to small people, policy-makers should play a part in ensuring that the earning capacity and employment in these "small people's tasks" are advanced.

Another set of conclusions relates to food requirement of women during pregnancy. On the basis of evidence from a Nestle Foundation-sponsored study in five populations which suggests that metabolic efficiency increases during pregnancy, the group concludes that the energy requirements in pregnant women suggested by WHO/FAO in 1985 "if 'implemented', could needlessly transfer food from pre-schoolers who require it more or map pregnant women into obesity or both". Whatever scientific expertise may have gone into such reviews and studies, they are not, it must be remembered, free from a variety of biases. And the worst of these is to be blind to the growing social distress and disruption that poor communities are being subjected to in the absence of adequate food. Altering the definitions of what is adequate is hardly the right solution.

WORLD BANK

'Managing Poverty'

Michel Chossudovsky writes:

'SUSTAINABLE poverty reduction' under the dominion of the Bretton Woods' institutions is predicated on slashing social sector budgets and redirecting expenditure on a selective and token basis 'in favour of the poor'. The 'social emergency funds' established (on the Bolivia-Ghana model) in developing countries and eastern Europe are intent on providing 'a flexible mechanism' for 'managing poverty' while at the same time dismantling the state's public finances. In Sub-Saharan Africa, 'targeting' in favour of so-called 'vulnerable groups' has largely been responsible for the collapse of schools, health clinics and hospitals, while providing a semblance of legitimacy to the Washington-based institutions. Freezing the number of graduates of the teacher training colleges and increasing the number of pupils per teacher are explicit conditions of World Bank social sector adjustment loans. The educational budget is curtailed, the number of contact-hours spent by children in school is cut down and a 'double shift system' is installed: one teacher now does the work of two, the remaining teachers are laid off and the resulting savings to the treasury are funnelled towards the Paris Club of official creditors. These initiatives (implemented in the name of 'poverty alleviation'), however, are still considered to be incomplete: in Sub-Saharan Africa, the donor community has recently proposed a new imaginative ('cost-effective') formula which consists in eliminating the teachers' meagre salary altogether (in some countries as low as 15-20 dollars a month) while granting small loans to enable unemployed teachers to set up their own informal 'private schools' in rural backyards and urban slums. Under this scheme, the ministry of education would nonetheless still be responsible for monitoring 'the quality' of teaching.

A similar approach prevails in the area of health: state subsidies to health are said to create undesirable 'market distortions' which 'benefit the rich'. Moreover, according to the World Bank's recent 'estimate' (contained in its *World Development Report 1993* titled *Investing in Health*), an expenditure of eight dollars per person per annum is in any event amply sufficient to meet acceptable standards of clinical services. User fees for primary health care to impoverished rural communities should be exacted both on the grounds of 'greater equity' and 'efficiency'. These communities should also participate in the running of the primary health care units by substituting the qualified nurse or medical auxiliary (hitherto paid by the ministry of health) by an untrained and semi-illiterate

health volunteer. The results: with the exception of a small number of externally funded 'showpieces', health establishments in Sub-Saharan Africa have *de facto* become a source of disease and infection. The shortage of funds allocated to medical supplies including disposable syringes, as well as the price hikes (recommended by the World Bank) in electricity, water and fuel (e g, required to sterilise needles) increase the incidence of infection (including HIV transmission). The recent devaluation of the CFA franc imposed by the IMF and the French treasury, rather than constituting 'a means of eradicating rural poverty' as claimed by the donor community, compresses (with the stroke of a pen) the real value of wages and government expenditure (expressed in hard currency) by 50 per cent while massively redirecting state revenues towards debt servicing. The impact of devaluation is brutal and immediate: the domestic prices of food staples, essential drugs, equipment, etc, have skyrocketed. It is worth recalling that in Nigeria in the 1980s, the steep price of soap which resulted from the devaluation of the naira was the cause of a high incidence of certain types of skin disease.

There is little to rejoice about as the international community commemorates the 50th anniversary of the Bretton Woods Conference. In anticipation of this event, some critics have intimated that because the World Bank is entrusted with 'poverty alleviation' and 'the social safety net', its approach is more palatable and 'humane' than that of its sister organisation. In addressing this issue, it should be emphasised that there is a well thought-out 'division of tasks' between the two institutions, both of which are bureaucracies accountable to powerful financial interests as well as to the governments of the G-7 countries. Moreover, while the role of the IMF often appears to be politically decisive and unyielding, the World Bank through its resident country office and its numerous technical missions (which directly oversee the activities of line ministries), is far more engrossed in the 'routine' policy mechanics of economic and social destruction.

WEST ASIA

Flank Attack

PANEGYRISING the signing of the Washington accord between Israel and Jordan last week the US president said that the vibrations sent out by the event had prompted the Russian decision to withdraw troops from Estonia, bringing an end to the presence of Russian troops in eastern Europe. Vibrations the accord has certainly caused, but hardly of the kind that the US envisaged or anticipated in west Asia. For it is more than likely that Jordan's anxiety not to be left out of the peace process and the benefits accruing from it has caused it to take steps which may delay if not derail the west Asia peace process.

The accord between Israel and Jordan comes after 46 years of conflict. It includes an agreement between the two neighbouring countries on such issues as a resolution of border disputes, a survey of border posts through a boundary subcommission, negotiations on water resources ensuring equitable allocation of the water of the Jordan and Yarmuk rivers, abolition of economic boycott and the establishment of bilateral economic relations and of power and telecommunication links and the initiation of negotiations towards creating an air corridor between the two countries. The accord also ensures that Israel will give "high priority" to Jordan's historic role in guarding the holy sites of Jerusalem. Or in other words, Israel has virtually assigned to King Hussein custodianship of the Al-Agsa shrine in East Jerusalem. Israel's argument is that the king has been financially supporting the Muslim high council which administers the shrines and that, in recent years, has even given $ 10 million towards the coating of the dome of the mosque with gold.

The Palestinians, however, point out that the status of Jerusalem had not been decided upon under the PLO-Israel agreement signed last year. Israel therefore had no right to allocate responsibility over any part of Jerusalem to anybody unilaterally. While Arafat has officially welcomed the declaration, several authoritative Palestinian sources have denounced the assigning of authority to Jordan over any part of Jerusalem. The anxiety of the PLO that Israel by apportioning authority over Jerusalem is moving towards consolidating its own authority over the disputed area is not misplaced. For some time now Israel has been mooting the idea of having a multi-religious authority to oversee the Christian, Islamic and Jewish shrines in Jerusalem, which would make it possible for it to retain control over the area. If Jordan is well disposed towards such a dispensation, then it is likely to tilt world opinion towards such a move.

That Jordan would agree to what appears to be a circumventing of the September agreement between Israel and the PLO is not surprising. With the signing of that accord, Jordan found its political and economic role in west Asia vastly diminished. Moreover, the fall of the value of the Jordanian dinar, the main currency in the West Bank and Gaza after Palestinian autonomy became a reality, caused speculation about Jordan's economic future. Given these conditions, Clinton's offer that he would press Congress to write off Jordan's $ 700 million debt to the US was just the bait needed to persuade King Hussein to initiate the peace process with Israel. In the circumstances, it would not at all be surprising if once again the PLO becomes isolated. However, today unlike in earlier times, the PLO may well be forced to make further compromises.

TWENTY YEARS AGO

EPW, July 27, 1974

The government has been talking of a package of anti-inflationary measures, which it is unwrapping bit by bit. Of the measures announced so far, only the ordinance impounding increases in wages and dearness allowances can be expected to have an impact, though this impact will be felt more in terms of hardship caused to salary and wage earners than of any perceptible effect on the inflationary situation. The other measures—the restriction on dividend distribution by companies and the compulsory deposit scheme for income-tax payers with annual incomes of Rs 15,000 and above—are obviously intended to deceive salary and wage earners, and their trade union organisations, into believing that the rich are being made to share the burden of fighting inflation.

Even as the government has made much of so-called measures which have either nothing to do with inflation or are of peripheral significance, all is quiet in the one area in which action could have a swift and sharp impact on inflation—controlled distribution of the basic necessities of life. Instead, in this area there has been a marked regression. For instance, the scale of operation of the public foodgrain distribution system has been slashed to less than one-half of what it was around this time last year. The prime minister has talked soothingly of large quantities of foodgrains, mainly wheat, which are proposed to be imported this year. What is forgotten is that, as far as public distribution is concerned, these imports will barely make up for the government's dismal failure to procure foodgrains internally. An idea of the shape of things to come can be had from the announcement that the Maharashtra government is considering a further cut in the foodgrains ration quota in Bombay so as to increase supplies to the rural areas where, according to representations received by the government, the availability of foodgrains through the fair price shops is "almost nil"!

***

In spite of having one of the largest scientific communities in the world, choosing chief executives for scientific organisations has always been a vexing problem in this country. Whenever a vacancy arises or a new programme is initiated, the choice again and again narrows down to a select few. These few invariably already hold other positions of leadership. The latest example is the appointment of M G K Menon as Scientific Adviser to the Ministry of Defence, Director-General of Defence Research and Development, and Secretary to the Government of India. Menon, it is reported, will continue as Secretary to the Government in the Department of Electronics and Chairman of the Electronics Commission, though he has kindly consented to give up the post of Director of the Tata Institute of Fundamental Research. This decision of the government is unfair to R and D programmes in both Electronics and Defence. Both need full-time chief executives because they are critical to the country's development, are of large size, and are different from each other. One person, however gifted he may be, cannot devote enough attention to the two organisations. As a result, both Electronics and Defence R and D will suffer for want of leadership and timely decision-making.

Savita Chemicals

SAVITA CHEMICALS (SC), a 33-year-old flagship company of the Rs 100 crore Savita group, which was initially engaged in refining liquid paraffin from semi-finished base stocks, is today a front-runner in the development of petroleum speciality products in the country having a product range catering to a diverse group of industries like transformer oils for the power sector, liquid paraffins for the pharmaceutical industry, cable splice filling and flooding compounds for the telecom industry, petroleum sulphonates, calcium/barium sulphonates for the additive industry and a host of other petroleum speciality products. All the products of the company are utilised in core industries and have been developed by its own R and D centre, which received recognition from the Department of Science and Technology way back in 1976. In line with its policy of continuous innovation, the company is now diversifying into the allied field of automotive and industrial lubricants and is also doubling the capacity of its existing product range by setting up a new unit at its existing site (on the Thane-Belapur road in Maharashtra). The unit, which is expected to cost around Rs 28.3 crore, will have an installed capacity of 15,000 kl of lubricating oils, 14,000 kl of transformer oils, 7,000 kl of liquid paraffins (white oils) and 1,500 mt of petroleum sulphonates per annum. The company has entered into a technical collaboration agreement with Idemitsu International (Asia) Pte, which is an affiliate of Japan's largest independent oil company, namely, Idemitsu Kosan Co, under which the collaborator will provide the technical know-how for the manufacture and marketing of the entire range of lubricants and also train the marketing and technical staff of SC. Further, the company will be using the Idemitsu trade mark in India and its lubricants will be launched under the brand name 'Apolloil' and 'Daphne' in October this year. Commercial production of transformer oils, lubricating oil and white oil is expected to commence shortly. To part finance its project and to finance the setting up of marketing and distribution infrastructure for its lubricants the company is entering the capital market with a public issue of 22,62,100 equity shares of Rs 10 each at a premium of Rs 100 per share. The issue, which will open for subscription on August 9, will be lead managed by Kotak Mahindra Finance.

NK Industries

A government recognised trading house and India's largest exporter of various grades of castor oil to developed countries, NK Industries enjoys a 25 per cent market share in the country's castor oil exports and its forex earnings for 1993-94 stood at Rs 66 crore as against Rs 33 crore in the previous year. The company now plans to enhance its installed capacity for expelling from 60,000 mtpa to 1,20,000 mtpa and that for refining from 45,000 mtpa to 90,000 mtpa. Further, it also plans to install a 75,000 mtpa solvent extraction plant, a 7,500 mtpa hydrogenated castor oil plant and a 7,500 mtpa 12-hydroxy stearic acid plant. The company also plans to modernise its refining process in order to improve productivity by using the latest technology in detoxification and castor derivatives for the first time in the country. The project, which is being undertaken at an outlay of Rs 20 crore, is being set up at Kadi in the Mehsana district of Gujarat and will be eligible for backward area benefits in addition to enjoying easy access to castor seeds and being in proximity to the port of Kandla. The company has already received firm orders from Nidera Handelscompangnie b v of Rotterdam, Nl and Braswey SA of Brazil for about 70 per cent of its production. The company is also entering the global market for agriculture commodities by setting up a trading branch at London, UK, for which it has received RBI approval. While the expeller section has already been commissioned, the refinery section is expected to be commissioned in September and the solvent extraction plant is to be commissioned in February/March 1995. Production of castor derivatives is to commence in December this year. To part finance its project and also to meet working capital needs the company is entering the capital market with a public issue of 15,00,000 equity shares of Rs 10 each which will be offered at a premium of Rs 30 per share. The issue, which will open for subscription on August 8 and will be lead managed by Bank of Baroda and Mehta Integrated Finance, will bring down the promoters' (and associates') stake in the total paid-up equity of the company to 75 per cent.

Man Aluminium

The flagship company of the Mansukhani group, Man Aluminium, is engaged in the manufacture of aluminium extruded sections (AES) which are mainly used in building construction, furniture, automobile bodies and irrigation. The project was set up in 1989 at a total cost of Rs 5.5 crore and has an installed capacity of 4,000 mtpa. A leading exporter of AES in the country, Man Aluminium now proposes to diversify by setting up a project for the manufacture of API standard submerged arc welded (SAW) pipes up to 12m length, 0.4m to 1.5m in diameter with wall thickness from 6mm to 25mm, in financial and technical collaboration with CHR Haeusler AG of Switzerland. The project is being set up in the Dhar district of Madhya Pradesh at a total cost of Rs 44 crore and is expected to commence commercial production by July 1995. To part finance the project the company is entering the capital market with a public issue of 55,95,000 equity shares of Rs 10 each which will be offered at a premium of Rs 5 per share. The issue will open for subscription on August 9 and will be lead managed by IDBI and Indus Financial Services.

Saurashtra Paper

Saurashtra Paper and Board Mills (SPBM), a member of the Saurashtra group which has four decades of experience in the paper and packaging industry, is entering the capital market, with a public issue of equity shares of Rs 10 each which will be offered at a premium of Rs 25 per share. The company presently manufactures cultural papers such as writing and printing papers in addition to industrial papers (kraft papers) at its two plants in Navagam and Shapar. The former has an installed capacity of 4,800 mtpa to manufacture kraft paper while the latter has an installed capacity of 12,000 mtpa and 7,500 mtpa to manufacture deluxe grade kraft paper and writing-printing paper, respectively. The company now proposes to raise the capacity of the Navagam plant to 6,000 mtpa and that of the Shapar plant to 15,000 mtpa of deluxe grade kraft paper and 9,375 mtpa of writing-printing paper. The issue aggregating Rs 5 crore is to part finance this Rs 7.1 crore expansion programme and will open for public subscription on August 3.

Wim Plast

Wim Plast, which has been jointly promoted by the Cello group and M G Shah group, is setting up a project for the manufacture of high fashion injection moulded plastic furniture like chairs, tables, etc. The project will have an installed capacity of 7,34,400 pcs per annum (2,020 tpa) and is estimated to cost Rs 10.9 crore. The company's products will be marketed under the 'Cello' brand and in addition to being cost-effective compared to conventional products made out of wood, steel and other materials, will also have the latest and contemporary European designs and other distinctive features such as vivid colour combinations, maximum comfort and light weight. The project is expected to commence commercial production by October and is to be part financed through a public issue of equity shares aggregating Rs 1.3 crore which will open for public subscription on August 2.

The annual rate of inflation remains above the 10 per cent mark, but more disturbingly, the rise in prices of food items, both primary and manufactured, has been significantly higher in the past 12 months than in the corresponding previous period. Reflecting this, the rise in the cost of living indexes for both industrial and agricultural workers has been far sharper over the last 12 months. The composition of exports and imports in 1993-94 by commodity groups shows a notable rise in the share of capital goods in total imports, which has to be seen in the context of the decline in the domestic production of capital goods for the second year in succession in 1993-94.

GSL (INDIA)

Modernisation and Expansion

GSL (INDIA) (formerly Gujarat Spinners), a joint venture between Sudershan Silk Mills and GSTC and one of the leading manufacturers of speciality blended yarn, improved its performance significantly in 1992-93. The company's net sale rose by 40.6 per cent over the previous year while operating profit increased by 75 per cent. The company claims that the rise in production and sale has been due to its aggressive marketing, shopfloor management, cost controls and product-mix changes. The labour rationalisation carried out during the year led to a 20.3 per cent fall in total remuneration to employees. With the completion of the company's moderni-sation-cum-expansion programme during the year, production of yarns during the year was higher at 4,771 mt as compared to 4,183 mt and exports saw a more than 100 per cent rise over the previous year to Rs 3.1 crore. Though interest and depreciation charges rose significantly over the previous year, net profit rose by 380 per cent and the dividend rate was raised to 20 per cent on the enhanced capital. The company's focus on quality can be seen in the fact that it won two awards during the year, namely, the European Market Research Centre award at Brussels in recognition of its export performance in the European market and the Rashtriya Udyog award given by the All India Forum of Economic Development for maintaining high standards of productivity. Further, it also won the Unity award for creating public awareness on unity in the wake of the Ayodhya riots.

To part finance its modernisation-cum-expansion programme, which was implemented at a total cost of Rs 13.3 crore, the company entered the capital market in 1992-93 with a rights issue of equity shares aggregating Rs 1.6 crore in the ratio of two equity shares for every five shares held, leading to a [illegible] in the company's equity capital to Rs 5.1 crore. The programme which envisaged increasing the company's spindlage from 23,856 spindles to 30,016 spindles was successfully completed and autoconers and two-for-one twister machines have been installed to manufacture uniform knotless and fancy yarn. The company now has plans to carry out a diversification programme for generation and distribution of power and it also plans to invest in the shares of GSL Products. For the purpose it plans to increase its authorised equity capital from the present Rs 7 crore to Rs 10 crore.

Meanwhile, for the first six months of 1993-94 the company earned a net profit of Rs 2.2 crore which is 28 per cent higher than the net profit earned for the entire year in 1992-93 and sale was also higher at Rs 31 crore. Encouraged by its performance the company undertook to increase its capacity to 40,000 spindles by March 1994 and further to 50,000 spindles in December 1995 at a total cost of Rs 27 crore.

LML

Towards a Turnaround

The Kanpur-based, Singhania group company, LML, which has a technical-cum-financial agreement with the Italian two-wheeler giant, Piaggio, managed to increase its net sales in 1992-93 by 85.6 per cent (on an annualised basis) over the previous year. Further, as against a net loss of Rs 34.8 crore in the previous year, the company's loss was only Rs 6.1 crore in 1992-93, showing signs of a turnaround. The company attributes its performance to the measures initiated by it such as rationalisation, improved product quality and performance as also the thrust given to marketing. Production was higher at 1,21,722 scooters as against 1,10,646 scooters in the previous year and sale was higher at 1,24,159 scooters as against 1,10,797 sold in the previous year. The company has also succeeded in reducing the import content of its product from 29.4 per cent to 17.7 per cent. Further, the contribution per vehicle improved significantly mainly due to the overwhelming success of the new model 'Select' which was introduced during the year. The new model, which is easily the most expensive scooter in the market, accounted for 55 per cent of its turnover and is already the most sought-after scooter in the market according to the company. Further, operating profit more than quadrupled over the previous 18-month period.

Meanwhile the friction between the Singhanias and Piaggio has reportedly been sorted out and a new arrangement worked out under which management control of all the Indian operations of LML will rest with the former who will also have a 25.5 per cent stake in the company's equity capital. LML will also manufacture and export its scooters to Piaggio, which in turn will market them in Europe.

For the year 1993-94 the company has managed a turnover of Rs 126 crore and a net profit of Rs 7.6 crore. Further, it increased its market share from 8 per cent in 1991-92 to 18 per cent. The company now plans to undertake an expansion programme to increase its capacity from 15,000 vehicles to 25,000 vehicles per month at a total cost of Rs 60 crore. It also plans to introduce a new series of two-wheelers with improved technology and design features conforming to international standards. The company plans to position itself as a manufacturer of premium products with a presence in all the segments of the two-wheeler market.

POLAR INDUSTRIES

Diversification Programme

The flagship company of the Rs 120 crore Polar group, Polar Industries has five divisions, namely, a portable fans division, a ceiling fans division, a press and lamination division, a pump division and a motor division. The company manufactures well known brands of ceiling fans and table fans. In 1992-93 the company saw a fall in net sales (on an annualised basis) and profits. During the period the company manufactured 4,62,473 (5,90,326) fans, 75,493 (53,343) pumps, 14,278 (5,305) electric motors and 1,012 mt (1,440 mt) of electric stampings of various types. The production facilities at the pump division at Noida, which were destroyed by fire during the year, were completely re-erected and the company has received the insurance claim in full.

During the year the company set up a new motor division at Faridabad to cater to the cooler fan industry and it now plans to manufacture washing machine motors, general purpose motors and other specialised motors at this division. With the increase in activity at the motor division, the pressing division is also expected to utilise its capacity to a fuller extent. The company now has plans to install a high speed press for manufacturing electrical stamping. With the company commencing export of new models and capturing the export market in European countries like Germany, France, Switzerland, etc, its export earnings more than doubled in 1992-93. The company also planned to enter the capital market with a rights-cum-public issue to finance its various backward integration projects as also to meet its long-term and working capital requirements.

With the merger of Polar Electrotech with the company, economies of scale are expected to accrue and with the heightened emphasis on rural electrification by the government, the company's directors envisage improved performance in the future. The company has planned a major expansion programme at an outlay of Rs 30 crore which envisages strengthening its other related activities such as the manufacture of monoblock pumps, electrical stampings (a vital component of a motor) and fractional horse power motors (FHP motors) which are used in white goods such as air-conditioners, washing machines,

* 15 months

** 18 months

audio/video equipment and the like. It plans to derive about half of its turnover from divisions other than fans in the next three years. For the purpose the company is scouting for a technological tie-up to produce hi-tech 'jet pumps'. It also plans to increase the capacity of the electrical stamping division from the present 180 tpa to 400 tpa which will be a kind of backward integration for the company as it will utilise up to 60 per cent of its capacity for its own consumption.

Anil Agarwal, chairman, expects the company to save up to Rs 1.8 crore per annum from the manufacture of stampings (increased capacity) which will go as a straight support to its bottomline. Meanwhile the company has finalised a deal with Amcol for setting up a joint venture for manufacturing electric fixtures at a total cost of over Rs 10 crore with both companies having an equal stake in the venture. Amcol has reportedly chosen India as its base in order to take advantage of the low labour cost. A joint venture for manufacturing fans in China is also planned with Amcol.

For the six months ended December 1993 the company earned a net profit of Rs 1.3 crore on a net sale of Rs 21.1 crore.

RASOI

Raw Material Shortage

Rasoi, which is engaged in the manufacture of vanaspati, refined oil, acid oil and oxygen gas, saw a 5 per cent fall in net sales in 1992-93. Vanaspati, which is the main product of the company, constitutes only 15 per cent of total edible oils and is the only cooking medium which is subjected to heavy taxation and excise duty by the state and central governments when even high priced refined oils are exempt. Though the excise duty on vanaspati was reduced from Rs 1,900 per mt to Rs 1,500 per mt in the 1993 Finance Bill, refined oils which compete with vanaspati are still cheaper. The industry as a whole already suffers from low capacity utilisation following the discontinuance of allocation of imported oils and the banning of use of expeller mustard oil in the manufacture of vanaspati further aggravated the problem of raw material shortage during the year under review. Further, with the newly set up vanaspati units enjoying sales tax exemption/deferment benefits as per the respective state governments' rules, the old units are outpriced, mainly so in the northern part of the country leading to the company's decision to suspend operations at Haryana Vanaspati and General Mills.

With the adverse situation prevailing in the industry the company saw a fall in both production and sale realisation. Production of vanaspati fell from 17,134 mt last year to 16,817 mt in 1992-93 while that of tin containers and oxygen gas fell from 5 lakh and 29,773 cubic metres to 4.6 lakh and 10,392 cubic metres, respectively. Though sale of vanaspati increased from 16,891 mt to 17,265 mt, sale realisation fell from Rs 62.9 crore to Rs 59.3 crore. Sale of acid oil and oxygen gas fell from 2,216 mt and 29,825 cubic metres to 1,810 mt and 10,340 cubic metres, respectively. The company's operating profit fell by 38.5 per cent and even the fall in interest charges, depreciation charges and tax provision could not arrest the 20.5 per cent fall in net profit.

For the year 1993-94, as per its unaudited results, the company managed to show a rise in net profit (Rs 80 lakh) despite a fall in its net sales to Rs 59.8 crore.

SHRENUJ

Growing Demand

The third largest company in the diamond business in the country, Shrenuj and Co which exports up to 98 per cent of its net sales, is next only to Suraj Diamonds and Classic Diamonds. The company is engaged in the business of cutting, polishing and processing rough diamonds at its three sites at Rajkot, Navsari and SEEPZ, Bombay (a 100 per cent EOU). A pioneer of the laser cutting technology in the country, the company has improved its performance in 1992-93 by notching a 33.3 per cent rise in net sales and a 30 per cent rise in operating profit. Though interest charges rose by 44.4 per cent, a fall in depreciation charges and tax provision led to a 33.7 per cent rise in net profit. The company saw a 36.6 per cent rise in exports during the year. Though there was a shift in demand towards low value diamonds in the global market, which is under recessionary conditions, the company managed to improve sales by changing its product mix. During the year the company produced 67,939 carats of cut and polished diamonds as against 54,994 carats produced in the previous year. The 100 per cent export-oriented jewellery manufacturing unit at SEEPZ was commissioned in January 1993. Sales of cut and polished diamonds were also higher at 71,569 carats (worth Rs 61.6 crore) as against 52,886 carats (worth Rs 46.4 crore) in the previous year.

With the company's rights issue (which comprised 28,00,000 equity shares of Rs 10 each offered at a premium of Rs 25 per share) in November 1992 to part finance its 100 per cent EOU, its equity capital has risen from Rs 5.6 crore to Rs 8.2 crore. Encouraged by its performance in 1992-93 the company maintained the dividend rate at 30 per cent on the enhanced capital.

With the demand in US and Europe improving steadily, the company's net sales for the first six months of 1993-94 have risen to Rs 45.3 crore and net profit to Rs 3.6 crore as against a net sale of Rs 32.3 crore and net profit of Rs 3.3 crore in the corresponding period last year.

MAXWELL APPAREL

Targets Exceeded

The flagship company of the VIP group, Maxwell Apparel Industries achieved sales of Rs 82.5 crore and a net profit of Rs 4.1 crore in 1993-94, representing an increase of 30 per cent and 46 per cent respectively over the previous year. The company's performance has exceeded its projections at the time of its public issue and, further, it has declared a 1:1 bonus. Its new process house near Bombay, which is now fully operational, will cater not only to internal needs but also undertake job orders from other companies while the yarn spinning mill which is being implemented in Tamil Nadu is expected to commence commercial production by January 1995. The company plans to achieve international quality standards through backward integration by setting up its own fabric processing plant and cotton spinning mill with an initial capacity of 20,000 spindles

GNFC

New Ventures

Gujarat Narmada Valley Fertilizers Company (GNFC) is implementing an acetic acid project for which the basic engineering work has been completed. The detailed engineering of all equipment and instruments has also been completed and civil works at site are progressing in full swing and mechanical erection will commence shortly. Meanwhile in order to take advantage of the new government policy and the existing market environment in the country following liberalisation the company has converted its project into a domestic tariff area (DTA) unit resulting in an increase of Rs 21.7 crore in the total cost of the project to Rs 222.3 crore. The increase in cost is to be financed through internal accruals and through the retained over-subscription part of its non-convertible debenture issue. The company is also implementing TDI and aniline projects which are being implemented by a joint venture company (christened Narmada Chematur Petrochemicals) between GNFC and Chematur Engineering AB of Sweden. The first phase of the project consisting of nitrobenzene and aniline plants together with the common off-site facilities is expected to go into production by October 1994. The company also planned to launch a US $ 115 million in July.

A 'Language' Problem

GPD

The issue raised by Taslima Nasreen's* Lajja *is, in the last analysis, one of language and not theology. People for whom modernity is essentially a west-of-Khyber phenomenon will find it difficult to understand this.

LET us put the matter straight. We have not read Rushdie's *Satanic Verses*. Nor have we read Taslima Nasreen's *Lajja*. But then this piece is not about the books themselves anyway. It is possible that *Lajja* is a second-rate book, as a leading Indo-Anglian writer of India has pointed out. *Satanic Verses* has been taken a little more seriously. The book has been attacked on the ground that it is blasphemous of Islam. The argument against Rushdie's book seems to be mainly theological. The case with Nasreen's novel seems to be different. A number of critics and writers have made bold to say that it is a second-rate work in the first place. The thought crossed our mind whether the fact that Nasreen's work is in Bengali and has been published in Bangladesh has been responsible for this difference. Rushdie's book was written in English and published in Britain and as such might have got an advantage which Nasreen's work was unlikely to get. As if this disadvantage were not enough, people connected with the BJP and the Sangh parivar who are normally fairly ill-informed about literature and the arts decided to celebrate her book. The 'lajja' (honour) of the book could not have been more damaged.

You might think that we are making too much of this 'language' problem. But Indian society, especially its elite, has the most callous attitude to Indian languages (except of course English and Hindi). There was a big seminar in Lonavala (at one time a beautiful hill-station midway between Bombay and Pune) recently. We understand that a film-maker there said that he was proud of the fact that he did not know any Marathi in spite of the fact that he lived in Bombay. He makes films in Hindi, so presumably the status of Hindi as a civilised language is acceptable to him. Why he does not make his films in English would have been one good question to ask. Yet another sociologist went on to argue that with authors like Amitav Ghosh and Upamanyu Chatterjee (we hope we have spelt the names correctly) writing in English and writing so well, there was virtually no need to read 'Bengalee' writing. We could get the flavour of Bengal without reading Bengalee literature. We were not invited to that seminar. So these views are given here the way they were summarised for us by somebody who was there. One can ignore the sociologist inasmuch as all modern sociology in India is in English and, as such, if somebody like that thought that Indian languages were redundant it made sense. But the film-maker who does employ a native language in his films was arguing that 'regionalism' was no longer valid. He should be making his films in Esperanto or, next best, in the English of the one, universal land unpolluted by regionalism.

It would seem that this colonised mind-set is partly responsible for the violent reaction to Nasreen's (possibly second-rate) Bengali novel which attempts to look at the plight of a minority family in Bangladesh. Those who think (and there are many) that Indo-Anglian literature is good enough to understand the world of the natives would not understand the impact that a book in the vernacular seems to make. *Lajja* thus is not only taken to be blasphemous but also as a 'native' intrusion into the glory of religious excellence on the one hand and the excellence of English on the other. There is a linguistic aspect to the quarrel over the *Lajja*.

In the case of *Satanic Verses* the colonial mind-set acted in one way—how can you say this or that about Islam in English was the question then. In the case of *Lajja* the colonial mind-set operates in a different way—how can you say these things in the language of the natives? In both cases, the argument is taken to be proven. With Rushdie the case is internationalised. With Nasreen it remains more localised. *Satanic Verses* was banned because it was published in England, the land of the international. *Lajja* was not banned because a book in a native language is presumably not harmful. It has now been translated into more than one native language which does not matter to our languageless elite of film-makers and sociologists. The problem is one of language and not a theological issue in the last analysis. We are waiting to acquire the translation of *Lajja* in our language so that we would know what 'blasphemy' reads like in a native language.

Precisely because it is a linguistic (and only remotely a theological) question, *Lajja* has raised a storm much larger than what Rushdie's book could ever do. Rushdie came under attack. In the case of Taslima, the educated people of Bangladesh are divided. Had she been writing in English or any such 'international' (and presumably therefore civilised) language, it would not have led to the genuine rift among the Bangladeshi Muslim intellectuals. The Sangh parivar's favourite argument has always been that there is no 'modern' element among the Muslims. The mobilisation on the Shah Bano case proved them wrong. So has the stout defence of Nasreen by a section of Bangladeshi Muslims.

Modernity is a universal phenomenon. But it achieves its universality paradoxically through its regionalism. The universality is possible only because there is still regionality. Those who have no use for the dialectics of regionalism and universalism cannot see the mobilising quality of the native languages. This is the reason also why Rajab Ali of Mymensingh (father of Taslima Nasreen) and his family have been threatened and they have bravely stood up to the challenge so far. Of course anything could happen tomorrow. But a 'Bengalee' book (let me repeat, possibly a second-rate one) has created a storm which is going to change quite a few things. Maybe, even a setback would follow. But the 'regional' character of Bengal would have proved itself. A section of Bangladeshi Muslims have made all those who still use native languages (apart from Hindi, that is) proud of their enterprise. Because it is in those languages that the arguments in favour of a position or against become meaningful. In that sense the genuineness of the fundamentalist opposition cannot be doubted. Its wisdom can be. It would be foolhardy to say how the battle over Taslima's novel would end. But that it has been joined is beyond doubt. People for whom modernity is essentially a west-of-Khyber phenomenon would find it difficult to understand this or, even if they understood it, they would probably find it irrelevant and meaningless and return to their favourite Indo-Anglian writers. In the meanwhile, the natives would go on threatening and killing each other—and writing in the native languages.

Auctioning of Rupee Funds

New Issues in Indo-Russian Economic Relations

R G Gidadhubli

Two proposals mooted by the Russian government during the Indian prime minister's recent visit to Russia—auctioning of rupee funds representing debt repayment to Russia and investment of these funds in equity capital in India—raise new issues in Indo-Russian economic relations which need to be carefully considered by the Indian government.

THE visit of prime minister Narasimha Rao to Moscow from June 29 to July 2, during which a joint declaration was made and nine agreements were signed covering political, defence, economic, scientific-technical and cultural fields, assumed great significance in forging close Indo-Russian relations in the years to come. In the economic field efforts are to be made in the next two-three months to translate the agreements into concrete measures. When implemented, a new chapter will be opened in economic ties between India and Russia. Two proposals that mark this new development are: (a) auctioning of the rupee funds in Moscow; and (b) investment of the rupee funds in equity capital in India.

The genesis of this new development is that from 1993 Russia has been receiving rupee funds to the tune of Rs 3,000 crore per year as part of debt repayment to Russia. Thus over the next 12 years, a sum of Rs 36,000 crore will be made available by India. An agreement had been reached during Boris Yeltsin's visit to India in January 1993 that these funds were to be used by Russia for the purchase of goods from India. But during the last over one year Russia has not been able to utilise much of these funds and hence the rupee funds have been getting accumulated. So Russia has now proposed modifications in the mode and purpose of the use of funds. An effort is made here to analyse these proposals in view of their implications for India in the years to come. It is also worthwhile to consider possible measures to safeguard India's interests.

It appears that the Russian government was considering tthe auction of 'clearing rupees' (the term used for rupee funds in Moscow) over the last several months which would serve not only as an incentive for availing of accumulating rupee funds but also for boosting sagging Indo-Russian trade. Moreover, it could also be a source of earning dollars for the Russian exchequer. What lent credence to this concept was that some foreign firms operating in Moscow apparently offered US $ 2 for Rs 100 to buy up crores of clearing rupees from the Russian government after Yeltsin's visit to India last year. But the deals did not materialise probably because there was pressure on the Russian government from the newly-emerging groups of private trading houses and even the state trading organisations dealing with foreign trade who feared loss of the opportunity to use these rupee funds.

There is an added dimension to the rupee auctioning. As reported by Vladimir Radyuhin (*The Hindu*, June 29) the proposal to auction clearing rupees in Russia was reported to have been made by the Russian finance ministry. That this proposal did not originate from the ministry of foreign trade (MFT) was significant. The MFT had actually prepared a list of commodities worth Rs 1,900 crore to be purchased from India against debt repayment before the proposal of rupee auction was made by the finance ministry. Further, according to the Russian deputy prime minister Yuri Yarov, several Russian government agencies were putting up claims for the clearing rupees which again suggests that there was no lack of demand for Indian goods to be bought with the clearing rupees. What was really lacking was a proper mechanism by which the clearing rupees could be utilised.

Be that as it may, the need for rupee auction was justified by the Russian side on the eve of the visit of the Indian prime minister. Elaborating the Russian government's position on this issue, it has been observed that notwithstanding the inter-governmental exchange of letters of January 28, 1993 on the use of the rupee funds, several factors had hampered the utilisation of the funds for importing goods and services from India. They stem from the transitional character of the Russian economy in which the market mechanism for international valuation of the Russian currency is far from perfect. Hence, as an experiment, allocation of a portion of the rupee funds to Russian importers through the Moscow central stock exchange had been under consideration. It is further contended that this would also enhance the receipts to the Russian exchanger and also enable establishment of a real market rate of exchange for centralised imports against the rupee funds.

Two possibilities can be visualised in rupee auctions by Russia:

Possibility I: It has been suggested that rupees may be auctioned at 20 per cent discount in Moscow to earn more dollars (*Indian Express*, July 7). Instead of Rs 31 for one dollar which is the prevailing exchange rate, the Russian government will be able to auction rupees at about Rs 25-26, which means getting $ 400 mn and not $ 330 mn by auctioning an estimated Rs 1,000 crore in 1994, a net additional earning of $ 70 mn.

Possibility II: As per another report, clearing rupees are to be auctioned at 80 per cent of the rupee-rouble cross rate through the US dollar (*The Hindu*, June 29). The prevailing dollar rate is US $ 1 = Rb 2000 = Rs 31. This means cross rate for Re 1 = 65 roubles and 80 per cent of this means Re 1 = 52 roubles. Thus if about Rs 1,000 crore (about one-third of the Rs 3,000 crore which India is required to pay annually) are auctioned in one go, the Russian bidders will be required to pay only Rb 520,000 mn instead of Rb 650,000 mn. For Russian importing agencies this will be an incentive to import from India and this will make Indian goods cheap and competitive in the Russian market.

While a clear picture will emerge in due course as and when auctions actually take place, the rupee auctions have several implications and raise many issues:

(1) A major possible implication is that the rupee auctions will encourage 'switch trade' by the agencies and organisations who have access to rupee funds. They may use these funds to divert goods imported from India to earn hard currencies. This is particularly likely in the case of many traditional agricultural items of export such as tea, coffee, tobacco, oil cake and so on. Apart from possibly affecting Indian exports to other markets, this will deprive Indian exporters of the opportunity to cultivate the Russian market. Another result may be unstable or even declining demand for Indian goods exported to Russia and other CIS countries thus affecting the Indian economy.

(2) Rupee auction may not help India's export of engineering goods and hi-tech items if no guidelines or conditions are stipulated by the Russian government on the use of the auctioned funds. Russian agencies and enterprises may prefer to import these goods from the west, although in the past huge investment was made and capacities were created in India to produce many goods to cater to the former Soviet market. So far as

other manufactured goods such as textiles, garments, etc, are concerned, in principle the rupee auctions may make Indian goods relatively cheap and hence competitive as compared to those from China and South Korea. But if the latter countries resort to dumping, then this advantage may be lost.
(3) A Russian commentator has said that the rupee auctions will be confined to Russian buyers and will carry a stipulation that the rupees can be used only for importing goods from India. Re-export to third countries will also be prohibited. It is doubtful that such commitments can be expected to be made, much less enforced. Once the rupees are auctioned, the Russian government may not be able to exercise much control over their use. This is the case with several decrees or laws in Russia which are there on paper but are hardly implemented. If it is seen as a lucrative proposition, then Russian agencies could be used as a cover by foreign firms for participating in the auctions. Alternatively, they may buy up the rupee funds from the Russian agencies who procure them at a discount from the Russian government. Hence the rupee auctions may not help genuine Russian trading agencies and may be exploited by speculators and mafia groups.
(4) Rupee auctioning goes against the basic objectives of rupee trade between India and the former Soviet Union as promoted for the last about four decades. First and foremost, rupee accounting was intended to avoid and bypass hard currency transactions and intervention. India was to repay in terms of goods whatever credits the former Soviet Union offered for the development of India's basic industries such as steel, power, mining, etc. There was bilateral balancing of trade so that neither country was required to make any monetary payment.
(5) The rupee auction has in a sense been forced on India by the Russian government. The contention that it is an internal matter of Russia as to how to use the rupee funds is not entirely tenable since the move does go against the spirit of Indo-Soviet economic ties, the legacy of which Russia has inherited. The rupee auction proposal underscores the fact that India has been making concessions to Russia once again after consenting to a very favourable rupee-rouble exchange rate during Yeltsin's visit to New Delhi in January 1993. It is to be examined whether the proposed defence deals and joint venture schemes will adequately compensate India for these concessions.
(6) On the eve of the summit meeting in Moscow the Russian government decided to grant Russian importers of Indian goods a 180 days' deferred payment facility which amounts to six months' interest-free credit to the importers. Moreover, goods imported against debt repayments have been exempted from the value added tax of 20 per cent and the special tax of 3 per cent. These two concessions will help increase imports from India. As an additional measure to use the rupee funds, the Russian government has organised contract tenders for importing specific commodities from India, enabling Russian trading agencies to import a wide range of consumer goods such as toothpaste, shoe uppers, medicines, detergents, cosmetics, spices, bed linen and so on (*The Hindu*, July 15).

INVESTMENT IN INDIAN EQUITY

Another important issue relates to the utilisation of the rupee funds for investment. Both India and Russia have agreed on this issue in principle so that a portion of India's debt repayment can be utilised to finance construction and modernisation of industrial and other projects in Russia and in India (*The Times of India*, July 9). Thus the Russian contribution to the equity of Indo-Russian joint ventures to be set up in India could be financed out of the rupee funds. In other words, the Russian government will be converting the past (Soviet) rouble credits to India into equity shares in Indian companies. While the details are being worked out, the implications of the move deserve careful consideration.

The Russian government seems to have invested about Rs 1,000 crore in Indian securities in 1993-94 out of the rupee funds at its command. That the Russian government would have done this with the consent of the Indian government is to be taken for granted. The present proposal for equity investment seems to be a shrewd logical next step on the part of Russia which was mooted by the Russian prime minister, Viktor Chernomyrdin, at his meeting with Narasimha Rao in Moscow.

From Russia's point of view, investment in Indian equity capital will partly take care of the accumulated rupee credits. At a time when Russia needs huge investments at home for transforming its own economy, the decision to invest in equity capital in India seems to be motivated by expectation of high and secure returns on the investment. Moreover, the relative worth of Rs 1,000 crore in stocks in India will be higher and hence preferable to the equivalent of $ 300 mn in stocks in Russia where inflation is high, the economy is in disarray and there is high risk on investment. It is possible that the Russian government will use its leverage to secure participation in joint venture enterprises in India, besides employment of Russian consultants, technical advisers, etc, in India.

So far as India is concerned, there will be no immediate capital outflow following investment of the rupee funds in Indian equity. The funds are to be utilised for the setting up of new enterprises and modernisation of existing units and for infrastructure development. Russian investment may be particularly welcome in power projects which have been held up or delayed for want of funds. Russia also proposes to utilise part of the funds for reconstructing the Novorossisk port and related communication facilities.

Russian investment of rupee funds in equity capital in India raises several issues:

—Had Russia imported goods from India fully utilising the debt repayment amount of Rs 3,000 crore per year, the question of Russian investment would not have arisen at all. That would have been more beneficial for India by way of creating job opportunities, expanding the manufacturing sector, increasing the demand for agriculture-based goods and so on. Non-utilisation of repayment funds by Russia for import of goods might have forced India to agree to this arrangement. It will be highly speculative to presume that this could be part of Russia's new policy objectives.

—Investment of rupee funds by Russia is qualitatively different from foreign investment in terms of hard currency in the Indian economy and the net benefit may not be significant.

—Russian investment of rupee funds goes against the basic principle of linking aid and trade underlying Soviet-Indian economic co-operation for four decades. The former Soviet government had claimed that its socialist foreign economic policy of linking aid and trade differed from and was superior to the capitalist approach. The Soviet Union was also against export of capital, against investment abroad in the private sector and above all against repatriation of profit. The Soviet Union encouraged imports from aid-receiving countries, including India. These principles had been transformed into policies and protocols between India and the Soviet Union. Russia should now abide by the previous commitments to India instead of converting past Soviet socialist economic assistance into Russian capitalist investment.

—The value of Russian investment for modernising the Indian industrial sector is open to question. Russia's ability to modernise hi-tech Indian industries, such as electronics, is limited considering Russia's own technological lag in these sectors. Even for the fuel and energy sectors, Russia has been approaching Germany, US, etc, for advanced and eco-friendly technologies. Russian investment is likely to be beneficial to India for modernising only a few defence-oriented industries.

In these circumstances the question is how India should safeguard its interests. The Indo-Russian joint commission will meet in September. Before the meeting, negotiations are to take place in the next two-three months.

Indian policy-makers and India's trading community should urge upon the Russian authorities the following:

(a) There should be a limit fixed by Russia with the knowledge of the Indian government on the amount of rupee funds to be auctioned in Russia.

(b) The Indian government should categorically oppose any experiment by Russia to auction rupee funds for dollars as this will amount to devaluing the rupee and will also lead to switch trade deals on a large scale affecting India's interests.

(c) The Russian government should specify and notify items which will be allowed to be imported from India with the auctioned rupees. This will help Indian exporting firms to meet Russian requirements. There should be supervision over the adherence of the Russian and Indian governments to this condition.

(d) Clearing rupees auctioned by Russia should also be utilised by Russian trading firms for import of manufactured goods, particularly engineering and electronic items and machinery and equipment, which used to be imported on a large scale from India before the Soviet disintegration and for which necessary capacities were specially created in India.

(e) Indo-Russian joint trading ventures and Indian export agencies with a well-established track record of trading with the former Soviet Union and later Russia should be allowed to participate in the rupee auctions in Moscow. They should be treated on par with Russian agencies since rupee trade is involved. If this is not done then speculators in Russia and India may band together to exploit the situation to the detriment of the interests of both countries.

(f) Russian investment in equity capital in India should be the last priority for utilising the rupee funds. If such investment is inevitable, then it should be distributed between joint ventures in India and in Russia.

World Cup USA: A Different Perspective

Dipankar Sinha

While the world debates the art of Latin American football and the power play of their European counterparts the fact that the World Cup USA was also a 'game' of the New World Order played according to the rules of globalisation cannot be ignored.

WITH the end of the 'greatest show on earth', the US-hosted World Cup football tournament, incorrigible sceptics, some of whom still survive the onslaught of the totalising 'New World Order' further marginalise themselves. Obsessed with exploration of hidden dimensions and the dimensions that are often overlooked, the sceptics do not even spare the World Cup USA. While the rest of the world continues to debate on issues concerning the 'art' of the Latin American football and the power play of their European counterparts, standards of referees, rise and fall of megastars and the worth of the champions, the sceptics 'break up' the tournament differently to come to the conclusion that it was also a 'game' of the 'New World Order' played according to the rules of globalisation.

If we conceptualise globalisation as a set of universal processes which, by multiplicity of explicit and implicit interactions, interconnections and interdependence, seeks to develop what Roland Robertson calls the "concrete structuration of the world as a whole", it might help to realise how the sceptics argue that the 'greatest show on earth became a 'great show of globalisation'

One of the prime features of globalisation in the 'New World Order' is elimination of culture-specificity. The process of elimination entails steamrolling the claims of a specific culture by the so-called global culture. By itself the process is inherently political because the publicists of 'global' culture in aggressive display of power seek to promote it unilaterally. In the World Cup 1994 the game of football was promoted to make it a part of 'global' culture. The very selection of the site of the tournament might have been, as is argued generally, a result of the financial might of the US Soccer Federation and the influence it has over FIFA, but it can also be viewed from a broader perspective. That the bonanza had to be offered in a country where the overwhelming majority of citizens are not even aware that soccer could be so popular as to have worldwide competition, made it clear that a 'football culture' based on popular awareness and attachment was not considered an essential criterion by the promoters of 'global' culture. Then again, the imposition of 'global' culture does not require an enlightened public.

The sponsors of globalisation in the 'New World Order' always insist on a global show. Even a case of estrangement and tragedy like the Gulf War had to be a global show because the 'sponsors' wanted it that way. Because of the grandeur of its show the Gulf War till today holds the distinction of being the only war in the history of mankind to have provided a 'visual treat' of death and destruction by its global live telecast to the people at the dining table. To refer back to the World Cup USA, the opening ceremony held at Soldier Field was a part of the effort to "make the game more spectator friendly", to quote Jim Paglia, the president of Entertainment Destination Enterprises, USA, in a nation where spectators refuse to become 'soccer friendly'. That America has set its eyes on football was globally witnessed through live telecast of the show which had among others, the US president delivering a dull speech, Diana Ross dancing and crooning, and Oprah Winfrey, 'the talk show lady', wandering aimlessly most of the time. In a vulgar and absurd show of the so-called composite nature of the 'global' culture which was threatened by the Yankee show, highly un-artistic movements, called by the name folk dance, were shown by 24 human peacocks, representing the 'culture' of the contending states. The giant sized replica of the World Cup placed at the site of the opening ceremony seemed to have symbolised the award of the 'champion-state' of the 'New World Order', in display for the rest of the world to see and admire.

It is an open secret that the processes of globalisation in the 'New World Order' are tied to various short- and long-term commercial propositions. The World Cup USA was no exception to the rule. It is widely believed that FIFA's 'blue-eyed boy' in the US, the chairman and chief executive officer of the tournament, was 'elected' as the president of the US Soccer Federation when he agreed to pay a greater percentage of Federation's marketing rights to FIFA than what his chief contender, Werner Fricker, could offer. Also, the FIFA-directed change in the long-established rules of the game was motivated by what Joseph Blatter, the FIFA secretary-general, described as "the desire to provide more entertainment to the crowd". However, it goes without saying that more entertainment to more spectators means more money from advertisements. In the tournament the playing arenas were literally engulfed by banners of some of most powerful companies having global operations. The list runs like this: Coca Cola, Chevrolet, JVC, Canon, Fujifilm, Gillette, Philips, Opel, Snickers, MacDonald, and the company paying for telecast, MasterCard. With a record number of people in hundreds of countries watching the live telecast, the tournament provided these 'giants' with the opportunity to exploit the world's most popular game for what in advertising parlance is known as 'global mileage'. The point is not that

advertisement revenues are unimportant but allowance to advertisers needs to be kept within a reasonable limit so that interventions by the merchandising world do not reduce the game to a mere consumerist affair.

Even the 'Maradona episode' in the World Cup USA is interpreted in some quarters as a 'product' of a not-so-fair-gameplan of a well known German sportsgoods company which also acts as sponsors to both FIFA and the German world cup squad. The argument put forth was simple: that the company had exerted its influence on FIFA to 'destroy' Maradona and his team so that the German team could win the World Cup and serve the commercial interests of the company. While there is little evidence to suggest that such a 'request' was ever made, or that the FIFA officials are gullible enough to accede to such a request if it was ever made, the logic based on the 'hand of the multinationals' encourages the sceptics for a different reason altogether. The nature of allegation, akin to that made against some well known cosmetics- and garments-manufacturing companies during the Miss Universe Beauty Pageant '94 for their lobbying activities, proves that there are some who have at least spared a moment to think of the possibility of intricate and hidden linkages and oversighted trade practices of the multinationals in the global supermarket.

International media has a vital role to play in the globalisation game. In fact, it can be said that nothing in the 'New World Order' happens without the media being involved in some way or other. Recent history shows that in most cases the media-hyped 'drama' has a great contribution to media's globalisation role. It needed the 'drama' of the fall of the Berlin wall for international media to announce the globalisation of neo-liberalism; the 'drama' of famine was needed to let the world know about Ethiopia, and the 'drama' of death and destruction to globalise concerns about relief in Bosnia. In the somewhat lacklustre World Cup USA, Maradona, arguably the greatest footballer ever, provided the international media with much-needed 'inputs' to globalise the 'drama' with so much vigour that even the extermination of Andres Escobar, the ill-fated Colombian world cupper, was relegated to the background. After all, Escobar lacked fame/notoreity to have aroused interest at the global level. Not being able to capitalise on the rise of a megastar, with Roberto Baggio, the Italian super-hero and the media-tipped successor to Maradona, failing to live up to expectations in the first round of the tournament, the media in desperation chose the fallen megastar—christening him Diego the Disgraced or Dirty Diego. In an uninspiring case of a decongestant relieving, if not Maradona's flu but the man himself and his team from the tournament, the western media as well as their third world counterpart found all the ingredients of a 'drama'.

The moot point for the sceptics is not that Maradona was victimised for having found an idol in Fidel Castro, the 'commie' president of Cuba. In the 'New World Order' the political supremacy of the US logically demands that the American policy-makers will be too busy to bother about a footballer's personal choice, even if the footballer happens to be Maradona. Nor are the sceptics obsessed with arguments about whether Maradona had taken the five banned substances deliberately or whether Brazil or Italy had a hand in ejecting the football genius and his team from the competition. What is worth being analysed is the way the media injected a moral and ethical dimension to the 'drama' by raising the bogey of justice and fairness for all. That FIFA also endorsed this line of thinking was proved by Alan Rothenberg's stance that "reasons do not matter because it is all a fairness issue", and Step Blatter, the FIFA secretary, describing it as a "human, moral issue". Even if one accepts that Maradona had made a blunder in not only causing dishonour to himself but also to his country and millions of fans around the world, one cannot ignore that fact that in simultaneously criminalising Maradona, the individual and moralising Maradona, the issue the media only followed yet another condition of the globalising embrace of the 'New World Order': overplay moral issues to construct and disseminate a monolithic story making everyone else inaudible. Here again the Gulf War *story* might serve as a good example.

The World Cup USA was also utilised by the media for global dissemination of 'coloured' images of the world. While Colombia was depicted as violence-ridden, criminal-infested, chaotic jungle of druglords, Argentina was projected, especially through the 'Maradona episode' as a nation of hero-worshipping paranoids. While Brazil received the 'distinction' of being a nation of football-maniacs or soccer-lunatics, Romania, being personified in Gheorghe Hagi, and Bulgaria, with Hristo Stoichkov, the 'reincarnated Christ', as nations inspired by 'liberation' from the communist bondage. Nigeria, Cameroon and Morocco, especially the first two, were described as states which averted a war because football 'brought them closer'. We learn more: that the Germans are most disciplined and powerful, even if somewhat mechanistic; that the Scandinavians exude confidence in spite of low key-appearance; that the Italians have religious tolerance in accepting Baggio, the Buddhist as their idol; that if the Americans do not excel in something it is because they do not want to.

While it might seem paradoxical that such images of 'fragments' are being disseminated at a time when the vigorous promotion of 'global' culture is evident more than ever before, it is not hard to explore the rationale of such practice. As is evident from the instances, we have black/dark regions comprising the 'third world' where evil 'guys', paranoids, lunatics and war-mongers roam. We also have the bright and shining white realm marked by the rule of the disciplined, civilised, progressive, powerful and liberated members of humanity. Then there are the grey areas which are in a state of transition after shaking off socialism. The hidden politics of 'global' culture which has an essentially westcentric base, demand that such categorisations be made. Epistemologically, globalisation rests on a systematic interaction with 'others', knowledge of the 'other'; an assessment based on acquired knowledge thus becomes essential. However, it is also an interesting feature of globalisation that the knowledge acquired for the purpose of assessment need not be accurate or complete. Inaccurate or incomplete knowledge of 'others' is regarded as accurate or complete as long as it proclaims the superiority of the sponsors of globalisation in the 'New World Order'.

The 'New World Order' is based on an extremely complex trajectory of global consolidation. Globalisation necessarily involves such consolidatory moves which manifest themselves in different modes and in different spheres to present an image of the world as a single system with its centre in the west. As part of systematic macro-construction of the contemporary world order, the processes of globalisation in the 'New World Order' have to take a more complex form than the microlevel globalisation based on empire-building in the imperialist era. The levels and layers of penetration of globalisation have a bewildering variety because its centrality calls for 'proper ordering' of standards of behaviour, orientations, belief-systems, norms, identities and life-styles for development of a collective social understanding at a global scale.

In their effort to understand this process the sceptics devise a special 'route'. First, because they are not ready to treat everything at the programmatic level and in terms of action-orientation the sceptics look for methodological, rather, epistemological roots. Second, unlike the mainstream academics the sceptics do not use the principle of exclusion in the name of academic respectability to exclude 'trivial' events from the purview of their search for vital clues. Thus, the surviving sceptics of the 'New World Order' could avoid 'deconstructing' the World Cup USA only at their peril.

Human Rights and Dawoodi Bohras

Asghar Ali Engineer

There is large-scale infringement of civil liberties and human rights of the Bohra community at the hands of its priestly class. Although two human rights commissions have urged the government to intervene in the secular affairs of the community on behalf of ordinary Bohras, nothing has been done so far.

I

THE Dawoodi Bohras and their priesthood have been in the news for close to two decades now. Today the Bohras are a highly oppressed and exploited community at the hands of their own priesthood. Few communities are so harshly oppressed and exploited as the Bohra community. The Bohras are a Shi'a Ismaili sub-sect of Islam. The Muslims, as is well known, were divided into two major sects—Sunnis and Shi'as after the death of the prophet. These two major sects were subdivided into number of sub-sects over a period of time. The Shi'as believe in the institution of imamat as the Sunnis believe in that of khilafat.

According to the Shi'a belief, the holy prophet had appointed 'Ali, his son-in-law, as his political as well as spiritual successor. The institution of imamat continued in his progeny of which imam Ja'afar al-Sadiq was the fifth (and according to the Isna Ashari Shias, the sixth) imam. After his death the Shi'a Muslims split into Ishna Ashari and Isma'ili Shi'as. The Bohras are a branch of Isma'ili Shi'as. According to the Isma'ilis, the chain of imamat continued in the progeny of Isma'il. However, after the 18th imam al-Mustansir, the Isma'ilis were divided on the question of succession into Nizaris (followers of the present day Aga Khan) and Must'alians (earlier, Qaramitas and Duruzes had already split from the Isma'ilis, forming new sects of which Qaramita are extinct but the Duruze Muslims live in the hills of Lebanon).

On the side of Must'alian branch, the 21st imam Tyeb had to go into seclusion on account of political conditions, and he died in seclusion. However, the Bohras believe that the institution of imamat continues in his progeny in seclusion but in the absence of imam da'is (literally, summoners to the faith), they began to deputise imam and carry out religious functions on his behalf. The first da'i was appointed in Yemen and was known as Syedna Zoeb bin Musa. However, unlike the office of imam, the office of da'i was not hereditary and any competent alim (scholar) could be appointed to the august office by his predecessor. Also, imam is supposed to be infallible but a da'i is not. A da'i is liable to commit error. However, later on a new dogma was evolved that though da'i is not infallible ('m'asum'), he is like infallible ('kal-m'asum'). However, the reformist Bohras challenge this as it is not born out by the authenticated books of the sect. There are grave implications indeed, if this claim of the da'i being kal m'asum is accepted. Today, the reformists in the community are fighting against reeking corruption in the system headed by the da'i who is 52nd in the line of the da'is. However, the head priest refuses to accept that the system headed by him is facing rampant corruption.

The Dawoodi Bohras, most of whom were converted from Hinduism (from various castes ranging from brahmans to vaisyas and shatriyas) in the 12th and 13th centuries, are today about 12 million throughout the world. Of them, around a million live in India principally in four states, i e, Maharashtra, Gujarat, Rajasthan and Madhya Pradesh. They are also found in big trading centres like Calcutta, Madras, Hyderabad, Cochin, Calicut, etc. Bohras are mainly a business community and hence tend to be peace loving. They are comparatively economically better off than other Muslims but have their own quota of poverty. In cities like Bombay some Bohras live in extreme poverty in various slums like Golibar, Jogeshwari, Dharavi, etc. Bohras are somewhat more literate than other Muslims though higher education is not very widespread. They generally opt for functional literacy useful for trading rather than higher education.

The Bohras have been historically a well-knit and cohesive community. As it faced persecution from the Sunni rulers in India, it became extremely centripetal, generally avoiding inner dissensions. However, it did face splits, both major as well as minor, from time to time, especially on the question of succession to the office of da'i. Even then it can be termed to have been a fairly obedient community until the advent of the British rule in India when it was relieved of external pressures. It was after the consolidation of the British rule that inner dissensions began to surface within the community.

When the Bohras went for modern education they began to distinguish between the religious and the secular, and to feel that the Syedna should not exercise control over the secular aspects of life. It must be mentioned here that the earlier da'is were quite benevolent towards the community and lived simple and exemplary life. They generally did not extort money from the community and whatever voluntary contributions were made, were generally spent on various welfare measures. However, after the consolidation of the British rule when the Bohras began to prosper in western region of India, the high priests began to exercise greater and greater control over the community so that they could also get more share in the wealth. This tendency became quite acute particularly during the time of the 51st da'i, Syedna Ther Saifuddin. As he became more repressive and greedy for money, a challenge emerged to his authority from within the community.

However, the community faced rift in Udaipur towards the end of 19th century on the question of managing the affairs of local jamaat. The da'i at the time asked the members of the local jamaat to hand over the keys of the jamaat khana to the amil (head priest's representative) but they refused. They maintained that the da'i could not interfere in secular affairs of the community. The matter went to the court of the Rana of Mewar who gave his verdict in favour of the Udaipur jamaat. Similarly, the sons of Adamji Pirbhai, a wealthy and influential businessman of Bombay, challenged the authority of the 51st da'i in the Bombay High Court in early 20th century for misusing the funds from the cash box kept at the mausoleum of Chandabhai Seth in Bombay for buying private properties.

The Bohra high priest made fantastic claims in the Bombay High Court. He claimed that he was the real owner of the properties as well as souls and bodies of the Bohras. They were mere slaves. That he was a god on earth and could change provisions of the Islamic shari'ah. Of course these claims were dismissed by the then Justice Martin who heard the case. The high priest then began to use the weapon of 'salam bandh' (i e, ex-communication) against the dissidents. The 51st da'i began a repressive era which continues in our times. It is an unending tale of woes. The da'i took ruthless measures to consolidate his authority and his prime concern was no more to offer religious guidance in a spirit of humility but to establish his full control over the minds and souls of the community. And what his successor Syedna Muhammad Burhanuddin did was even worse.

Through various means, fair and foul, both these da'is have been engaged in amassing wealth and living in style. The 51st da'i began to describe himself as 'Sultan-ul-Bawahir', i e, the king of the Bohras. These were no mere empty words. The Syedna tried to live like sultan. He called his dwelling place a palace, Saifee Mahal. Like the Mughal kings, he demanded of his followers that they not only bow before him but also perform 'sajda' (prostration). Needless to say, these are all un-Islamic acts, the prophet of Islam led a simple life, even went hungry for days to live within frugal means. He had strictly forbidden everyone to bow before him. Sajda was meant only for Allah. But, in the care of

the Syedna's herald announces his coming and all are required to stand with folded hands, with their heads bowed.

For all this a lot of money was needed. The 'royal family' devised ingenious ways to amass wealth. The Bohras were required to pay to the high priest seven taxes—zakat, khums, sila, fitra, sabil, haqqun nafs and nazar muqam. A network of amils was required to collect the taxes regularly and exercise coercive measures against the defaulters. The high priest was not satisfied even with this. In order to extort more money, he began distributing honorific titles NKD (Al-Nashito fi Khidmatid Dawat) and MKD (al-Mu'in fi Khidmatid Dawat). He also gave the title of 'sheikh' now to rich businessmen, a title earlier meant only for distinguished ulama and learned theologians. In return for these titles, he charged great deal of money. Also, he demanded huge amounts by way of salaam (personal offerings). The salaam amount may run into lakhs of rupees. One who refused to give would be humiliated and insulted. It is also true that the neo-rich vied with each other for offering him huge amounts generally earned legitimately or illegimately during the first world war.

Since the 51st da'i gave up the simplicity of earlier da'is, many problems began for the community. The emphasis shifted from religiosity to worldly glamour. More and more emphasis began to be laid on the glory of the da'i and his role in 'dawat'. His entire family began to be glorified. Also, the members of the da'is family began to distance themselves from the ordinary members of the community. They treated these 'ordinary members' with disdain. The Islamic concept of equality of all human beings was relegated to the background. The da'i began to emerge as not only the central figure but also the most important one in the whole system. The imam in seclusion was now mentioned only in passing. The birthday of the da'i began to be celebrated with much greater fan-fare than that of Imam al-Zaman (i e, Imam of the time in seclusion).

Many felt disturbed at these developments but could not speak out for fear of ex-communication. Even many amils disliked all this but felt helpless as their livelihood depended on the establishment of the da'i. Strict censor rules were enforced and the amils were required to submit the material of their sermons (va'az) to the da'i for his approval. These amils were also instructed to devote most of their time to glorifying the da'i. Those amils who complied were richly rewarded by posting them to high income-generating cities, and those who did not, were punished either by being suspended or posted in less income-generating towns.

The glorification of the da'i was further intensified during the 52nd da'i's regime. It went so far as to relegate even the prophet of Islam to (believe it or not) an inferior position. In a calendar published a few years ago, da'i's picture was inserted after Allah, and only then the name of the holy prophet was mentioned. The Muslim ulama and leaders who were sent copies of the calendar did not mutter a word against it nor did the Urdu newspapers write anything against it. Most of the ulama and editors of Urdu papers as well as Muslim leaders are beholden to the Syedna in one way or the other. And, therefore, they never protest even if the Syedna is guilty of most blatant anti-Islamic acts. Many of these leaders and ulama are lavishly treated by the Bohra high priest in his palace.

II

As pointed out above, the period of the 52nd da'i proved to be much more repressive than that of his predecessor. It was, therefore, natural that deep discontent developed within the community. A revolt broke out in Udaipur in 1972 when the da'i's establishment tried to compel the Bohras of Udaipur to dissolve their legitimately formed Bohra Youth Association as well as a co-operative bank set up by them on the grounds that these organisations were formed without the 'raza' (permission) of the high priest. The high priest's establishment was now seeking to impose strictest possible control over the institutions of the community. No institution could be set up without permission of the high priest. Even the local priest could not give permission. He has to seek permission from the Syedna before giving his approval.

When the Bohras of Udaipur maintained that it was their constitutional right to establish any such institutions, they were severely punished. The high priest declared social boycott against them and their womenfolk were molested in Galiakot dargah where they had gone to visit the mausoleum on the death anniversary of the saint. Moreover, in order to make the 'punishment' exemplary, the Bohras of Udaipur belonging to the youth group, as they came to be identified now, were debarred from entering any mosque or mausoleum throughout India. Also, anyone who maintained any contact with them was also similarly punished. Most of the families in Udaipur were divided between pro- and anti-Syedna, i e, 'shababis' and 'youthis' as they were known.

The Syedna's establishment created a reign of terror in the entire community. Any paper which supported the reformist cause was also punished. *Bombay Samachar*, a Gujarati paper which consistently supported the reformist cause and is widely read among the Bohras was specially denounced and any Bohra reading it was severely punished. Urdu *Blitz*, another paper which supported the reform movement, was also proscribed, though very few Bohras read it. The repressive measures went to such an extent that if a husband or a wife supported the reform movement, their marriage was forcibly dissolved. Many families were thus disrupted. In few cases, even children born of these marital bonds had already entered into wedlock. When the reformists complained to the government of serious violations of their fundamental and constitutional rights, it took no notice of these grievances. If feared loss of Bohra votes, though the fear was hardly justified. The reformists were really exasperated.

After the emergency they approached Jay Prakash Narayan, who was also the president of Citizens for Democracy (CFD) which had courageously fought against emergency. Jay Prakash not only patiently heard the reformists but also wrote a letter to the Syedna urging upon him to see that the dispute within the community was amicably resolved. However, the Syedna's establishment chose to remain silent. The reformists then requested Jay Prakash to institute an enquiry into their grievances on behalf of the CFD, which he agreed to. An inquiry commission was constituted headed by justice N P Nathwani—a retired judge of the Bombay High Court. Other members of the commission comprised two eminent academicians, Alam Khundmiri and Moin Shakir, a legal luminary and human rights activist justice V M Tarkunde, and C T Daru and Alu Dastur, a noted Gandhian who later resigned as she was inducted into the Public Service Commission by the Janata government.

The commission examined several witnesses and documentary evidence submitted by many aggrieved Bohras and prepared its report which was published in 1979. The commission observed in its report: "Our enquiry has shown that there is large-scale infringement of civil liberties and human rights of reformist Bohras at the hands of the priestly class and that those who fail to obey the orders of the Syedna and his amils, even in purely secular matters, are subjected to 'baraat' resulting in complete social boycott, mental torture and frequent physical assaults. The 'misaq' (the oath of unquestioning obedience to the head priest) which every Bohra is required to give before he or she attains the age of majority, is used as the main instrument for keeping the entire community under the subjugation of the Syedna and his nominees. On the threat of baraat and the resulting grave disabilities, Bohras are prevented from reading periodicals which are censored by the Syedna (such as the *Bombay Samachar*, the *Blitz* and the *Bohra Bulletin*); from establishing charitable institutions like orphanages, dispensaries, libraries, etc, without the prior permission of the Syedna except by submitting to such conditions as he may impose; from contesting elections to municipal and legislative bodies without securing beforehand the blessings of the Syedna; and above all, from having any social contact with a person subjected to baraat, even if the person is one's husband, wife, mother, sister, father or son. The weapon of baraat has been used to compel a husband to divorce his wife, a son to disown his father, a mother to refuse to see her son, and a brother or sister to desist from attending the marriage of his or her sister or brother. An excommunicated member becomes virtually

an untouchable in the community, and besides being isolated from his friends and nearest relatives, is unable to attend and offer prayers at the Bohra mosque. Even death does not release him from the taboo, for his dead body is not allowed to be buried at the community's common burial ground."

We have given this long quotation from the findings of the Nathwani commission report to show the extent of repression which the Bohra priesthood is imposing on the community. The publication of the report brought to the public notice the serious problem in the Bohra community and the gravity of the struggle being waged by the reformist Bohras demanding democratic changes in the functioning of jamaats and their secular affairs. However, as expected, the government took no notice of the recommendations of the Nathwani report. However, it did help the reformists by creating public awareness.

III

The Nathwani commission carried out investigations of various complaints up to 1979 when the report was published. However, the Bohra priesthood continued to oppress and exploit the Bohras even after the report was published. It took, as if, no notice of the report. In many ways, the repressive measures increased on its part. Thus many things happened during early 80s. A drive was launched to compel the Bohras to close their accounts in the Mercantile Co-operative Bank on the pretext that giving and taking interest was prohibited in Islam. The real motive was to destroy the Mercantile Co-operative Bank, because if interest was prohibited, it was prohibited for all the banks, not only for one particular bank. They sought to destroy the bank because they could not bring it under their control. It has been the Bohra high priest's practice that either they established their total control over an institution or they destroy it.

The Bohra priesthood also launched a drive for compulsory wearing of 'rida' (veil) for women and growing of beard and wearing of cap for men. Those who did not comply were put under social boycott ruining their social and family life. Also, women without rida and men without cap and beard were not permitted to join marriage, funeral or any other social functions. Hundreds of persons were insulted, humiliated and driven out of such functions. A strong wave of resentment spread through the community but no one could show courage to resist. Most of the Bohras preferred to submit meekly. There were only few cases of protest.

There were also many cases of physical assaults on the reformists and their supporters. This writer was also assaulted twice in early 80s, once in Hyderabad and again in Cairo (Egypt). Similarly, many others were also assaulted. In sheer desperation the priesthood, in order to improve its sagging

image, planted a bomb outside the mausoleum of the 51st da'i. The bomb exploded damaging two vehicles and injuring one person. The priesthood cried wolf and tried to implicate the reformists. But no one was convinced and accusing fingers were pointed towards priesthood itself. However, the priestly establishment organised processions in many towns and cities to celebrate the fact that the Syedna escaped unhurt in the bomb explosion incident.

Throughout the 80s the priesthood continued to let loose a reign of repression on the Bohras. The reformists, therefore, once again approached CFD and Indian People's Human Rights Organisation to appoint a commission to investigate into the cases of harassment and persecution of the Bohras at the hands of their priesthood. The president and secretary general of both the organisations, respectively, agreed to conduct an inquiry. An announcement to this effect was made in the 8th All World Dawoodi Bohra Conference held in Bombay in February 1991.

Justice D S Tevatia, the retired chief justice of Calcutta High Court and Kudip Nayar, a noted journalist and an ex-high commissioner of India to UK agreed to be on the commission of inquiry. The commission framed a questionnaire and sent it to a number of Bohras. It received response from more than 1,500 persons. They gave details of their grievances, many of them attaching documentary evidence too. The commission held two sittings, one in Udaipur and another in Bombay. In Udaipur deponents came from various places in Rajasthan and also from Neemuch in MP. In Bombay, on the other hand, deponents came from various places like Aurangabad, Hyderabad, Calcutta, Mandsaur, Indore, Bhopal, Ahmedabad, Lathi, Godhra, Ujjain and several others. However, for lack of time the commission could examine only 55 deponents in Udaipur and about 125 deponents in Bombay during its sittings.

The commission also received a trunk full of documents from various complainants. It had to examine all these documents to prepare its report. About the control of the high priest over the community, the report observes: "Virtually all vital social and secular actions of the members of the community were controlled by the high priest through the instrumentality of raza (permission). No member of the community could marry without prior permission, no member of the community could construct a house without permission, no member of the community could start an organisation or a business without prior permission, no member of the community could bury his relative's dead body without prior permission, no member could open an orphanage, open school, create a trust, stand for any election, vote for any candidate without prior consent of the head priest, conveyed directly or through his local amil...Any member of the community who does so without prior permission is made subject to baraat total social boycott by the members of the Bohra community."

This clearly shows the extent of the control exercised by the priesthood over the community. There is undoubtedly total regimentation. The social network of the community is such that there is no escape from this regimentation for an ordinary Bohra. He is so completely dependent on this network that his/her existence outside it cannot be imagined, let alone attempted. The high priest exploits this fact to the hilt. It would thus be no exaggeration to say that a Bohra is literally not free even to breathe. His entire life is under tight control of the priesthood.

Thus the Tevatia commission report says, "The use of misaq, raza and baraat is intended to effectively and absolutely enslave the members of the Bohra community to the head priest so that the head priest has a free hand to do what he likes and financially exploit the community to the extent he likes and interfere in their social and secular affairs to the extent he likes and virtually reduce them to the position of pawns and puppets in his hands and thus with impunity violate their human rights and self dignity and in turn enjoy unquestioned and undiluted authority over everything connected with Dawoodi Bohra community and make such use of them as he likes for his own or his family's political and financial advancement and interest."

The commission has also given details of the taxes levied by the high priest and estimated his income to around Rs 20 crore per annum. All this money remains totally unaccounted for and is spent mostly on personal comforts and luxury. The whole family consisting nearly of 200 members lives off this income. They have found out ingenious ways to avoid even taxation on this huge income every year. On collection of taxes the commission observes: "The efficiency with which the aforesaid taxes and levies are collected by Syedna saheb is all too evident from the form at Annexure D earlier referred to. The taxation department of the government of India may learn a lesson or two from his efficiency. A reference to the abovesaid taxes would show that a Dawoodi Bohra has to pay to the high priest even before he is born and continues to pay until after he is dead. Thus tax is levied on foetus as well as on dead ancestors. Taxes on foetus is a novel idea which perhaps no government in the world had ever tried. The levy on foetus is called 'hamal' (literally meaning pregnancy). A separate column is provided for it in the printed taxation forms provided to the collectors."

Thus it will be seen that taxation and its collection by the priesthood is so efficient that it could be envy of any government, particularly in India. However, this efficiency is the result not of efficiency of the tax collecting machinery but its coerciveness. The threat of social boycott makes people pay up. Sometimes arbitrary levies are imposed. The Bohras have no option but to pay. In addition to these taxes, the Bohras are also made to pay donations on one pretext or the other.

About coercion and persecutory measures resorted to by the priesthood, the commission says, "Every Bohra who answered the questionnaire has his own story to tell, of physical assault, of social persecution, of agony and mental torture, of attack on his property, of ruination of his business due to the fear of baraat and social boycott, of deprivation of company and starvation of affection of one's spouse, children, parents, close relations and friends, of subjection to ban on entering into mosque, jamaatkhana, community guest houses, one's own burial as also of his relations in the community graveyard, denial of permission for marriage of one's children by the high priest. However, out of large number of instances we propose to relate by way of illustration only a few instances of social boycott and the resultant mental agony, and torture."

Thus one can imagine the kind of harassment and persecution a Bohra faces if he dares to challenge the priesthood. No wonder then that most of them choose to submit, quite meekly at that. In conclusion the commission says, "Ours is second commission after a lapse of 14 years. It is painful to find that Syedna has not learnt anything from the criticism that the Nathwani commission, the first one, made about his working. In fact he has become worse now, not even bothered about what others say, much less the Dawoodi Bohra community which he heads. No community among the Muslims has suffered so much and for so long as the Dawoodi Bohras have done at the hands of a leader, who continues to be dictatorial, ruthless and unmindful of cruelties he perpetrates."

The commission further observes: "His mode of working is to strike terror in the minds of his followers. They dare not question Syedna. Even the highly placed among them obey him and his petty subordinates blindly. Any tax imposed or money demanded is paid obediently, although most members of the community are aware of the luxuries in which he and his family wallow."

This and much more has been said by the commission. No doubt this report will tell the painful story of the sufferings of the reformists among the Dawoodi Bohras. But the powers that be would not be moved. The government bothers more about the votes than the sufferings of the people. The Tevatia commission has recommended two bills to be enacted: one against social boycott and another one to control Syedna's finances. The draft for the first bill was given by the Nathwani commission also. But the present commission has given a comprehensive draft for the second bill too. Both the bills need to be urgently enacted to contain coercion as well as corruption of the Bohra high priest.

Will the government of India do something?

INTERNATIONAL BUSINESS

- Construction Group's overseas turnover touched Rs.87 crores and orders valued at Rs.261 crores were booked.

Major overseas orders

- Construction of a township of 600 housing units at Zernograd, Russia, valued at Rs.163 crores.
- Water treatment plant for Central Water Authority in Mauritius, valued at Rs.6 crores.
- 33/11 kV substations at Ras Al Khaimah, UAE, valued at Rs.26 crores.
- Export order under execution from Born Heaters Limited, UK, for supply of fired heaters for a refinery in Singapore.
- Switchgear business booked in Thailand.
- L&T's ACBs introduced in Australia.
- Breakthrough orders from new customers in USA for fully-machined and semi-machined cast and forged components.

Impressed by L&T's Eutectic Business in India, Eutectic+Castolin has entrusted to L&T, as market associate, the marketing of its products in South East Asia.

Software exports continued to grow. A satellite communication link between L&T's IBM ES 9000 mainframe at Powai and IMS-Frankfurt, Germany, was established for the execution of an offshore development project.

RESEARCH & DEVELOPMENT

- L&T developed an indigenous, cost-effective hydrostatic version of a compactor.
- Loader-backhoe, model 580, incorporating improved power transmission systems, introduced.
- Prototype hydraulic transmission drive developed for replacing the mechanical transmission system of shunting locomotives.
- New designs of fuse-switch units and upgraded version of ACBs introduced.

International Quality

Several ISO 9000 certificates were received by the L&T Group of Companies for:

- Industrial valves
- Pressure vessels, heat exchangers, reactors and structural fabrication
- Project management of chemical plants & systems
- Switchgear, switchboards and petroleum dispensing units
- Software services
- Electronics
- Earthmoving equipment.

L&T has been ranked first in terms of high quality of services/products and second in corporate leadership among Indian companies by Asia's leading economic journal, the Hong Kong-based Far Eastern Economic Review in its annual survey of Asian corporate leadership.

EMPLOYEE RELATIONS

A four-year settlement, covering all Bombay-based unionised employees, was signed in December 1993. Industrial relations in all establishments and worksites were by and large cordial. The active cooperation of employees is an important factor in the Company's growth and success.

Railway bridge at Haladi – one of ten bridges, eight tunnels and six viaducts being built by L&T's Construction Group for the Konkan railway project

Looking Back in Wonder

In Search of Our Ecological Roots

Rahul

The burgeoning struggles around natural resources have generated a groundswell of debate in political and academic circles which has established the validity of social science research from an ecological angle. The need today is to evolve a framework and eventually establish the guiding principles of an ecological historiography and praxis.

Oh, our mothers all have their price and our sons throw themselves away
For the crew of the sinking ship will be glad to reach any old rock
And all the dying man wants of this world is to fight that he
May know dawn once again and again the third crow of the cock.

—Bertolt Brecht.

CONFLICTS over natural resource use have sharpened over the past two decades or so in India and have found expression in the form of organised mass movements. The distinguishing feature of these movements is their concern primarily with the human deprivation caused by industrial development through displacement and environmental degradation than with just its environmental impact *per se*. This burgeoning struggle has also provided inspiration for considerable investigative journalism as the issues raised by these movements have caught the imagination of a constituency not directly affected by the deleterious effects of development but who are nevertheless worried by the long-term consequences. This groundswell of interest and the debate generated in political and academic circles has established the validity of social science research from an ecological angle.

Consequently there has been a trend among historians to research instances of similar protest in the past. This has come as a reaction to mainstream history writing which has tended to ignore the struggle for existence of the poor and the downtrodden, the subalterns. A considerable amount of theoretical and factual material regarding the activities of the subalterns during the British rule has been generated by the subaltern school of historians. Similarly there has been an increase in anthropological and natural scientific enquiry into the lives of communities living in close proximity to nature and their habitats. The pressing need today is for a framework that can provide a systematic basis for further enquiries. Such a framework will also help in the formulation of a strategy for future struggles.

This Fissured Land authored by Madhav Gadgil and Ramchandra Guha (Oxford University Press, New Delhi, 1992) is a pioneering effort in the direction of providing such a framework and as such deserves to be commended. However, by trying to take in the broad sweep of Indian history from the ancient times to the present without a sufficient grounding in hard facts their effort has turned out to be more conjecture than history. Moreover, the framework they have adopted as the basis for historical enquiry is itself flawed and has resulted in their reaching some dubious and dangerous conclusions. A detailed critique is here attempted with the aim of starting a debate, that, it is hoped, will eventually establish the guiding principles of an ecological historiography and praxis.

The book has been written in three parts. The first part constitutes an attempt by the authors to build a systematic framework for the study of ecological history. The second part is a recapitulation of ancient and medieval Indian history interpreted from an ecological standpoint. The third part recounts in detail the encounter between the British imperialists and the Indians and the effect British colonial rule had on the forests of India. It also examines the forest policies of the government of India after independence up to the present times. The critique will follow the same sequence for convenience.

A Theory of Ecological History

The authors state in the prologue that they have attempted to study the conditions under which humans are prudent or profligate in their use of natural resources, the various technologies and belief systems that have influenced this resource use and the conflicts arising out of competing claims of different groups of people on these resources. To do this a new concept 'mode of resource use' has been advanced to supplement the Marxist concept of 'mode of resource use, however, is as problematical as the concept of mode of production' as a means of identifying distinct historical epochs. This they have done to remove the lacuna of neglect of the interaction between humans and their ecological base that they have perceived in the study of history so far. The concept of mode of resource use, however, is as problematical as the concept of mode of production which it seeks to replace. Both modes of production and modes of resource use are not independent and absolute variables but very much determined by and in turn determining other variables such as the distribution of political and economic power and belief systems in society. The different modes have always overlapped and apart from the modern industrial era and the early hunter gatherer era it is very difficult to specify precisely a particular era as being dominated by a particular mode. The material base, the belief systems and social relations have all influenced each other to a greater or lesser degree in the development of mankind.

The introduction of the problematic concept of the mode of resource use creates some serious problems for the understanding of history. Even though the whole of the period from the end of the Mauryan era up to the advent of the British can be said to have been dominated by the peasant mode of production there were massive changes in social organisation and economic activities over this whole period which profoundly influenced modes of resource use. This has been totally ignored by the authors in their treatment of this period as will be discussed later. The authors go on to say that they have played down the difference between the capitalist and socialist systems in modern times because from the point of view of ecological impact and technologies of resource use thay have more or less been similar. This is an extremely ahistorical way of looking at events because it overlooks the fact that the industrial revolution and capitalism were brought on by the commercial revolution attendant on the huge surpluses pouring into Europe as a consequence of colonial brigandage. The fact that the socialist economies postdate capitalism and have been far less extractive and exploitative on a local and global scale than the capitalist economies being driven as they were by an egalitarian ethic and not by the profit motive is also ignored. The two world wars fought because of the rapacious rivalries of the capitalist states and the subsequent militarisation of the whole world is not thought to be of any consequence. The multinational corporations, the World Bank, the IMF and now the Multilateral Trade Organisation which are all responsible in large measure for the environmental and human devastation of the third world and the pirating of its environmental resources have it seems all gained legitimacy with the collapse of the socialist challenge against the deleterious effects of capitalism. Just because the orthodox Marxist analysis does not take account of the ecological effects of industrial development does not mean that it has become totally irrelevant and that it cannot be modified. Thus by rejecting Marxist analysis and introducing their own half-baked

concepts the authors are not only guilty of throwing the baby out with the bathwater but also of replacing it with some more bathwater.

The changes in technologies of resource use have taken place from the desire in humans to improve their living conditions which is a basic characteristic that differentiates them from other animals. Whereas some humans have subsisted for millennia at the primary hunter gatherer level others have progressed to the peasant or industrial levels. This difference has been triggered by scarcities in the resource base caused initially by natural factors and later by humans. Thus there seems to be some justification for studying the conditions and technology influencing the prudence or profligacy of resource use. The need to conserve resource bases and social structures with a given level of technology has given rise to belief systems and rules and regulations tinged with religion to give them authority [Childe 1942]. Invariably both resource bases and belief systems evolved to conserve them come under attack simultaneously. At such times the fight is primarily over these resource bases which are vital to a community's existence and only appear to be directed by belief systems. That these belief systems are only contingent and not absolute is evident from the fact that under the pressure of having to eke out a subsistence existence in a dominant industrial mode tribals all over the country are further degrading instead of conserving their immediate environment once it has been devastated by industrial development [Agrawal et al 1985]. In the second part the authors erroneously strive to string together the belief systems of a few tribes and castes into an ideology of resource conservation. The conflicts whether intermodal or intramodal are over maintaining the sources of livelihood and not for conserving the environment for the sake of the environment. To impute higher motives is to err in the direction of idealisation in a manner similar to the way orthodox Marxists have done with respect to the working class. Today when post-modernist thinking and recent history have successfully debunked both the epistemological and practical validity of sectarian ideologies as tools of understanding and action the authors' preoccupation with creating yet another such ideology is perplexing to say the least and downright diabolical to be quite severe.

When there is so much overlap between social structures, belief systems, technologies of resource use and ecological impacts over different periods of history an ideal classification according to modes of resource use can be of little practical use. The figures and tables of the classification thus made by the authors, even though they look impressive, add little to our understanding of history as they are nothing more than elements of an innovative collation of material already available to us from previous research. There is instead the danger of such a dubious classification blinkering our view of history. Indeed the authors themselves have become confused trying to draw conclusions from this framework as is evident from their preposterous assertion that intramodal conflict is necessary for the stable functioning of a mode of production. They say that in the industrial-capitalist mode the state controls the forests to safeguard the stability of the industrial mode. They have themselves described in detail how both the colonial and independent states in India have devastated the forests in the interests of capitalism in the third part of the book. The capitalist state whether in the developed countries or in India takes strong conservationist action only when forced to do so by popular protest by groups who are either materially or ideologically opposed to the dominant mode of resource use. Increase in population and increasingly voracious resource use to satisfy the rampant consumerism and militarism of late capitalism has resulted in conflicts intensifying to the point where the continuation of human civilisation itself is in jeopardy. Under the circumstances the authors' failure to put conflict in a proper perspective and to indict capitalism further reduces the utility of their faulty theory.

Dubious Twist to Old Debate

The study of ancient Indian history is very problematical because of the paucity of reliable sources. There are the archaeological remains of the Indus valley civilisations, the Vedic and epic literature and edicts, coins and seals. Thus the history that has been pieced together so far has involved a lot of unreliable guesswork and some painstaking textual, linguistic and material analysis [Kosambi 1956]. Society was in an incredible state of flux what with climatic changes, influx of new people across the Hindu Kush and new technologies being imported into the subcontinent. Settled cultivation finally came to dominate during the reign of the Guptas in the 4th century AD. The intervening years saw a tremendous development in trade as a consequence of the development of trade routes following on Greek expansionism and the Mauryan consolidation. To ascertain the ecological causes and effects of these developments it is necessary to make a thorough investigation of the scanty sources available. The authors indulge in imaginative guesswork instead, going to the extent of quoting Karve's interpretation of the burning of the Khandava forest by Arjuna in the *Mahabharata* in substantiation. Karve who is an anthropologist has herself expressed reservations about the admissibility of the *Mahabharata* as historical material of any reliability as have other historians [Sharma 1983] but the authors seem to have no reservations about passing off imaginative conjectures as history.

The battle for supremacy of the Indian mind between the brahmins, Buddhists and Jains which raged over the better part of five centuries and which finally ended with the victory of the brahmins has much exercised the interpretative skills of historians and sociologists alike. Various explanations have been advanced as to the material basis of this ferment all lacking in substantiation by hard evidence. The authors too advance an explanation that most suits their mode of resource use framework, once again without any hard substantiation. There is a general consensus, however, that it was the tenacity of the caste system which was never seriously challenged by both the newer religions that led to the eventual triumph of Brahminism [Jha 1977]. There is general agreement that the caste system is an ossified form of the original division of labour arising after the early Aryan expansion into the Gangetic basin which must have worked efficiently in the particular conditions prevailing at the time. From the beginning tribes other than the original Aryans have been admitted into the fold at different levels of the hierarchy depending on their relative importance of reasons of maintaining the hegemony of this system over the newer areas being colonised.

The brahmins faced with the Buddhist challenge finally even took to assimilating the belief systems and deities of the vast labouring classes so as to give their religion a more popular appeal. Thus the eclecticism of Hinduism has arisen out of the brahmins' need to maintain their hegemony through the caste system rather than out of a need to accommodate ideas conducive to resource conservation when faced with a resource crunch as the authors imply. The resource crunch of the Gupta period more probably arose out of the consolidation of brahminism and feudalism, both of which considerably reduced the freedom of the labouring classes and consequently their desire for productive work. A considerable segment of the people were still residing on the fringe of settled cultivation with belief systems which ensured conservation of their resource base. As argued earlier these belief systems can hardly be taken to constitute a conscious ideology of ecological conservation. That these people had been able to retain their ecological niches is more due to the fact that they were marginal to the main activity of cultivation and trade and due to some fierce fighting and not because there was an ancient version of the modern day pacts of peaceful coexistence as the authors would have us believe. There is mention in the Puranic texts of the adivasis of central India successfully defying the might of the Guptas [Kosambi 1956].

The authors have spent the better part of the chapter on caste describing in detail some of the research work they have carried out

on a few peripheral castes in modern India to substantiate their thesis that endogamous castes were constituted consciously to conserve resource bases. Apart from the absurdity of drawing inferences about the ancient era on the basis of situations prevailing in modern times the authors themselves admit that their sample is statistically insignificant. The caste system and the idealistic philosophy of Hinduism have been major constraints on development in various spheres—cultural, economic and scientific [Chattopadhyay 1976] and are primarily responsible for the continued misery of a majority of the people in this country. Today when Hindu communalist forces are themselves engaged in a wholesale falsification of history to serve their own dangerously sectarian ends, the authors' attempt to give the caste system and Hinduism a cloak of legitimacy by falsely imputing to them a progressive resource conservationist ethic deserves to be severely condemned.

Astoundingly the whole medieval period extending over more than a millennium is dealt with in just two pages. This is all the more inexplicable as reliable historical material is available in plenty for this period and research into it has produced some of the best Indian history writing in recent years. A period which witnessed repeated invasions from central Asia, the consolidation of the feudal system, the development of a systematic landtax system, the development of a strong centralised bureaucracy, the expansion of external trade to the east and the west and the introduction of Islam into the subcontinent among other things must also have seen ecological changes and conflicts over resource use. There is evidence that in their hunts the Moghuls used to treat the adivasis and beasts on a similar footing. A whole forest would be encircled and then the diameter gradually reduced. The beasts would either be killed or captured and the men taken away to be sold as slaves in the west Asian markets [Moreland 1987]. This could well be a reason for the persistent tribal opposition to rajput and Muslim rule in central India some of which has been researched.

A major weakness of the book is the neglect of the land and water aspects of ecology. Their preoccupation with forests has led to the authors ignoring developments in the other two spheres of enquiry. The medieval period was marked by the development of some innovative and appropriate water and land management techniques. These techniques particularly tank irrigation were first developed in the 6th century BC. They were refined considerably over the years and reached perfection by the Gupta era. A system of tanks, diversion channels and flood canals was developed that was prevalent in the Chotanagpur area of Bihar, Uttar Pradesh and the Deccan [Sengupta 1982]. Then there is the famous western Yamuna canal constructed in the reign of Firuz Shah Tughlaq to force water from the Yamuna into the Chitung river and thus reduce the effects of drought in the Hissar region [Singh 1983].

There is a very interesting example of adivasis in Orissa having developed an appropriate irrigation system. The Khond tribals of the present day Bolangir and Phulbani districts who are a subtribe of the Gonds developed this system in the 16th century AD. A system of percolation tanks, diversion weirs and channels were used to take advantage of the sloppy terrain to conserve the natural run off and also to utilise the flow of the larger rivers such as the Mahanadi. This system required the participation of the entire community to keep it in good repair and so was a typical example of the tribal way of life. Unfortunately modern irrigation practices have led to this system being destroyed and consequently this once fertile area has now become drought-prone (Chhotroy). There are many such instances such as the tanks of Gujarat and Rajasthan [Mishra 1993] and the Haveli system prevalent even today in the Bundelkhand region of Madhya Pradesh. These are only a few examples that underline the need for extensive original research into the history of land and water management practices.

India has a long coastline which has given rise to a flourishing maritime culture with fishing and shipping for its material base. Their uttes dependence on the vicissitudes of nature makes these people great conservationists. In recent years some of the most militant mass movements have been initiated by fishermen whose livelihoods have been threatened by modern industrial development. The study of the history of this culture should provide some interesting insights. In short there are many more aspects to ecology than just forests and an agenda for future research must reflect this rich diversity.

Colonial Encounter and After

This is the best part of the book as the authors are on familiar ground. Apart from reviewing the results of recent research on the ecological impact of colonial and industrial expansion worldwide the authors own pioneering research into the history of British forestry has been included. Especially interesting is the early environmental debate within the colonial bureaucracy as to whether communities living in proximity to the forests should be allowed their traditional right of access which is described at some length. The debate predictably ended with the votaries of people's rights being overruled by those who favoured the sequestering of forests for commercial exploitation and the passing of the draconian Forest Act 1878. The devastating effects that the expansion of the railway network and the two world wars had on the forests of India has been well portrayed. The colonial foresters had little understanding of the ecology of tropical forests and so apart from the damage caused by commercial exploitation wrong practices of selection and promotion of particular species too caused considerable destruction.

The authors then proceed to deal with the peasant and tribal opposition to the British usurpation of their traditional rights. Their treatment, however, does not do justice to

the widespread nature and gloriousness of this opposition which far exceeded in militancy and threat to British rule any other protest by any other section of society. The tribals of the Chotanagpur area and the Bhils of western India proved a thorn in the flesh of the British throughout the 19th century but find no mention despite their histories having been chronicled at length by many researchers, among them some who are colleagues of one of the authors in the subaltern school. The numerous peasant movements, especially the Telengana movement in which there was a bewildering variety of groups and issues, need to be studied again to determine their ecological bases. The authors have gone on to show how the colonial principles of forestry were pursued, even after independence, to satisfy the interests of the ruling classes intent on following a path of modern industrial development. Interestingly this clearly Marxist analysis of the nature of the state in independent India enables them to arrive at a proper understanding in contrast to the preposterous conclusions they had reached from their earlier analysis of ancient India on the basis of their own modes of resource use concept. Finally they have ably exposed the hollowness of the forest department's claim of being scientific in its practices.

The authors have said in the prologue. "Ultimately, the ecological history of India must be constructed around detailed regional studies, sharply bounded in time and space. Yet there are periods in the development of scholarship when a new interpretation cannot endlessly await the steady accumulation of certified data. Indeed, to plot the pieces of a jigsaw puzzle one must begin determining the shape and structure of the puzzle". True, but surely there must be some threshold amount of data for credible theorisation to be possible. They have picked up some facts and ignored a lot of others relating to forests alone, laced them with a liberal dose of imagination and constructed a theoretical framework. Into this straitjacket they have then tried to fit the immensely rich and diverse ecological history of India, most of the facts of which still remain to be discovered. The writing of a specialised history has to be a vast collaborative effort spread over a long time and in the case of ecological history would have to involve much sifting of primary source of material. There is the example of the Cambridge Economic History of India which is still being written after all these years. The authors have approached their project in the cavalier fashion of a writer of light historical novels rather than with the rigour that it demands. No wonder the blurb on the back cover says—"...easy, engrossing reading...", novels always are so.

Clearly the authors have been impatient and overambitious. Their area of specialisation being the forest history of colonial and independent India they should have contented themselves with producing an authoritative work in this field. To do this they would have had to include far more of the results of recent anthropological and historical research than they have done in the present effort. In so doing they would have had the reality of capitalist exploitation of both man and nature more forcefully driven into their understanding of the reasons for profligacy in resource use. This would in turn have obviated the need to cook up a dubious theory of ecological history in which both capitalism and socialism are considered as being equally profligate in resource use. They would thus have been saved the trouble of having to find an ecological justification for the reprehensible caste system, an act that has taken them dangerously close to Hindu communalist thinking. It is quite likely that the deeper study entailed would also have revealed to them the important role that women have played in the conservation of nature an awareness of which is almost totally absent from their present work. Indeed in their discussion of the Chipko movement there is surprisingly no mention of the valiant women of Reni who started it all despite one of the authors having written a book on this movement. Above all they would have realised that the reason why "the Indian environmental debate has taken an altogether different track from its western counterpart" is that not only are "cultures in conflict" but more importantly poor marginalised people are in conflict with forces that seek to deprive them of their livelihood. Their struggle rather than suspect theorisation by armchair historians is what is more likely to give rise to "a new mode of resource use and a new belief system to hold our society together" if ever that happens.

Kosambi in his preface to his classic, *The Culture and Civilisation of Ancient India in Historical Outline* written in 1964 speaks of the undoubtedly greater importance of making history rather than writing about it. He goes on to say that people who used at one time to believe that by electing representatives to debate in parliament and impose taxes on them they were themselves creating history had become disillusioned. Such people had begun to suspect that unless something more drastic was done soon, the whole of history would come to an end with the nuclear age. What he said then has, if anything, gained in validity over the years. The emergence of an unipolar world dominated by MNCs has been triumphantly labelled as being the end of history by the American historian Francis Fukuyama who feels that no further conflicts of any consequence remain. We in the third world know otherwise, threatened as we are with droughts, floods and other calamities resulting from ecological devastation. The horror of Bhopal is still too fresh in our memory.

Kosambi began his painstaking research in Ancient Indian history almost half a century ago revolutionising all subsequent history writing in this country. Today when we are faced with the prospect of steering a course through the uncharted seas of ecological history we only have to add bits and pieces here and there to Kosambi's basic precepts. He made an innovative adaptation of the Marxist method developed in the European setting, to the bewilderingly more complex Indian situation with profit. We too in our study of ecological history have to adopt this basic method adding to it the ecological and feminist perspectives which are lacking in it. This applies to both the writing and making of history. The experience of the ongoing struggles against destructive development have driven home this point as nothing else has ever done. In the premier such struggle today, the fight against the Sardar Sarovar dam being built on the river Narmada, the majority of activists had initially started with a Gandhian perspective of mediation within the established state structure. A rethinking has been forced by the unrelenting forces of national and international capitalism. That is "the anomalies that exist in Gandhi's thought and practice" have come to the fore here too and the ghost of Marx has begun troubling these modern day Hamlets. Whether they will be able to synthesise the positive aspects of the thought and action of these two thinkers (actors), give proper direction to the ongoing struggles and avert the impending "end of history" only the future can tell.

Cambodia: Proxy Battlefield

M G G Pillai

The Cambodian peasant has a long memory with an instinctive distrust of anyone who harmed their King Sihanouk. The recent flight of Prince Chakrapong after a failed coup attempt is irrelevant, but underscores the tenuousness of Cambodia's experiment with democracy

PRINCE NORODOM CHAKRAPONG's melodramatic flight to Kuala Lumpur after a failed coup d'etat in Cambodia early this month diverted attention from the quiet, inevitable power struggle now under way. His father, King Norodom Sihanouk, suffers from a terminal, irreversible cancer; his death would unleash a power struggle among the main groups, and their foreign backers. Prince Chakrapong is the first casualty of that. Doubts exist if the next king, almost certainly the co-prime minister, Prince Norodom Ranariddh, would be as politically astute, and nimble as his father to maintain the peace, adding to the worries and uncertainties.

The Cambodian government, democratically elected but a hotch-potch alliance between the once pro-Vietnamese Hun Sen and the pro-royalist Prince Ranariddh, remains of doubtful legitimacy so long as the strongest military and political group, the Khmer Rouge, remains out of it. The Cambodian National Assembly's moves to ban it underscores not to force it into the wilderness but to prevent it from bidding for power. But that is easier said than done. King Sihanouk is against it: The Khmer Rouge remains too powerful a force to be disbanded by, legislative fiat. But more important is China's quietly continual backing for it. Cambodia remains a proxy battlefield for Sino-Vietnamese differences.

If the Cambodians had been allowed to sort out their own problems, the Khmer Rouge would almost certainly have been coerced into the administration. Washington's threat to withhold aid if the Khmer Rouge joined the government destroyed any chance of that. But what Cambodia needed was a government of national reconciliation, not the continuing of perceived vendettas. So, the coalition government under Hun Sen and Prince Ranariddh was established with much international fanfare but with studied ill-acceptance by the country at large. The electoral process itself was to let the world know about the new epoch of democracy in yet another war-torn dictatorial country, not to ensure that peace had returned after two decades of war. What it did bring was the collective finger pointing now from those very groups now wringing their hands in despair that democracy has not taken root.

Once the government was in place, the expected promises of aid dried up. The superficial attempts to have a free press, a western form of judicial trials, commitments to 'human rights' and other moral issues dear to the west had greater prominence in the new government than such mundane but necessary steps to bring the country under a national banner. King Sihanouk's presence helped it to some degree, but Cambodia has been the battlefield, and continues to be, to resolve the bilateral problems involving other countries: The US to root out the Vietnamese in the 1960s and the early 1970s; China's diversionary flank in Vietnam's underbelly. But all this is forgotten or ignored.

The failed coup d'etat, and the embarrassed response to it in Phnom Penh, therefore weakens the foundations, with the Khmer Rouge more than an interested spectator. The ebullience with which the west hailed Cambodia's return to 'democracy', with the United Nations being vigorously patted on the back for a job well done, ignored a fundamental fact of Cambodian life: Prince Sihanouk's return home to die ensured the peace. Buddhist tradition demands that their kings die in their beds after their fifth lustrum of 12 years. That ensured the peace, not the western pressure to superimpose democracy on a country ill-prepared for it. The underlying problems caused by King Sihanouk's illness now accentuates the current fears of uncertainty and fear, but that comes from the latent weakness of the government, a strong well-disciplined group outside, and a fear of what could happen if the fabric breaks down again.

The Khmer Rouge remains the best organised force in Cambodia, with Chinese backing, and a constant threat to the government in Phnom Penh. The musical chairs is irrelevant without the Khmer Rouge's participation. King Sihanouk's opposition to banning it stems from cultural factors ill understood by the outside world. The Cambodian peasants rever their king, and any one who helped him in his trials and tribulations. When the US helped the Cambodian armed forces chief General Lon Nol, to overthrow Prince Sihanouk in 1971, the Khmer Rouge avenged it four years later by overthrowing the Lon Nol regime. This is why the Khmer Rouge has much support in the Cambodian countryside. That it is also brutal is irrelevant in a country long used to brutality from all sides, including the government.

Besides, the government in Phnom Penh remains one whose writ rarely ventures too far from the city centre. The presumption that it could do what it likes, so long as it has a democratic veneer, is fallacious. King Sihanouk understands this, with the widespread powers given him under the latest constitution used to great effect to ensure governance as an instrument of national policy, not to settle petty scores. But these problems have to be worked out within the framework of its internal cultural, social and other values. Superimposition of alien values and forms does not resolve the issue.

That those who shouted the loudest for Cambodian democratic practices are also those who would not dip into their coffers to help it along underlines the dilemma made worse by differing perceptions of what they mean. Rabindranath Tagore, once said: "God has given a different question paper to each country, copying won't do. One has to find out answers on one's own." An Indian politician recently paraphrased it thus: "Every nation has its traits, habits, parameters for value judgment, its own way of looking at things and formulating opinions, and means of adoption or rejection".

Cambodia remains a 'march' (The word means the territory controlled by a German count) for Sino-Vietnamese animosities, western justifications for their political morality and a springboard for criticism and censure when these political morals clash with local political homilies, amidst a stentorian monarchial effort to be independent in its own way. The native political character is superficially weeded out, but the new system is not strong enough to prevent the return of traditional values and forces. What happened in 1970 may be historically justified, but the Cambodian peasant has a long memory, with an instinctive distrust of anyone who harmed King Sihanouk, their 'devaraja', or god king. Prince Chakrapong's fate, therefore, is irrelevant, though his actions underscore the tenuousness of Cambodia's feeble, and seemingly irrelevant experiment in democracy.

REVIEW OF POLITICAL

Marx's First Critique of Political Economy, 1844-1994

Paresh Chattopadhyay

This year marks 150th anniversary of Marx's first critique of political economy, the Economic and Philosophical Manuscripts. *Even at this early stage of his critique Marx was profoundly aware that human emancipation cannot be a rapid, short process.*

THIS year marks the 150th anniversary of Marx's immensely emancipatory Parisian manuscripts—Marx's first critique of political economy. Unknown for a long time, the manuscripts that Marx composed in Paris (hereafter *Manuscripts*) were published by the great Marx scholar D Riazanov in 1932. They comprise Marx's extensive reading notes on and excerpts from a very large number of economists, as well as what came to be called *Economic and Philosophical Manuscripts*, properly speaking. The *Manuscripts* in no way constitute a finished work. A part of them has been lost. On the other hand, many of Marx's crucial (theoretical) categories would be forged only later. Marx's vocabulary would also not remain exactly the same. Nevertheless the *Manuscripts* already constitute the "cell-form" of Marx's *Critique*, containing the latter's basic elements *in nuce*. In what follows an attempt will be made to present the basic ideas of this genial critique in barest outline as a way of remembering its 150 years.

I

Alienation in Hegel: Marx's Critique

After having delivered his first critique of juridical and political sciences via his critique of Hegel's *Philosophy of Right* earlier, Marx comes to his first critique of political economy in his *Manuscripts*. He announces that his work is based on "a conscientious critical analysis of political economy" (1973: 467).[1]

The concept of "alienation"—in the sense of separation of the product from the producer and product's domination over the producer as an autonomous power—is the "leading thread" (*leitfaden*), to use Marx's celebrated 1959 expression, of the *Manuscripts*, and, indeed, of the whole of Marx's critique of political economy, however "invisible" it might be to the superficial readers of Marx's so-called "mature writings".[2] The foundation of Marx's discussion of alienation and alienated labour is the Hegelian concept of "alienation"/"exteriorisation", though Hegel figures explicitly only in the last or "philosophical" part of the *Manuscripts*. Hence a word on Hegel's concept of alienation, associated with labour, and Marx's critique thereof in the *Manuscripts*, may not be irrelevant.

In Hegel human being's relation with nature, mediated by labour, gives rise to the "exteriorisation" or "alienation" of the essence of the individual in the object created by labour. Thus in one of his early texts he writes: "(a) In labour I make myself directly (the) thing, (the) form which is existence; (b) thereby I exteriorise (entaussere) myself of this existence (*Dasein*) which is mine, make something which is alien (*fremd*) to me and maintain myself in that" (1967: 217).[3] However, it is only in Hegel's *Phenomenology of Spirit* (1807)—the "birth place and secret of the Hegelian philosophy", as Marx calls it in the *Manuscripts*—that the concept of exteriorisation/alienation occupies a central place. In the *Manuscripts* Marx critically analyses the most essential aspects of Hegel's *Phenomenology*.

For Hegel the human entity is identified with self-consciousness. All alienation of the human entity is thus the alienation of self-consciousness. Consequently, the actual, really appearing alienation, is only the phenomenal form of the alienation of the true human essence, of self-consciousness, the reappropriation of the alienated objective entity appears, therefore, as its incorporation in self-consciousness. Marx observes that in *Phenomenology* Hegel's standpoint is that of modern political economy. "He grasps the essence of labour". He conceives of labour as the "essence, as the confirmation of the essence of the human being". He comprehends the "objective human being, true because real, human being as the result of his (her) own labour" [Marx 1966a: 67].[4] However, as Marx observes critically, the only labour that Hegel (the idealist) knows and recognises is abstract, mental labour.[5] "The *humanity* of nature and of the nature produced by history, the humanity of products of the human being, appears (in Hegel) only as the products of the human spirit, and, to that extent, as the products of the abstract spirit, *entities created by thought* (*Gedankenwesen*)" (1966a: 66: emphasis in original). Thus there is a complete inversion of the real process in Hegel.[6]

Apart from his idealism, Hegel also confuses the objectification of labour with the alienation of labour. "*Objectivity* as such is seen as an *alienated* human relation not corresponding to *human essence*" [Marx 1966a: 68: emphasis in original].[7] Hegel does not see that the objectified labour becomes alienated labour at a specific historical stage of human development and is destined to pass away with the disappearance of that stage.[8] Associated with this confusion is Hegel's 'one-sidedness': Hegel sees labour only as the essence of the human being through the external act of making nature the instrument of his (her) will, but does not see that under given social conditions "the human essence objectifies itself in an *inhuman* way", in other words, "Hegel sees only the positive and not the negative side of labour" (1966a: 65, 67: emphasis in original).[9]

It is in relation to his critique of Hegel on alienation that Marx praises Feuerbach. Marx considers Feuerbach to be the only one who has "a serious and critical attitude" to Hegel's philosophy, the only one who has made "veritable discoveries" and has "overcome (*uberwinder*) the old philosophy" (1966a: 62). Feuerbach's achievement—"great deed"—was to show that the Hegelian philosophy was simply religion transposed in thought and itself was an expression of human alienation. Feuerbach also founded materialism by making the relation between human being and human being the basis of the theory (in opposition to Hegel).

Marx's strong critique of Hegel and his praise for Feuerbach should not, however, mislead us into considering the *Manuscripts* as a simple Feuerbachian, anti-Hegel document. What Marx basically faults in Hegel is the latter's mystification of the real life process, its inversion, not Hegel's dialectic as such. By inverting the real process of human alienation Hegel's *Phenomenology* appears as the "hidden, mystifying critique, obscure to itself (*sich selbst noch unklare*), but insofar as it retains (*festhalt*) human being's *alienation*, it contains *all* the hidden elements of the critique, already *prepared* and *elaborated* in a way that goes beyond Hegel's standpoint, ...the elements of the critique of the whole spheres of religion, the state, the bourgeois life, etc" (1966a. 66: emphasis in original). Indeed, Marx finds the 'greatness' of Hegel's *Phenomenology* in its emphasis on the "dialectic of negativity as the moving and creating principle" (1966a: 67).[10] This fundamental aspect of the Hegelian dialectic seems to

have largely escaped Feuerbach who considers Hegel's "negation of negation" "*only* as the contradiction of philosophy with itself", whereas Marx considers this negation of negation as the "expression of the movement of history", though the expression is "abstract, logical, speculative, and not of real history" (1966a: 63; emphasis in original). In other words, Marx questions what he calls "abstract form of movement" in Hegel, not Hegel's dialectic.[11]

II
Alienation in Marx

(A) Commodity Production as Alienation

Marx develops the process of alienation beginning with the simple exchange process, exchange between individual owners of commodities. Commodity relation is not a relation of human being to human being as such, it is a relation between human beings as property owners. "The mediating movement of the exchanging individual is not a social, not a *human movement*, not a *human relation*, it is the *abstract relation* of private property to private property, and this *abstract* relation is *value*". Consequently, commodity exchange is integration of human beings within private ownership and thereby, it is an "external, alienated species-act" (1932: 532, 538: emphasis in original).[12]

Marx stresses that the exchange of human activity in production itself as well as of human products among individuals is a species-activity and species-enjoyment which really are social and social enjoyment. However, essence being the true community of human beings, the latter create the human community through the affirmation of their essence. This is the "social being which is not an abstract--general power against isolated individuals, but the essence of each individual, his (her) own activity, own life, own spirit, own wealth" (1932:535). The relation between human beings not as human beings but as private property owners—for that is what commodity exchange amounts to—is an *inversion* of this natural relation. Human society considered as a 'commercial society'—as political economy would have it—is a society of individuals where individuals' own creation appears as an alien power, own wealth as poverty, the individual's separation from other individuals as the individual's real existence. "The individual's own power over the object appears as power of the object over the individual; master of his (her) production, the individual appears as the slave of this production." Thus it is clear how "political economy *fixes* the alienated form of social intercourse as the *essential* and *original* ('wesentliche und ursprungliche') form corresponding to the human mission ('bestimmung')" (1932: 536, 537: emphasis in original).[13]

In the *Manuscripts* Marx is not so much concerned, with how value is formed as with showing how value is simply an expression of alienated labour. To develop his own critique Marx starts by stating the position of the bourgeois economists. Thus Marx states two opposite positions on the 'definition of value'—without showing any marked partisanship for either—namely, Ricardo's on the 'cost of production' and Say's on 'utility' (1932: 493).

Marx cites Ricardo's *Principles* to the effect that labour is the source of all values and that its relative quantity is the measure that regulates the relative values of commodities. Marx refers to Ricardo's identity between 'exchange value' and 'natural price'—where the latter signifies the cost of production—and Ricardo's neglect of any difference between them, supposed to be only "momentary and accidental". Marx, indeed, faults the "entire Ricardian school" for inverting the (bourgeois) reality by unilaterally insisting on the 'law' of determination of value by cost of production and neglecting "another law which is no less constant" showing continuing disparity between cost of production and value leading to only "temporary balance between demand and supply". In other words, the law (formulated by the Ricardians) exists only through its continual abolition. "In political economy law is determined by its opposite, the absence of law" (1932: 530-31).[14]

Now value contains surplus value, and Marx highlights political economy's preoccupation—as seen in Ricardo—with "net revenue"—that is, surplus value (the term is not yet there)[15]—and neglect of "gross revenue". In Marx's view this amounts to belittling life itself whereby political economy reaches the "summit of infamy". At the same time Marx admires the "cynicism of Ricardo, cynicism without any human illusion", precisely because Ricardo's thesis is the "cynical expression of the economic truth" (1932: 514).[16]

Coming to money, Marx argues that the abstract relation between private properties, which is value, really exists as such in money. With the development of exchange, the product of human labour more and more takes the significance of an equivalent as the producer no longer exchanges a simple surplus but an object which is of indifference to the producer, and the latter no longer exchanges the product directly against another that is needed. The equivalent takes its existence in money which is now the immediate result of the gainful activity, and the mediator of exchange (1932: 532, 540). "The objects, isolated by the mediator, lose their value. Only insofar as they represent the mediator they have value, whereas originally it seemed that it had value only insofar as it represented them" (1932: 531, 532).[17] Through this alien mediator one perceives one's will, one's activity, one's relation to others as a power independent of oneself and others. Thereby the individual's slavery reaches its summit. The cult of this mediator turns into an end in itself. All the characteristics belonging to the species activity of the human beings are transferred to this mediator. "Man becomes poorer as man—that is, separated from this mediator—the richer this mediator becomes" (1932: 531).[18]

Marx praises the "modern political economy"—that is, classical political economy (the term is not yet there)—for understanding the nature of money in its abstraction and universality against the "crude superstitious belief" of the mercantilists that the nature of money belongs exclusively to the yellow metal. However, modern economists have their own superstitions however 'refined'. Both the superstitions have essentially the same root. Those who attack the 'monetary system' do not attack the latter's essence but only a specific form of this essence. "The metallic existence of money is only the official and palpable expression of the money-soul ('geldseele') which informs all the members of production and all the movements of the bourgeois society" (1932:533).

The value of money is inversely related to its exchange value or to the monetary value of the matter in which it exists. That is why paper money and the different forms of paper representation of money constitute the perfected existence of money and a necessary movement in money's progress. However, with money's progress in different forms, new illusions arise. The utopians like the St Simonians thought that the modern credit system had abolished the earlier alienation between human beings by destroying the material mediation between them and re-establishing direct relation between them. But this is an illusion. Rather the opposite is the case. Indeed, having no longer a material existence but a moral existence in the form of mutual confidence between human beings, alienation has reached its completion inasmuch as under the appearance of mutual trust there is the supreme mutual distrust. "The medium of exchange has of course returned from its material form and re-established itself in the human being, but only because the human being has displaced himself outside of himself and become himself a material configuration ('gestalt') ...The human individuality, the human moral, has itself become an article of trade as well as the material in which money exists" (1932:533).[19]

In a word, Marx underlines that in commodity production the product of labour is opposed to the labourer as an alienated being, as a power independent of the producer. The realisation of labour appears, in the world of political economy, as the devalorisation of the labourer, the

objectification as the loss and as servitude to the object, the appropriation as alienation, as exteriorisation. (In this sense Hegel's standpoint is indeed that of political economy, as Marx asserts.)

(B) ALIENATED LABOUR AS BASIS OF CAPITAL

We now come to capital. Many of the elements constituting the building blocks of the Marxian construction of the capital-concept we already come across in the *Manuscripts*. Accepting the "premises of political economy" itself and starting with "an economic fact of the present" Marx deduces that labour (under capitalism) is reduced to a commodity and to the most miserable commodity. "The labourer becomes poorer, the more wealth he (she) produces, the more his (her) production increases in power and volume. The labourer becomes a cheaper commodity, the more commodities he (she) produces. The *appreciation* ('verwertung') of the material world is in direct relation to the *depreciation* ('entwertung') of the human world" (1966b: 76; emphasis in original).[20] The relation of the labourer to the alienated labour engenders the relation of the labourer to the capitalist.

According to the "axiom of political economy", which is only the theoretical representation of the bourgeois reality, labour is a commodity and wage is the price of this commodity. "The existence of the labourer is reduced to the condition of existence of any other commodity. The labourer has become a commodity: [Marx 1966b: 38].[21] At this stage Marx has not yet distinguished between labour and labour power (which he would start to do at the end of the 40s). However, he already analysis the basic contradictions of wage labour. Thus he underlines that while, on the one hand, according to political economy's 'definition' ('dem begriffe nach') the whole product originally belongs to the labourer, according to the same political economy, on the other hand, the wage that the labourer receives as its price is the smallest part of the product, just sufficient for living as a labourer, not as a human being, in other words, sufficient to perpetuate, not the humanity, but the "slave class of labourers". Thus, though "the point of departure of political economy is labour as the veritable soul of production, yet it gives private property everything and labour nothing" (1966b: 42, 85).[22]

Under capitalism alienation appears not only in the result but also in the act of production, within the productive activity itself. In the alienation of labour's object is only summed up the alienation in the activity of labour itself. "The labourer finds himself (herself) in the same relation to his/her product as to an alienated object... In him (her) labour the labourer does not affirm but negates himself (herself). The labourer has the feeling of being himself (herself) only outside of labour, and outside of himself (herself) in labour" (1962b: 76-77, 79). Wage, which is the "price of the commodity labour", is only a consequence of the alienation of labour.

There is a strict reciprocal relation between wage labour and capital. "Labourer produces capital and capital produces him (her)" (1966b: 87).[23] Marx faults the "political economist" for viewing the original unity between capital and labour as the unity between the capitalist and the labourer. The confrontation of these two 'factors' ('momente'), represented in two persons, the economists treat as contingent to be explained (away) by external circumstances (1966b: 115). Contrary to political economy, Marx emphasises the inherent contradiction between labour and capital. "Labour, the subjective essence of private property, as the exclusion from property, and capital, the objective labour, as the exclusion from labour, is private property as the developed relation of this contradiction" (1966b: 115).

At the time of the *Manuscripts* Marx had not yet forged the concept of 'double existence' of capital, that is, as production relation and as ownership relation (1962b: 456, 460), nor advanced the proposition that ownership relation arises from production relation (1966b: 177; 1964: 352). However, the basis elements of both are already stated in the *Manuscripts* fairly clearly. Thus, after citing Adam Smith's characterisation of the capitalist as having "a certain command over all the labour, or over all the produce of this labour, which is in the market at the time", Marx identifies 'capital' as "the power which rules over labour and its products" (1966b: 50), where he stresses that this power is an "economic relation" between the "exploiters and the exploited", and not a "personal relation" (as in pre-capitalism) (1966b: 72). That is capital is an exploitative *relation of production*.[24]

On the other hand, Marx characterises 'capital' as "private ownership over the product of another's labour" (1966b: 49), and, in general, "private property" comes to represent capital in the *Manuscripts*. (Marx had not yet made the crucial distinction between class private property and individual private property within capitalist private property.) At the same time he already stresses that private property *arises* from labour's relation of alienation. "(Capitalist) private ownership is the product, the result, the necessary consequence of *alienated labour*. ...Private ownership is deduced by analysis from the concept of *alienated labour*" (1966b: 84: emphasis in original).

The economic alienation—as manifested in alienated labour—is at the root of the other alienations which appear in religion, family, state, morality. Marx emphasises a very important aspect of the general alienation in capitalism, namely, the situation of the woman. In this society the "infinte degradation of man in regard to himself" is shown in the relation with respect to the woman, "prey and handmaid of communal lust". This is so because the secret of this relation is manifested directly, openly and unambiguously in "man's relation to woman", and in the way the immediate, natural, species-relation is grasped. "Man's relation to woman is the *most natural* relation of human being to human being. Therefore, in this (relation) is seen how far the *natural* behaviour of man has become *human*, how far the *human* essence has become natural essence for him, how far his human nature has become *natural* for him, ...how far in his most individual existence he is at the same time a social being ('gemeinwesen')" (1966b: 98-99: emphasis in original).

III
Beyond Alienation

The critique of alienation brings Marx to his discussion of the abolition of alienation—through the abolition of "private property" (that is, capital), the objective representation of alienated labour—and its replacement by "communism", a completely delineated, emancipated society. Before advancing his own idea of a communist society Marx disposes of two other types of communism advocated by some radical thinkers as emancipatory social projects. The first type envisages the elimination of private property as property in a few hands, and a universalisation of such property. It wants a universal levelling of personalities and talents, and a return—'against nature'—to the simplicity of poverty. This is the abstract negation of all culture and all civilisation. However, as Marx observes, the abolition of private property, thus envisaged, is in no way the real appropriation. Indeed, far from abolishing private ownership, the community as it appears in this model is simply "a community of (wage) labour with the equality of wage paid by the collective capitalist ('allgemeine kapitalist')" (1966b: 88).

The second type of communism is simply 'political'. It wants to abolish the state but it remains 'incomplete', it still remains within the limits of private property and dominated by it. It has grasped the 'concept' of private property but not its 'essence' (1966b: 99).

Communism ushering in the "true community" is envisaged by Marx as the "positive abolition" of private property, of human self-alienation and, thereby, as the appropriation of human essence by and for the human being. This is the most complete, conscious "return of the human being to oneself" as a social, that is, human individual, conserving all the wealth of earlier human development. Invoking Hegel's famous category Marx asserts that communism is the "affirmation as the negation of negation",

and as negation of negation—mediated by the negation of private ownership—it is the "appropriation of human essence" (1966b: 109; 115).[25] But it is not yet a "true positing (*position*)" inasmuch as its point of departure is private property, not yet itself. It is not communism as communism. "Socialism as socialism no longer requires such a mediation, ...just as the real life is positive reality, no longer mediated by the abolition of private property". Communism as the negation of negation is a real moment of human emancipation, a necessary stage of development of the "immediate future", but it is " not the end of human development" (1966b: 115-16).[26]

Even at this early stage of his critique Marx is perfectly aware that human emancipation cannot be a rapid, short process. To abolish the 'idea' of private property, communism as 'thought' is sufficient. However, the abolition of "real private property" requires "real communist action". "History will bring it about, and the movement will pass through a rude and long process" (1966b: 116: emphasis in original).[27]

We have been speaking of human emancipation through de-alienation in the *Manuscripts*. Of course, through the abolition of alienated labour, it is, in the first place, the labourers that are emancipated. However, Marx stresses that in the labourers' emancipation "is contained the general human emancipation", because the "whole human servitude is involved in the labourer's relation to production, and all relations of servitude are only the modifications and consequences of this relation" (1966b: 85).[28] In a profoundly dialectical way Marx observes that the labourers are not the only victims of alienation, and that the capitalists are also its victims. Alienation's "inhuman power" is exercised not only on the labourer but "also on the capitalist", and capital, as the configuration of alienation, reigns not only on the labourer and the products of labour but also on the "capitalist himself (herself)" (1966b: 50, 117).[29]

Thus communism, while emancipating the immediate producers in the first place, in fact, is a project for total human emancipation. In this profoundly liberating sense communism is really *humanism* (*pace* Althusser). It is the "true solution of the struggle between existence and essence, objectification and self-affirmation ('selbstbestatigung'), freedom and necessity, individual and species. It is the solved enigma of history" (1966b: 99). However, this emancipatory project is in no way a utopia supposed to appear following some pre-conceived model. Marx emphasises that through the contradictions engendered by alienated labour itself the present society already contains "all the materials for building the society in becoming" (1966b: 105).[30] The solution of the contradictions is an eminently *practical* task, it is in no way a task of knowledge alone. It is a "real task of life which *philosophy* cannot solve, precisely because it conceives of this task *only* theoretically" (1966a: 105: our emphasis). In other words, the task has to be solved only by "revolutionary practice", as Marx would emphasise in his well known *Theses on Feuerbach* one year later.

Notes

[Parts of the present article were earlier presented in a different paper at the meeting of the International Working Group in Value Theory on the occasion of the Eastern Economic Association Conference in Boston (March 18-20, 1994).]

1 Marx stresses that inasmuch as political economy does not exist without private property, "humanity exists outside of political economy" (1932: 449, 514). As we know, basically this idea about political economy always remained with Marx irrespective of the important distinction between the 'classical' and the 'vulgar' economists that he would make beginning with the late 50s. Political economy was always considered by Marx as a bourgeois science—as a representation of the capitalist reality. 'Marxist economics' or 'Marxist political economy' is a contradiction in terms.

2 'Alienation'/'inversion' as the basis of Marx's critique of capitalism in his early works has been very well discussed in H Reichelt (1973: 29-72).
A point of view totally opposed to the one argued in the present work is seen in the French philosopher L Althusser who after operating a total 'rupture' (*coupure*) between the 'young' Marx—the author of the *Manuscripts*—and the 'mature' Marx, concluded that the 'young' Marx "does not belong to Marxism" (1965: 81). The basic criterion of this operation seemed to be the supposed Hegelian spell on the "young" Marx. In a later work the brave structuralist shifted the cutting point three decades down Marx's trajectory, and observed that Marx would be real Marx (without any Hegelian admixture, that is) beginning only with 1875 (1969: 21)—which, of course, would mean the exclusion of Marx's manuscripts of 1857-1863—justly called *Capital's* 'laboratory'—and most of the three volumes of *Capital* as belonging to the real Marx. On the other hand, though we have basic differences with the Italian philosopher della Vople on Marx reading, we think he was correct to point out, in connection with the question of 'young' Marx, that it was only a 'young' David Hume who had composed the fundamental work *A Treatise of Human Nature* (della Volpe 1962: 108).

3 Marx was unaware of this text, which was published only in this century. The best account of Hegel's early writings, to our knowledge, is by G Lukacs (1954).

4 Hegel had, indeed, studied the classical political economy, particularly the works of James Stewart and Adam Smith, and was considerably influenced by them. This aspect of Hegel has been well brought out by P Chamley (1963, 1965).

5 Cf "Thinghood which gets its form in labour is no other substance than consciousness" [Hegel 1964: 151].

6 "When wealth, state power, etc, are conceived (by Hegel) as alienated human entities, these are seen only as their thought forms, as thought-entities, thus simply as the alienation of the *pure*, abstract thought... The *philosopher*—himself the abstract configuration of the alienated human being—sets himself as the (measuring) standard of the alienated world...the whole history of alienation and *repossession* ('*zurucknahme*') of this alienation is thus nothing but the history of the genesis of the abstract, that is, absolute thought, of the logical speculative thought" [Marx 1966a: 65; emphasis in the original]: However, elsewhere, Hegel does speak of *material* (non-spiritual) labour. For example, in a work which precisely had been the object of Marx's severe critique one year earlier, Hegel holds that in civil society, with the increase in the "accumulation of riches on one side, there grows, on the other side, dismemberment ('vereinzelung') and limitation of particular labour and, therewith, the dependence and destitution of the class linked with this labour" (1972: 207).

7 Therefore, in Hegel, "the *reappropriation* of the 'alienated, objective human essence, generated under the determination of alienation, signifies the abolition not only of *alienation* but also of *objectivity*, that is, the human being is considered as a *non-objective, spiritual entity*" [Marx 1966a: 68; emphasis in the original].

8 See, in this connection, Lukacs (1954: 611 ff) and Hyppolite (1965: 97 ff).

9 In an earlier work—unknown to Marx—Hegel does see the inhuman side of labour. Referring to the bourgeois ('civil') society he writes: "the existence of the individual is subjected to complete confusion and hazard of the whole. The masses are totally condemned to be dull, unhealthy and uncertain ('abstumpfenden', 'ungesunden und unsichern') labour of factories, manufacturing, mining, etc, that narrows the (individual) skill. The branches of industry which used to support a whole big class of people dry up ('versiegen') all at once because (of change) in method (of production) or a drop in prices due to the inventions in other lands, and this whole helpless mass is abandoned to poverty" (1967: 232).

10 In a fundamental sense one could say that Marx's critique of political economy is based on the "dialectic of negativity" that he had discerned in Hegel. This is the "rational form" of dialectics—that is, freed from Hegel's "mystification"—of which Marx speaks in his famous 'Afterword' to the second edition of *Capital*—dialectic which "in its positive understanding of that which exists includes simultaneously its negative understanding, its necessary downfall as a part of the flowing movement of every developed form". With almost three decades' distance Marx writes: "It is the bad side (in its struggle with the good side) which produces the movement that makes history" (1965: 89), and: "Putrefaction is the laboratory of life" (ibid 995, this appears only in the French version of *Capital*, non-reproduced in Engels's editions). Significantly, Marx advises the (vulgar) economists to "reflect on" Spinoza's famous dictum: "Determination is negation" (1962a: 623).

11 Almost three decades later Marx would not essentially depart from the position given here. In the 'Afterword' to *Capital* Marx, it is well known, observes that his "dialectical method not only differs from but it is also the direct opposite of Hegel's dialectical method". However, it appears that this "direct

opposition" uniquely concerns the "basis" (*der grundlage nach*) of this method, which is materialist in Marx and idealist in Hegel (This crucial expression is absent in the Moore-Aveling English version.) In fact, while rejecting the "mystifying side of the Hegelian dialectic", Marx stresses that this mystification has "in no way hindered Hegel from being the first to present the general form of the movement in a comprehensive and conscious way". It is in this text that Marx "declares" himself "openly" a "pupil of that great thinker" (1962: 27). At about the same time, in a different text, Marx takes even a sharper position. In one of the manuscripts destined for the second volume of *Capital* (but not included by Engels in the published version) Marx calls himself a "disciple" of Hegel, "my master" (1968 528). As to Feuerbach, within only one year Marx would make a fundamental critique of Feuerbach's materialism for its "intuitive" character, and for ignoring the side of "human activity, practice" and he would positively evaluate (Hegelian) "idealism" precisely for "developing"—albeit abstractly—the "active side" (1966a 139). We may add that two decades later in a letter to his friend Von Schweitzer Marx would hold that "compared to Hegel, Feuerbach is very poor."

12 "As human beings you have no relation with my object because *I myself* have no human relation with it . our own product has taken a hostile attitude against us (*hat sich auf die Hinterfusse gegen uns gestellt*). It appears as our property whereas, in reality, we are its property. We ourselves are excluded from the *true* property because our *property* excludes other humans beings" [Marx 1966b: emphasis in original]. Through the exchange, private property ceases to be the product of labour, the exclusive personality, of its owner. At the same time it has been put in relation of equivalence with another property "As an equivalence its being (*Dasein*) no longer is its own particularity Thereby it has become value and directly *exchange value* Its being as *value* is a determination *alienated from itself* (*eine entausserte bestimmung seiner selbst*), (a determination) that is different from its immediate being and external to its specific nature. It is only a *relative* being of itself" (Marx 1932 539). Here, we think, Marx brings out the double character of labour as well as the specific temporal form taken by the product of labour as value which he would develop later. Fifteen years later Marx would qualify commodity exchange and the corresponding labour in commodity production as "all-sided alienation" (1958: 37, 39, 54). It is well known that this would appear in *Capital* as "commodity fetishism". This, incidentally, shows how very weak is the argument of people who would like to build "market socialism" (without capitalism of course, *a la* Proudhon) As if a society of free and associated labour—for that is what socialism, the exact antipode of capitalism is—could be built on the basis of "all-sided alienation".

13 Marx adds that "so long as the human being has not recognised himself (herself) as human being and has not organised the world humanly, the *community* will appear under the form of *alienation*, (and) its *subject*, the human being, will appear as a self-alienated being" (1932: 536, emphasis in original) The same basic idea would appear in *Capital* thus: "The form of social life (process) will cast aside its veil of mist only when will manifest the work of freely associated human beings acting consciously as masters of their own social movement [Marx 1965 614]. (The last part of the sentence, "acting...movement" appearing in the French version replaced "under their conscious planned control" of the German edition See Marx 1962a 94.)

14 "In order to lend more consistency and precision to its laws political economy must suppose the reality as accidental and abstraction as real" [Marx 1932 504] Marx develops this theme in his 1857/58 manuscripts Value of commodities—"real exchange value"—determined by labour time, is the average value. Now the "nominal value or price or monetary value" of commodities—the "market value"—constantly oscillates around the average value Thus "market value equalises itself with real value through constant oscillations, being persistently unequal with itself", that is, "as Hegel would say, not through abstract identity but through continual negation of negation, that is, as itself the negation of the real value" [Marx 1953.56]. Marx here specifically refers to his 1847 Proudhon critique for having said the same thing.

15 Later, tracing the history of the concept, starting with the Physiocrats, Marx would note its identity with surplus value (1959 544, 562).

16 Marx would continue to hold the same ideas. Later he would note that "gross income is a matter of absolute indifference to capital which is uniquely interested in net income", and hold that Ricardo's principle of "production for production's sake" and, thereby, Ricardo's "total indifference as to whether the development of the productive forces would kill (*totschlagt*) the landed property or the labourer was not only scientifically honest but also scientifically necessary from his point of view" (1959. 106-107, 566; "gross income" and "net income" are in English in the original).

17 Cf "Originally money is the representative of all values; in practice there is an inversion, and all real products and labours become the representatives of money" [Marx 1953. 67-68].

18 "Money is the general inversion of *individuality* which it turns into the opposite, attributing characteristics to them opposed to their own .. It is the inverted world, the *confusion* and *conversion* ('verwechslung und vertauschung') of all the natural and human qualities" (1966b 129; emphasis in original).

19 Cf "The economists themselves say that human beings put trust in the thing (money) that they will not put in the persons But why do they put trust in the thing? Clearly only as objectified relation between persons Money serves the (money)holder only as 'social security'. Such a security is there only because of its social (symbolic) quality. It can possess a social quality only because the individuals have alienated their own social relation as an object" [Marx 1953: 78].

20 In a different manuscript, composed about two decades later but published only in 1933, Marx writes: "To the same extent as the social productivity of labour develops, grows the amassed wealth confronting the labourer as the *wealth dominating* him, as *capital*. The world of wealth confronting him expands as the world alien to him and dominating him; his subjective poverty, destitution and dependence increase in the same proportion in opposition. His *emptiness* (*entleerung*) and, correspondingly, that *fullness* (*fulle*) march together" (1969: 85-86; emphasis in original).

21 Marx drew his idea of labour as a commodity from the French economist Antoine-Eugene Buret, large extracts from whose book he cited in the manuscripts in French In one

of the extracts we read: "As a commodity labour must more and more lower its price. The labouring population, the sellers of labour, is necessarily reduced to the smallest part of the product. Is the theory of labour as a commodity any other thing than a theory of disguised servitude?... Why was labour considered as nothing but an exchange value?" [in Marx 1966b. 48].

22 Marx would later write about the bourgeois economists in a similar vein: "Labour is the unique source of exchange value and the only creator of use value. So you say. On the other hand you say that *capital* is everything, the labourer is nothing or simply capital's cost of production... While they (the economists) in the same breath declare, on the one hand, labour to be absolute, and, on the other, *capital* to be equally absolute, labourer's poverty and non-labourer's wealth as the unique source of wealth, they move permanently in absolute contradictions (1962b: 258; emphasis in original).

23 In two later manuscripts the same idea appears thus: (a) "Each one (the labourer and the capitalist) reproduces himself (herself) while reproducing the other, his (her) negation. The capitalist produces labour as alien; labour produces the product as alien. The capitalist produces the labourer and the labourer produces the capitalist" (1953: 362). (b) "Labour produces its condition of production as capital and capital produces labour... as wage labour" (1969: 85).

24 Marx adds: "The proverb of the Middle Ages, 'there is no land without the lord' is replaced by another proverb, 'money has no master'. In this is expressed the total domination of the dead matter over human beings" (1966b: 72; the proverbs are cited in French). More than two decades later Marx would write: "The domination of the capitalist over the labourer is the domination of the object (*sache*) over the human being, of dead labour over living labour, of the product over the producer" (1969: 18).

25 Basically the same idea would later be expressed in *Capital*, where the society following capitalism is envisaged as being ushered in through the "negation of negation", indicated by the "negation" of capitalist property and based on the "acquisitions of the capitalist era" [Marx 1962a: 791]. Incidentally, L Althusser found Marx's use of "negation of negation," referred to here, as an "imprudent formula", and approved of Stalin's "suppression" of this formula "from the laws of dialectic" [Althusser 1969: 22]. However, it so happens that even as late as 1881—precisely in the period of a de-Hegelised "real" Marx on Althusser's reckoning—Marx returns to this "imprudent formula" [see Marx 1974: 51].

26 That socialism or communism (they are the same in Marx) is not the end of human development—contrary to a certain vulgar idea about Marx's communism—is also clear in Marx's later writings. In his famous 1959 "Preface" Marx speaks of the end of "pre-history" of humanity with the disappearance of capital. That is, human history only begins with communism. In the *Gothakritik* (1875) Marx speaks of a first phase that is followed by a second phase of communism (that is, as far as he could very broadly envisage, without being a utopian). Nowhere he says that "a second phase" is the last phase of the Association, that is, it is the end of human development, the "end of history".

27 A perusal of at least the *Civil War in France* and the *Gothakritik* by Marx would show Marx's re-affirmation of the same idea of the necessity of a period of "prolonged birth pangs"—corresponding to a whole "revolutionary transformation period"—requiring "a change of circumstances and human beings" to arrive at the "society of free and associated producers". Contrary to the Marxist Vulgate, the seizure of political power by the working class was never considered by Marx as equivalent to a socialist revolution. As the *Communist Manifesto* asserts, the installation of the working class rule is only the "first step" in the revolution.

28 One year later Marx would write: "The proletariat can and must liberate itself. However, it cannot liberate itself without abolishing its own conditions of existence. It cannot abolish its own conditions of existence without abolishing all the inhuman conditions of existence of the present society which its own existence resumes" [Marx 1972: 38]. The same conviction is aired in Marx's last programmatic pronouncement—destined for the French workers—three years before his death: "The emancipation of producing class is that of all human beings without distinction of sex or race" (1965: 1538).

29 One year later Marx would depict the possessing class and the proletariat both as the "products of private property" representing the "same human alienation", but whereas the possessing class takes this alienation as its own power under the "illusion of a human existence", the proletariat feels destroyed in this alienation which it sees as the "reality of an inhuman existence". Referring to Hegel's *Philosophy of Right* Marx would add: "To employ Hegel's expression, the proletariat is a revolt against abjection within abjection." Therefore, "the proletariat while abolishing itself is bound to abolish its opposition: the private property", that is, the possessing class as well (1972: 37). About two decades later, referring to the "process of alienation of labour" which brings both the labourer and the capitalist under its subjection, Marx would observe: "From the beginning, the labourer is here superior to the capitalist, the latter is rooted in this process of alienation and finds in it his (her) absolute satisfaction, whereas the labourer, as its victim, is, from the start, in a relation of rebellion against him (her)" (1969: 18). What else is this but the "dialectic of negativity", society's "bad side" impelling the onward march of human development?

30 As Marx would write later: "If we do not already find in society, as it is, the material conditions of production and corresponding relations of circulation (propitious) for a classless society, all attempts at exploding the (present) society would be Don Quixotism" (1953: 77)

Class and Surplus Value

Towards a Re-Examination of Concepts

Vinod Vyasulu

This article examines the basic concepts of class and surplus value and attempts to evaluate them in the current context.

You may charge me with murder—or want of sense—
(We are all of us weak at times)
But the slightest approach to a false pretence
Was never among my crimes.
—Lewis Carroll.

IF the contribution of Karl Marx to economics can be viewed as a methodological one, it should be possible to re-examine the relevance of the method of historical materialism in the light of the historical experience of capitalist growth in the 20th century. Such a re-examination is possible only if Marx's contribution is seen as a scientific one and not as the Bible of a new religion to be accepted uncritically and unquestioningly

Marx's critique of political economy was developed in the second half of the last century: much has happened since. The 20th century has witnessed two world wars and several minor/regional wars; one major economic depression in the 1930s; the consolidation of colonialism in the early years and also its formal break up in the second half of this century; the establishment and break up of the League of Nations; the invention, and the use against civilians, twice, by the US, of a nuclear bomb; the appearance of the first 'Socialist' state in the USSR as well as its collapse; and a whole host of other equally important events too numerous to mention here.

After a boom in faith in central planning, in the earlier part of the 20th century, the current fashion is a re-discovery of the virtues of competition and free markets. It is against this complex background that I would like to begin a re-examination of Marx's theory of surplus value once again. This article, is written, if I may put it this way, in a Marx-friendly spirit. This does not mean that it is necessary to believe in and defend all that Marx wrote. Equally, it is not necessary to oppose it either, simply because Marx wrote it. This bias is best stated at the outset.

The article is organised as follows. Section II provides a brief overview of the basic concepts of Marx: Class and surplus value. Section III, in desperate brevity, elaborates on the historical concept of class in economic and geographic dimensions. Section IV develops some categories and a taxonomy for analysis and Section V develops some formulations and raises some questions. These are followed up in the concluding section, which may be said to begin the process of re-examination of these issues.

II

The theory of surplus value can be briefly stated.[1] Marx begins by identifying two classes in capitalist society or the capitalist mode of production. One class owns the means of production and the other depends on selling its labour power for its livelihood. The capitalist class uses the means of production it owns, hires labour from the working class, and engages in the production of commodities for sale. This is the circuit of money: M-C-M, as contrasted to the earlier circuit of goods: C-M-C, which started with goods, not money.

In the process of capitalist production, labour produces value which is sold as a commodity in the market. It is here that the unique insight of Marx comes in. He points out that the value produced by labour can be broken into two components: One which is necessary for labour to maintain itself, and the other which is a surplus that becomes available because of the long hours worked.

Diagrammatically,

C' C B B'

Let AB be the length of the working day. The value of output is AB. Of this AC of output is paid out as wages—it is needed to hire labour. CB is the excess over this and it is the surplus value. This surplus value, in commodities, is sold by the capitalist and 'realised' in money. This matter of 'realising' the surplus—'marketing' in management jargon?—brings in its own complications.

Marx was the first economist to realise the importance of the length of the working day; and is thus a forerunner of the managerial school of business economics. He shows that the capitalist, by virtue of control deriving from ownership, expropriates this second part of the value added, which he calls surplus value. In Marxist analysis this is the scientific definition of exploitation, i e, the expropriation of surplus value by the capitalist of value produced by labour.

In normal usage of Marxian categories,

c = Constant capital or value of equipment, etc.

v = Variable capital or wages for maintaining labour.

s = Surplus value—commodities produced over and above what is required to maintain labour.

Total value = t = c + v + s

The rate of surplus values = r = s/v, and applies specifically to capitalism. It is the capitalist form of the more general concept of rate of exploitation. The value of r depends on the length of the working day, the level of wages, and the productivity of labour.

Another concept is the organic composition of capital or the relation of constant to variable capital in the total capital used in production, or $q = \frac{c}{c+v}$. This is a measure of the extent to which labour is provided with equipment, raw material, etc. The rate of profit = $p = \frac{s}{c+v}$, by definition it is the ratio of surplus value to total outlay.

It can be shown that p = s (1-q). Marx uses these concepts to explain simple reproduction, where growth rate is 0, and expanded reproduction, which is the norm in capitalist society, when investment is positive and capital expands via the process of accumulation.

This analysis is well known, along with the famous controversies such as whether the organic composition of capital remains constant; whether there is a tendency of the rate of profit to fall; whether values can be transformed into prices; the nature of capitalist accumulation, etc. Accumulation is the 'law of motion' of the capitalist mode of production; this is what makes it dynamic, nay, historical.

Based on an intense discussion of the nature of machinery and the working day, Marx shows that the surplus value extracted from labour can be increased in two ways. One, which he calls the extraction of absolute surplus value, is based on increasing the length of the working day. (CB'>CB in the diagram above). The second, which is the extraction of relative surplus value, is based on increasing technical knowledge which results in increasing the productivity of labour so that in a given working day the amount needed to maintain labour is produced in a smaller period of time and hence the

surplus value increases (C'B>CB) without the length of the working day having to be increased.

Based upon this analysis of the capitalist mode of production, a critique of the capitalist system was developed by Marx and his followers. It is important to remember that Marx analysed capitalism and not socialism or communism.[2] Socialism/communism was seen as a desirable end state which would come after the overthrow or downfall of capitalism. It was later writers like Lenin who contributed to the theory of building socialism; and that, in the light of recent events, has to be re-examined. But that is another story.

In what follows, I propose to elaborate further on the concepts of class, and surplus value and its extraction, from the perspective of the underdeveloped countries (and, in particular, India) in the 1990s. This will be the beginning of a re-examination of concepts; not its end.

III

There has been a strand in the literature which has argued that capitalism as a system may grow independently in each economy, which was interpreted at the level of the nation state. Thus there have been studies of the development of capitalism in Russia (by Lenin), in India and in other countries. Then followed a reaction from the world system school which argued that capitalism is a global system in which all countries or national economies had a specific role to play. In what follows, capitalism is indeed seen as a world system, even if it is not in the precise way defined by this school. Historically, as accumulation took place, capitalism, which may have begun in Europe, gradually encompassed the globe, often destroying earlier systems, or incorporating them in a subordinate manner. Also, the centre of the system has shifted from England, where it originated, to North America—and Japan/Europe, perhaps, more recently.

The studies in the middle of this century of Gunnar Myrdal, Raul Prebisch and Hans Singer are important in this context. Singer pointed out in a justly famous article in the *American Economic Review* in 1949 that the gains from trade are unevenly distributed across the developed and developing countries. Prebisch spoke of the centre and the periphery and identified Latin America as a part of the periphery. The price of Latin American exports—primary goods—fell, while that of its imports—manufactures—rose, in real terms. Thus Latin America was constantly losing from trade. Myrdal spoke of cumulative causation and backwash effects to explain uneven development. In sum, it seems to me that what these authors, and others who think like them, did was to add a geographical dimension to the analysis of the capitalist system. The class that Marx studied in the abstract was in reality distributed geographically around the globe.

While Marx divided the capitalist system in economic terms, into an exploiting and exploited class, Singer and others divided the capitalist system into a developed and underdeveloped part of the world.[3] The dependency school, largely from Latin America (scholars like Andre Gunder Frank, Dos Santos, Mauro Marini, Samir Amin and others) added the element of exploitation to this dimension by arguing that in a capitalist world the development of the advanced countries was one side of the coin, and was inherently and organically linked to the underdevelopment of the poor countries. Logically, this was analogous to the capitalist class expropriating surplus value; here the surplus value was siphoned off from one region to another, by the mechanism of colonialism/imperialism and later on via aid and trade. In this view, underdevelopment is a process of exploitation where the growing wealth of the rich countries depends upon the growing poverty of the poor ones. Thus, countries underdevelop. Before capitalism, the world was undeveloped; now it is both developed and underdeveloped as a result of the spread of capitalism. The development of some areas is linked to the under-development of others just as the wealth of the capitalist is linked to the exploitation of the worker. It follows that 'under-development' cannot be tackled in isolation; 'overdevelopment' has to be dealt with also.

In the light of experience, after the elaboration of these ideas, it is very clear that in the poor countries too it is possible and also necessary to analyse society in class terms[4] and rooted in internal dynamics. The causes for underdevelopment may be supported by external factors, but there is a local base as well. There are, in a country like India, antagonistic classes. There is an exploiting class whose nature needs to be precisely specified in each country. Loosely speaking, it may be said in India to consist of businessmen, large farmers, politicians, professors, bureaucrats, etc, who co-operate to rule and compete for benefits within that rule.

In the same way, the exploited class may be seen as consisting of different groups such as factory workers, marginal farmers and landless labourers, workers in the unorganised sector and so on.

It is indeed interesting that a scholar like Dandekar has argued that the exploitative class in India is the organised working class, and that it exploits workers in the unorganised sector in the Marxian meaning of exploitation.[5] In Dandekar's scheme there is no other, capitalist, surplus-value extracting group over and above the organised workers. His argument, in the 'unequal exchange' mould, links the power of organised unions to exploitation. Is it possible to use Marxian analysis in a way that builds upon these insights, including Dandekar's, ie, to integrate both economic and geographic dimensions into the process of extracting surplus value? What follows is a tentative effort in this direction. It goes without saying that much more work, conceptual and empirical, still needs to be done.

IV

If we introduce both economic and geographical dimensions into the Marxian theory of exploitation, we may get the following categories to work with:

(1) The advanced countries, such as the US, which have a strong capitalist class and also a strong working class. Over the years both have organised, but the capitalist class has developed strong institutions to look after its interest and has by and large managed to control the state which tends to promote the interests of capital, and whose vision is global.

(2) We have the third world countries like India, which are underdeveloped, vary greatly among themselves but which also have within themselves, both an exploiting class and a working class. The capitalist class is not necessarily homogeneous and consists of a coalition of landlords, politicians, businessmen, etc, only some of whom are strictly capitalist. It is, therefore, not as strong as the capitalist class in an advanced country like the US where the class consists largely of capitalists organised on the basis of class interest. India also has an exploited class, a part of which works in what is called the organised or modern sector, and which is organised in the sense of being of unionised. The second and larger part of the exploited class is dispersed across the country in both traditional economic activities as well as modern small-scale industrial units, generally using simple technology, which is not organised in unions and is referred to as an unorganised or informal sector. (V M Dandekar has forcefully argued that the first category exploits the second.)

This gives us the following taxonomy:

There is, in the global economy, an exploiting, capitalist class, with its own institutions, such as, on the economic front, the transnational corporations, and on the political front parties like the two major ones in the US. Through its influence on individual state institutions such as the US government or Congress, and international institutions such as the International Monetary Fund and the World Bank among many others,[6] it exerts a subtle control on the world economy. This class also generally controls the media and mass communication. It is this class which exploits labour in its own country through the use of modern production methods based on the results of science and technology successfully commercialised, as in assembly line manufacture or later, flexible specialisation manufacturing systems. Here exploitation is through the extraction of

relative surplus value; and the rate of exploitation, all said and done, is high. This does not mean wages are low.

This same capitalist class, through transnational corporations and their affiliates, has a global reach. Sometimes through the mediation of local exploiting classes in the third world countries, and sometimes directly, it also exploits labour in the third world. In this case, for the labour in the organised sector, exploitation is through the extraction of relative surplus value but often at a lower technological level than in the first world. And in the unorganised sector, where productivity is low because of the use of traditional technologies, exploitation is through the extraction of absolute surplus value through long working hours. Thus, both methods of surplus extraction coexist. In a way, pre-capitalist forms have been integrated into the capitalist system.[7]

Given the limitation on the availability of raw materials, such as oil, or the emerging constraints in ecology and environment, or rising levels of wages within its borders, the capitalist class finds it convenient to shift certain activities to third world countries.[8] This has been openly advocated recently by the then chief economist of the World Bank, Laurence Summers, according to a report in *The Economist* (February 1992). Such a shift of industrial activities may benefit the capitalist class in the third world countries. The nature of this third world capitalist class may be expected to vary from country to country. The literature uses the term 'comprador' capitalist, which may be true in some small countries such as Chile or Peru, where this class functions completely at the behest of the capitalists in the advanced world and identifies its interests with them, with no nationalist aspirations. Witness the role of ITT and other TNCs in the overthrow of Allende in 1973 in Chile. And there are several other such instances—United Fruit in Guatemala, for instance.[9]

In some countries the local capitalist class may have relative autonomy, the degree of which may vary. Today, the capitalist classes in Britain, France, etc, while not as strong as the capitalist class in the US, are still strong enough to assert their national character and interests and function somewhat independently in a limited sphere. The formation of the EEC is an effort to strengthen themselves. The Japanese and German capitalist classes have been steadily growing stronger in the 1970s and 1980s. On major issues, of course, they do not differ from the US capitalist class, e g, the recent get together against Iraq. But, in the Uruguay Round negotiations in the GATT, they had differences among themselves, while uniting against the developing countries. It is a case of both collusion/co-operation and competition/confrontation, based on the needs of the situation.

The nature of the capitalist class in India would appear to fall between these two extremes. At the time of independence, given the lead of people like Visvesvaraya, and after independence, of people like J R D Tata (both Bharat Ratnas), it would appear that the Indian capitalist class planned to use the state to strengthen its position as a national capitalist class. The main instrument for such an assertion of autonomy was to be the public sector.[10] It also used legal methods to strengthen itself against international capital—such as the MRTP Act and FERA. This is clearly set out in the Bombay Plan of 1944 and the socialist rhetoric of the 1950s and 1960s served it very well. Over the years, given changes in India and across the globe, it now appears that, having been considerably strengthened, this class is now willing to break free from the others who rule along with it and to function as a junior partner of the capitalist class of the advanced countries in some sort of global division of responsibility. That is the basis of the structural adjustment programme initiated in July 1991.

This class faces a small but well organised working class that has its own links with unions in the states and other developed countries. It will be noticed that through its organisation this working class has extracted many concessions in terms of wages and welfare. The existence of the USSR, where the working class won clear benefits and provided an ideological rallying point, played an important role in this. But it has not developed its consciousness and became what is called a class-for-itself. It has certainly become a class-in-itself, i e, it has developed a sense of identity but has not developed a high level of consciousness accompanied by an institutionalised method of fighting for its long-term class interest.

In a country like India the organised working class has also some of the features of the working class in the advanced countries, i e, a certain level of skill and a certain level of organisation, particularly in their unions. It sees itself as a part of the 'middle class' and has strong links with blue collar workers in the public sector and the banks. Its consciousness has been limited to what are called economic demands. There are also elements of degeneration in this class illustrated by the narrow views and completely selfish demands of, say, the government employees associations or the bank employees unions, which totally ignore the plight of other exploited sections of the population. This group is tremendously alienated. Perhaps this is the phenomenon that Marxists have termed 'false consciousness'. This matter needs deeper analysis. At a lower level in this hierarchy is the unorganised sector, a good part of which would also form what Marx called the reserve army of the unemployed.

V

This formulation raises a number of questions.

Is the unequal relationship between the capitalist class in the advanced countries and the capitalist class in countries like India an exploitative one in the sense that there is an extraction of surplus value from the weaker to the stronger? Or is this relationship to be understood in political terms as a coalition or an alliance for mutual benefit that is not an exploitative one? Just as Dandekar argues that organised workers exploit the unorganised, is it possible that advanced capitalists exploit the underdeveloped ones? Would this not be a mirror image of his argument?

In the same spirit, what is the nature of the relationship between the working class in the advanced countries, which is exploited through the extraction of relative surplus value, and the working class in a country like India, a part of which is exploited through the extraction of relative surplus value, and a part of which is exploited through the extraction of absolute surplus value? A part of this class also shows rent seeking behaviour.[11] The Dandekar formulation is that organised labour (which is itself exploited through the extraction of relative surplus value) constitutes the exploiting class and the unorganised sector the exploited class—the capitalist is nowhere in this model. To be logically valid, in Marxian terms, it must extract surplus value— how does it do this? Does it do so at all?

What would be the nature of the relationship between the working class in the advanced countries, which is relatively prosperous by third world standards in terms of its day to day life style, thanks to its higher productivity and union strength, and parts of the ruling class of countries like India? This becomes relevant in that the ruling class in a country like India has a component within it that is capitalist in the sense that they own the means of production. But other groups, who are also part of the ruling class, such as the politicians and the bureaucrats, belong to what is called the 'middle class'—they are educated, but do not own any of the means of production, i e, capital. They are part of the ruling class because they have a power base, for example, the politician who can win an election or a bureaucrat who administers controls. They are rent seekers rather than surplus-value extractors. However, they are maximisers of individual profit. Are they exploited by the richer working class in the advanced countries or do they form partners who should unite in a common struggle against exploitation by a specific, clearly defined exploiting class located in both parts of the globe?

According to Marxist categories as I understand them, what distinguishes the capitalist

or the exploiting class is its ownership of the means of production. The Marxian analysis has generally been agreed on this point. But given the experience of the (former) Soviet Union, does this formulation require any modification?

Could it be said that ownership of the means of production is a necessary but not sufficient condition in defining an exploiting class? If so, the other criteria that could go into the definition of a capitalist or exploiting class may be:

(1) In addition to the ownership of the means of the production, ownership of the means of knowledge, i e, control of R and D, which is often institutionalised in firms. The importance of technological knowledge has been analysed in the literature.[12] The discussions in GATT in the Uruguay Round, and the pressures on India to accept the international regime on intellectual property rights by repealing its own, well considered law on patent rights, make it appear that in the modern world, ownership of the means of production, i e, manufacturing capability in factories, is by no means sufficient to control the process of exploitation over a span of time.[13] The ability to design and develop new methods of production—what is called know-why, and to fund the generation of such knowledge within the class, appears to be an equally important characteristic of an exploiting class. In capitalism, the forces of production constantly improve; and controlling the factors that govern this capacity is clearly important. Perhaps it was implicit in Marx—but it needs to be made explicit now.

If this is so, one reason for failure of the Soviet Union would appear to be its inadequate control of know-why outside the defence/space sectors. It had always remained technologically behind the US. This would also provide a part explanation for the present turn about in India, where foreign collaboration is an article of faith. In fact, among industrialists and businessmen, the remark that a factory can be started without foreign collaboration is met with frank disbelief. The ruling class in India has begun to accept a subsidiary role to the capitalist class in the US because of the fact that though it controls the means of production in India, it does not own and control the means of knowledge. It has the know-how of production, but no know-why.[14] It, therefore, cannot compete in a world of monopoly capital, and its survival depends upon knowing its place in the global scheme of things. And that is a subordinate place. The new economic policy launched in July 1991 is meant to secure that subordinate position.

(2) Another point could be the fact that traditional Marxist analysis dealing with extraction of surplus value in the process of production has (by default?) ignored the financial side of capitalism. For example, the notion that services have no value. Control over the financial resources through the banking system also seems to be a means by which profits could be made. Hilferding and Lenin knew this, as is evidenced by their analysis of finance capital. But this strand of analysis has not been developed beyond the Baran-Sweezy analysis of monopoly capital in the US. Sweezy himself recognises this, in his note on *Monopoly Capital* after 25 years (*Monthly Review*, December 1990). It is particularly important in India where the services sector—and particularly the financial sub-sector—have grown tremendously in recent years. The current crisis is a financial crisis, and reform of the financial sector is a major part of the agenda of restructuring the economy. The two are closely interlinked, and this has to be carefully analysed.

The experience of international banks in the 1970s and 1980s makes it very clear that when finances on a very large scale are moved, large money profits could be made which have no counterpart in changes in the real sector of the economy. One has only to think of Eurodollars, petrodollars and third world debt—which was commercial/speculative activity by private banks. Examples of this can be seen in the fluctuations in the stock markets and exchange markets where large monetary profits in the short run are often made. This is the phenomenon of 'junk bonds', and together with the failure of the savings and loan associations in the US recently, it points to another important aspect of capitalist reality that may not have been adequately understood by Marxists. The loan melas of the 1980s, the loan waivers of 1990 and the disinvestment scam of public sector equity after July 1991 in India may be indicators of the importance of such factors and they need to be analysed and understood in depth.

At the end of the second world war, the capitalist class of the advanced countries, apparently with great foresight, set up financial institutions like the World Bank and the IMF to regulate international finances. The role of these institutions is to monitor developments in international finance in a way that will ensure profits for the banks and capitalists in the advanced world. These institutions, through their ability in mobilising vast sums of financial resources, can force economies to change their policies in favour of multinational capital through programmes of structural adjustments. In India certainly this can be seen in stark form because while there is no major crisis in the commodity-producing sectors there is a major financial crisis of the government which is forcing it to change its policies in a way that suits international capital.[15]

If this type of analysis has validity, then it would appear that an analysis of class society, if it has to be done on the basis of two homogeneous classes only, becomes inadequate in the highly developed capitalism of today. One would require at one end an exploiting class which (a) owns the means of production; (b) owns the means of knowledge; and (c) owns and controls the flow of finance or the means of finance, if one may coin a phrase.

A class which does not have at least these three features would only be quasi-capitalist. The Indian capitalist class is thus hampered by its political coalition with other groups. It does not control the means of knowledge (such technological know-how as exists is in the public sector, where many influences prevail). It only partly controls the means of finance—and that too, through the government via nationalised banks. This becomes clear from the fact that it was helpless in 1990 when the farmers lobby forced the government to write off their loans to the extent of Rs 10,000. Earlier, the government had diverted vast sums via the statutory liquidity ratio to itself and away from industry. All that the capitalist class could do was to protest in vain. But now, via structural adjustment, it is beginning to reassert itself with, to quote the Beatles, "a little help from my friends" in the IMF.

At the other extreme would be the informal sector of the developing countries which is at a low technology level, where people work for long hours, where exploitation is through the extraction of absolute surplus value. As this labour tries to better itself, it upgrades its skills and through the use of machinery by the local capitalist class, increases its productivity and the nature of exploitation slowly changes to the method of extraction of relative surplus value. In this process it interacts also with the organised working class. But the process is very slow, and given the levels of unemployment, it serves as a Marxian reserve army.

In the advanced countries this process of upgradation took place in historical time but in countries like India today labour at each level of exploitation coexists simultaneously. This calls for new strategies by those who would lead the struggle of this type of exploited class. That is an area where research is needed.

VI

In the same way, what are the necessary elements in the vision of a new and better society that is to be an alternative to capitalism? For one thing, as the Chinese cultural revolution teaches, a revolution is a process in time, not a single event, however dramatic and radical. Thus, one has to take a long view of this process. One does not have to wait for a revolution. One does what is needed now—struggle is continuous. The new society will emerge as a result of this continuous process of struggle and with many slide backs. Thus, the current dominance of capitation is no

reason for giving up struggle; but it is a reason for useful thought.

Recent events in east Europe and the former Soviet Union have added a new dimension that requires understanding. In what sense is the collapse of these countries a failure of Marxian theory and practice as many American papers and scholars now claim? Were these countries 'socialist' at all? If not, what can be learned from them? For example, for all the talk going round of turning capitalist, Russia today does not have a class of capitalists (of course, they may appear quickly!). But it does have a working class which is fairly well organised. To some extent, this working class, psychologically, may be like the blacks in the US after emancipation from slavery—slaves without a master. Can capitalism grow in such soil? At what cost? And to whom? The implications of all this are far from clear. The reality is the chaos in Russia. The need for fresh analysis is self-evident.

Further, experience teaches that central planning of the Gosplan variety has serious limitations even if it played an important role at a specific time in history. A post-revolutionary society will need to depend on market forces to adjust demand and supply, and to spread information between these two groups. Some competition, in this sphere, is essential, it would appear, for efficiency in sales and distribution. But the market must not be allowed to allocate all resources: there is need for planning in line with societal priorities.[16] And in this, scholars will have to build upon the work of Lange, Taylor, Kornai-Litpak and others. A distinction must be made between the market as force encouraging competition and reflecting consumer preferences, and the market as a *deus ex machina* in society.[17] The market may be a useful tool, but it is a bad morality. Sukhmoy Chakravorty used to comment that the market is a good servant, but a bad master.

Another relevant point seems to be that a post capitalist society must ensure participation in a democratic framework. If India has survived several crises, it is in large measure due to its democratic set up.[18] Centralisation and one party rule seem to run counter to people's expectations if the experience of east Europe is something to go by. Thus, open, democratic, decentralised decision-making is clearly a necessary condition for the survival of such a society. This again, is an area where the former Soviet Union failed. Here, India's experience with decentralised planning and panchayati raj may be useful. Marxists must learn from such historical experience.

Panchayati raj—and its urban counterpart—deal with self-governance at the local level; and this has many implications for India's federal polity. I would submit that a successful system is a necessary condition for any alternative society. Karnataka's flip-flops in this connection have many useful lessons to offer.

Another important dimension would be, I submit, a strong and healthy co-operative movement. While there have been major failures in this area, there have also been dramatic successes. The failure has always been linked to politicisation of an undesirable sort and to interference by government—the notorious Registrar of Co-operatives. Success is linked to a set of favourable factors including organisation, professionalism, etc. The NDDB, and IRMA, have done remarkable work in this field, and if the structure they suggest can be experimented with, it is likely to unleash rural energies in a very positive way.

Are there other necessary conditions? And what are the sufficient conditions? Quite honestly, I do not know.

These formulations would suggest major changes in the kind of strategies that would require to be followed by Marxists and socialists if the exploiting class is to be overthrown. It would necessitate a fresh vision of an alternative society, and clarity about how to reach it. It is a matter that requires serious debate, beginning with the proper formulation of the issues. If the point is not to interpret the world but to change it, then much remains to be done.

Notes

[This lecture delivered on July 12, 1994 was the first of what hopefully, will be Annual RBI Endowment Lectures at ISEC. This lecture is on a broad theme; these ideas have been evolving in the last few years in long innumerable discussions with my colleagues in the unit, B P Vani and Veerashekerappa; my Ph D students, Sukhpal Singh, Pooja Kaushik, A Indira and A V Arun Kumar; with A K Bagchi, N Krishnaji, T Krishna Kumar, A K N Reddy, D K Subramanian and many others and from the many questions posed by T S Kannan. Earlier versions were presented in seminars at the Centre for Development Studies, Trivandrum and at ISEC; and I have benefited from the comments of the participants at these seminars. In the last years of his life, V K R V Rao, at whose initiative this chair was established, provided valuable advice and invaluable academic support. In our work over the years, we were fortunate to have encouragement and support of T R Satish Chandran. We in the unit are grateful to them. The credit is widely distributed; the responsibility is mine alone.]

1 See, for example, Paul M Sweezy: *The Theory of Capitalist Development*, Monthly Review Press, New York, 1970. The brief discussion that follows is based on this. There are many good books on this, from the popular (Barrows Duneham, Maurice Cornforth) to the technical (E Mandel, M Morishima, M Desai), apart from, of course, the original by Marx.

2 The best description of the virtues of capitalism is perhaps in *The Communist Manifesto* of Marx and Engels.

3 Vinod Vyasulu, *The Paradox of Static Change*, Sterling, New Delhi 1977.

4 See the forceful argument of Ernsto Leclau, critiquing Frank, cited in Vyasulu, *loc cit.*

5 V M Dandekar, *Economic and Political Weekly*, January 5-12, 1980, and Ranjit Sau's reply, March 13, 1980 and the subsequent debate. See also Paul Sweezy's response to this position in *Monthly Review*, July-August 1979.

6 Organisations like the International Telecommunications Union or the General Agreement on Tariffs and Trade are important too.

7 See, Mark Holmstrom, *Industry and Inequality*, Macmillan, New Delhi, 1983, Vinod Vyasulu, *The Development of Backward Areas*, Yatan, New Delhi, 1988. The literature on this is large.

8 See Kannan Srinivasan, et al, 'The Orissa Aluminium Complex: Points for Debate' *Economic and Political Weekly*, December 5, 1981.

9 See *Corporations and the Cold War*, David Horowitz (ed), M R Press, New York, 1969, James Painter, *Guatemala: False Hope, False Freedom*, Catholic Institute for International Relations, London, 1987. Also Michel Chussdousky, 'Under the Tutelage of the IMF—The Case of Peru', *Economic and Political Weekly*, February 15, 1992.

10 See my essay '*Public Enterprise in a Restructuring Economy*'. To be published by the Lal Bahadur Shastri National Academy of Administration, Mussoorie.

11 See Ann Kruger's views in *American Economic Review*, June 1974.

12 For just one recent example, see Nathan Rosenberg and Lee Birdzell, *How the West Grew Rich*, Popular Prakashan, Bombay, 1987, and a review in *Economic and Political Weekly*, January 14, 1989 by Sukhpal Singh and Vinod Vyasulu. Also the writings of scholars like Denison, Galbraith, Baran and Sweezy, Stewart and others. Also important is Harry Breverman, *Labor and Monopoly Capital*, M R Press, New York, 1974.

13 The huge literature generated by the National Working Group on Patents (Chairman, Nityanand) makes this very clear. See also the balanced views of Deepak Nayyar in *Economic and Political Weekly*, February 8, 1992; my paper on the 'New Economic Policy and Technological Change' in *Economic and Political Weekly*, August 1993.

14 See, M R Bhagwan, 'The Capital Goods Industry in India' in *Economic and Political Weekly*, (1984).

15 See, T Krishna Kumar, 'Fund-Bank Policies of Stabilisation and Structural Adjustment: A Global and Historical Perspective', *Economic and Political Weekly*, April 24, 1993.

16 I C Patel, in his keynote address to the World Bank's Annual Conference on Development Economics (May 3, 1993) on the 'Limits of the Current Consensus on Development' is quite clear: "there is no obvious justification for limiting, such less eliminating, the so-called fiscal deficit unless one believes ideologically that all public investment is bad". This should be examined with the finance minister's statement at the Convocation of the National Law School in Bangalore on July 3, 1994: "We seek to reduce the fiscal deficit in our balance of payments". The ideological bias is not stated, but it is clear.

17 Recent events do not negate earlier theoretical results, reported, for example, in Francis Bator's analysis of market failure (QJE 1956), to mention only one. In his Nobel Lecture in 1972, Arrow writes that an efficient allocation of resources does not mean a just distribution. If the results of the market are unacceptable, what is needed is not a negation of the market but a new initial set of endowments. This level of sophistication is missing from the current market-friendly arguments.

New Institutional Economics, Marx and Marxism

R S Rao

While retaining the axioms of self-interest in the neoclassical economic theory, the new institutional economics brings in the role of collective action and to that extent binds the individual to the institutional framework. By questioning the propositions of a much talked about perfect competition and by suggesting that institutions do matter, it presents a framework for a new theory on the functions of capital markets in the developed world. The tool-kit thus developed in the west to help understand that system better could be useful in analysing economic institutions in India.

IN an article on the present structural reforms in India, K Basu makes an interesting observation: "I make no attempt to present a great theory of Indian economy and its predicament. This is because of the belief that such theories are impossible and the ones we encounter are illusions created by the skilful use of language."[1] However, the absence of such a theory, grand or otherwise, does not prevent Basu from reaching a conclusion in the article about the need for organisational and institutional changes in the country. Further, Basu also notes the difficulties of change, difficulties arising out of political constraints and bureaucratic impediments. In the absence of an attempt to theorise, proposing a testable, computable model of Indian economy is a difficult proposition.

One particular casuality in the teaching and understanding of economics is a consistent definition of development. I still remember, sitting in the class-room, when K V Ramana, the then young lecturer, was trying to articulate the meaning of development. Growth is not development, but is still not independent of it, leaving it, to an extent, an undefined concept. The confounded attempt to understand development and to distinguish it from growth continues to be a theme in most of the textbooks on development economics. Once the initial difficulty of defining development is overcome, the concentration of the subject revolves around locating the problems of the newly emerging nation-states like India within the broad parameters of mainstream economic theory of Keynesian systems using the neo-classical calculus The emerging economies are treated as another case of structural rigidities.

Scarcity of Capital

Though the mainstream economics defines the problems of economic theory as those of scarcity and allocation of scarce resources, in fact it deals only with scarcity of capital. The initial theorisation by Nurkse and others in the now familiar formulation—low income, low saving, low capital formation, low income—hinges on the reproducible means of production capital.

Development, or lack of it, is located within the parameters of scarcity of capital. As Stiglitz, one of the 'new institutional economists' observes, "A central question in developmental economics is—how can we account for differences in the levels of income and the rates of growth between developed and less developed economies? In the 50s and 60s there was a standard answer to this question. The poor are just like the rich except they are poorer/they have less human and non-human capital."[2] Given the backdrop of capital scarcity, development economics concentrated on creating conditions that favour increases in capital formation via savings. What also developed, in the process, was the need for state intervention in raising the rate of savings, capital accumulation, by public investment and/or by a suitable combination of monetary and fiscal policy. As a complement to such policies, the need for creating capital goods industry as a panacea to end the capital scarcity, at least in the physical sense, was felt. The savings had grown up from 10 per cent to 25 per cent but the capital-scarce economy continued to remain a capital-scarce economy, needing further doses of capital.

However, there is another stream within development economics which has capital scarcity as centrality but describes it not as an independent phenomenon but one dictated by the system. These models are the dual economy models where in addition to capital scarcity, labour abundancy also becomes a crucial determinant. In these models, one gets a rudimentary definition of development as a transition of a dual economy into a predominantly modern economy. The difficulty with these models is, once again, a lack of clarity in defining the traditional economy, its structure, agents and their behaviour.

It is left to the new institutional economics to try to define and model the agrarian institutions, a job not performed by the dual economy models. It should be noted here that this job of modelling agricultural institutions is done by introducing land scarcity in addition to capital scarcity of Nurkse and labour abundancy of Lewis. Now it appears, still without defining development but remaining within the broad parameters of mainstream economics, that the differences in per capita income and growth between countries is being located in the differences in the institutions.

Problems of Mainstream Economics

Mainstream economics, when posited against a given reality, particularly like that in India, faces three major problems. The first is the idea of instantaneous adjustment of exchanges. Mainstream economics deals with exchanges between individuals. The 'bazar' conception of the market where you go with a commodity/money and get money/commodity instantaneously serves as the backdrop. Most of the exchanges that take place, even including in the consumption sphere, but more particularly in the production sphere, involve time. It is like on what happens in the labour power exchanges where the labour power is exchanged for a period of one month in return for a salary at the end of one month, in a monthly salary system. In a casual daily labour system, the exchange of labour power from the labourer to the capitalist/landlord occurs during the day in return for the wage paid to the labourer at the end of the day. The time element involved in the exchange makes it a process of exchange and involves a preconception of the items of exchange and basis of exchange. Such exchanges need to be contracted in advance and the contracts need to be enforced. The enforcement mechanisms require institutions. For some of the Marxists, who treat exchanges as the centrality of economic theory, it is welcome to see the new institutional economics of the mainstream economics restore the primacy of exchanges in a sense more general than the familiar Edgeworthian exchanges. In the latter, however, state is taken as the institution of institutions with a monopoly of violence to enforce the contracts in case the contracts are violated by the parties.

The second problem with the mainstream economics is the definition of self-interest and the formulation of its translation into utility function. The familiar form is that the individual derives satisfaction from the bundle of commodities he consumes. The isolated individual's levels of consumption are only determinate in the particular context, to the extent that the valuation of the resources he exchanges with the rest of the society determine the levels of income at his disposal;

also, his vector of consumption 'q' gets determined in the social process, indicating the relative scarcities. While the isolated individual is constrained by the context of the society, the society too is constrained by the individuals. In the absence of a recognition of this social-individual interaction between the individual's perception and utility maximisation—a perception which is wished away with the idealised set up of a perfect competition and its attendant Paretian welfare theorem—even the minimum notion that people do, in reality, participate in collective action becomes a major arena of debate. Olson tried to grapple with this problem of collective action with individual self-interest as described above in both his books, *The Logic of Collective Action* (1971) and *Rise and Decline of Nation States* (1982).

Situated as he is, a majority of the actions of an isolated individual have an 'externality'. The major externality and the resultant collective action concern the state itself, and it goes partly to the credit of new institutional economics that it brings the state to the centre stage and attempts to endogenise it. As Bardhan observes, "But it is easy to see that we do not yet have a good theory of the formation, maintenance, and institutionalisation of ideology which can lend some regular predictive ability to a model of the role of ideology in institutional change. In propagation of ideology and the socialisation process, as in defining and enforcing property rights, the state plays an authoritative role."[3]

Closely related with the specification of utility function is the introduction of a behavioural assumption that all work is disutility and that individuals refrain from working but are desirous of increasing consumption. This is a useful assumption in rationalising, if not explaining, a sticky wage situation, a subsistence wage situation, and also unemployment. It creates the following types of problems. The first, as we shall argue later, are the problems of monitoring-supervising the disutilised labour. Since supervision also involves labour, which itself is disutility, it provides a hierarchy of supervisory labour, leaving in the economy a set of unproductive labour supervising the productive labour. The second problem in such a formulation is that since work income is accruing through displeasure and non-work income is pleasure, and assuming that income cannot come about without work (no labour theory of Marx please!), there is always a discord and dishonesty in the system about the relative shares of work income and non-work income, a discord which can be harmonised by either an ideology or the state power, without really resolving the discord, giving it a permanency. The axiomatic framework of disutility does not even permit a suggestion of an alternative framework or work condition where work is a pleasure and as such diminishes the role of property, creating the disutility for work.

Connected with the disutility of work but more problematic is the definitional framework of the technologically given production function. A production function is a necessary tool, has a status of exogenity, and is a derivative of the physical and natural sciences but has a restrictive significance in terms of choices available for the economic agent. It has two types of problems in characterising an economic agent. A capitalist has an understanding of the choices of technology in the sense of choosing a particular combination of capital and labour and choosing technologies for a particular product range. In a context of low level of technologies, it is possible to assume that the capitalist has an understanding of technologies, but in a period of high level of technology and changes therein, such an assumption is impossible to make and is, in reality, untenable as it leads to problems discussed in the new institutional economics literature, namely, problems of asymmetry of information and moral hazards or broadly the principle-agent problems. The second problem is a separation problem concerning technology, a separation of the ownership from its use. The 'l' involved in the production function is the power of labour to set in motion the machinery, and the use of raw material, physical exertion and energy losses. The latter is observable and homogenised and hence can be monitored by the capitalist who buys the labour power. The former is unobservable, non-homogenised and can only be judged retrospectively by the end product in production. Since it is unobservable, its measurement raises finer questions of monitoring and supervision. The capitalist buys the labour power from the labourer, which labour power cannot be separated from the labourer. It is here that the production function, from being a mere technological relation, turns into a social relation of controlling the labour power to produce and produce at its best.

Caste, Sharecropping and Scarcity of Land

One of the institutions that drew the attention of this school is that of 'caste' and the related social questions. G A Akerlof's papers concentrate on it. Though, 'caste' used by Akerlof is of a general order, specifying grouping of individuals on an extra economic basis resulting in segmentation or non-homogenisation of people, it includes the Indian caste system, and his brief description in his paper. 'The Economics of Caste and the Rat Race' also includes the marriage customs in India. The paper does not work at the formation of castes but deals with caste equilibrium and suggests that "The smallest equilibrium breaking coalition is the smallest group that can set themselves up as a separate sub-sector and be as well off as in equilibrium while trading with caste members on the terms of trade granted to outcastes. In situations where this coalition must be large, where trade with the caste economy is necessary, or where the cost of forming a coalition is high, the threat to equilibrium of such a coalition is small."[4] In another paper, using the social custom as an exogenously given datum—a failure to obey these customs giving rise to losses to the economic agents—he constructs his model of social customs by conveniently introducing into the familiar utility function arguments which internalise the externalities that come about in the self-interest based utility function. His utility function now represents, in addition to the vector representing the individual's consumption of material goods and services, his reputation in the community, his obedience or disobedience of community's behaviour, etc. Like the caste equilibrium, in social custom also the origin of the social custom is not defined but the stability of the social system is described all within the parameters of the mainstream theorising, except that the self-interested individual does respond to the institutional rigidities either of caste or of a social custom.

A lot of intellectual effort has gone into understanding sharecropping as an institution. Though most of the authors relate themselves to a footnote in Marshall's book, the authors do reflect on certain political policies adopted in the newly emerging 'nation states' like India, China, etc. These states in their initial enthusiasm, reflecting the internal contradictions and popular agitations, did include in their agenda a series of land reforms measures which included abolition of intermediaries, land ceiling and reform of land tenure, etc. In a country like India, these became reflections of people's movements like Tebhaga, Telengana, and a host of others initiated and conducted by the All India Kisan Sabha. While in the first 20 years, land reform legislation was tossed about between the different wings of the modern state apparatus, namely, judiciary, executive and legislature, it got a fresh impetus when the CPI(M) implemented these reforms in two states—Kerala and West Bengal—at least partially. The land reform measures acquired greater prominence when the CPI(ML) took up programmes of implementation of land reforms. Though the footnote in Marshall has attracted intellectual attention and debate, it reflects conditions where masses of people live at the reservation utility level, whose chances of getting absorbed by the capital industry are limited, keeping their opportunity costs low, and whose dependence on a weather-dependent, capital-starved, uncertain agriculture is high. In fact, it is these conditions which became handy in

suggesting sharecropping as a preferred arrangement, a set of conditions that did not exist at the time of Marshall, when capital was an expanding category at least in Europe and subordinated the landlord to its hegemony. The new institutional economics introduces the scarcity of land, in addition to capital scarcity; it assumes land to be sometimes relatively more scarce than capital. It adds further that the landlord is an economic agent receiving rent as a reward for the scarce resource in its participation of production activity. Further on, it assumes that labour is abundant. Under these arrangements, sharecropping is an efficient form of negotiated contract between tenant and landlord. As Eswaran and Kotwal observe, "Having determined the landlord's expected income under all three contracted arrangements, the determination of the arrangement that will prevail is, in principle, trivial: that contract would be chosen which maximises the landlord's expected income. Since the supply of tenants is perfectly elastic, any rents that are generated accrue to the owner of the resource, land: irrespective of contract, the tenant earns only his opportunity income."[5] The labour abundancy is reflected not only in the assumption of perfectly elastic supply of tenants, but also as Kaushik Basu observes, "There exists a labour market from where the tenant can always hire and sell labour at the fixed wage 'W'."[6] Having resumed sharecropping as one of the efficient tenurial arrangements, sharecropping as a preferred form is derived using interesting calculus. Following the usual neoclassical specification that work is disutility and worker basically is a shirker who wants to avoid work but wants income, supervision (monitoring) and costs of supervision become important transaction costs. The threat of eviction from the contract, in the context of the abundant labour, makes share-cropping, a preferred contract. As Bhaskar Dutta et al observe, "We inferred that in many rural situations where output is observable but effort is not, the employer (or landlord) will offer contracts that combine both current incentives and the threat to evict. In fact the latter is likely to co-exist with the former. For instance, land-lease markets should display a mix of 'sharecropping type' arrangements and short leases. In addition, it predicted that there should be an excess demand for land-leases at the going contractual rates, but this excess demand will be chronic and not a 'disequilibrium' state."[7]

Labour Market

The labour market in the Indian conditions gives a perverse reading when looked at from a perfectly competitive. model—the differences in wages between different labourers for the same and/or similar jobs; existence of two labour markets, the permanent labour and casual labour, with differences in wages; the existence of 'bonded labour' which looks similar to slave labour where the labour is sold but not the labour power. The state in general tried to intervene in the labour market, sometimes by minimum wage legislation, sometimes by employment guarantee schemes, and sometimes by legislation banning the bonded labour. The interventions most of the time are reflections of the internal contradictions inside the economy, reflecting sometimes the human values (welfare), sometimes the efficiency losses (unemployment of human resources), sometimes potential gains (release of productive forces). While such interventions are part failure and part success, depending on the response of the economic system locally, the attempt by the institutional economics was to see the rationality of the system of labour market as it exists. It is useful to look into two such attempts: the one by Srinivasan who suggests that "The policy of banning bonded labour will be unenforcible or, if forcibly implemented, will reduce the welfare of the sharecropper",[8] and the other by Eswaran and Kotwal on two-tier labour markets.[9] Srinivasan's bonded labour is a landless person who opts to become a sharecropper to the landlord, who gives consumption credit, and provides labour at less than opportunity cost. As in other cases, the bonded labourer does not have an opportunity of migration to urban areas with a higher and certain income. He does not have opportunities to get into production stream with a production loan for non-agricultural production. His agricultural incomes are also subject to random disturbances. His current account surplus/deficit is a random variable with expected value becoming zero. Given a positive rate of interest for a loan taken during the deficit year, the bonded labourer will be heading into a debt trap unless he either reduces consumption or increases his income. Since the latter option is closed, the bonded labourer has to sell his resource, the unutilised labour to the buyer, the only buyer available in the person who gives the credit, i e, the landlord, and this he does below the opportunity cost. In such a situation, Srinivasan gives an option, a choice to the bonded labourer to become unbonded, the choice being institutional credit. As the rules of the institutional credit go, even given all concessions like concessional institutional credit, no collaterality, etc, but with a simple suggestion that credit cannot be renewed at the second period unless first period credit is repaid, and no institutional credit can be repaid in terms of labour services, the bonded labourer prefers landlord rather than institutional credit and hence the conclusion—"Policies promoting technical change, if they succeed in making the post-change distribution of yields dominate stochastically over the pre-change distribution, may succeed in raising the incidence of bonded labour or at best not lowering it. Interest rate subsidisation may have a similar effect. Since, in the above model, the choice of a bonded labour contract is voluntary, it will be chosen by the sharecropper only if it yields him a higher life-time welfare compared with borrowing from the lending institution."[10]

Eswaran and Kotwal attempt to explain a significant puzzle in the labour market where the, "Permanent workers in Indian agriculture typically enjoy [*sic*] a significantly higher income than casual workers. In addition, permanent workers get consumption loan, homesteads and other patronage benefits while casual labour faces a great deal of uncertainty in the labour market."[11] The puzzle is as to why the landlord pays higher than opportunity income to permanent workers where casual labour is cheaply available. Eswaran and Kotwal resolve the puzzle by disaggregating labour into two types. The first type of jobs are those which require considerable care and judgment such as water resource management, application of fertiliser, maintenance of draught animals, etc. These jobs are such that the monitoring of work is difficult, and the 'moral hazards' of job shirking are heavy. The second type of jobs are what Eswaran and Kotwal describe as routine and menial [*sic*], such as weeding, harvesting and threshing, since these jobs are observable and hence are easy to monitor and enforce. Using the profit maximisation of the landlord and utility maximisation, the authors conclude, "Since a labourer strictly prefers being a permanent worker to being a casual worker, there will generally be an excess supply of workers seeking permanent contracts. This, however, will not result in a downward pressure on the permanent worker's wage, since any wage which is lower than the smallest Wp, say Wp (Wc, β), that satisfies (16) for given Wc and β, is not credible: it leaves an incentive for the permanent worker to shirk. A casual worker who seeks to obtain a permanent contract by offering to work for a wage marginally less than Wp will find that the landlord will not entertain the offer."[12]

Paradigm Shift

The paradigm shift brought about by the new institutional economics in the neoclassical economic theory, while retaining the axioms of self interest, brings in the role of collective action and to that extent binds the individual to the institutional framework. Put in a Marxian framework, the individual's being in an institution determines his consciousness. Given an inertia of the institutions, his choices become the consciousness. As Mathew observes, "[there are] sources of differences in income per-

head (1) between different dates in a given country and (2) between different countries at a given date. Some sources, like capital per head, are usually regarded as contributing in much the same way to both kinds of difference. But whereas people often say that inter-country differences, say between the US and the UK, reflect institutional causes to an important extent, it is not so usual to postulate progressive institutional improvement as a source of growth over time."[13] And as Stiglitz notes, "[If] the difference between LDCs and the more developed countries lies largely in matters of economic organisation, then the first item on the research agenda should be a better understanding of the micro economics of LDCs. What is needed is a theory of rural organisation, as well as a theory of industrial organisation focusing on the special characteristics of LDCs."[14]

This new paradigm owes its growth to two distinctively different streams of analysis, namely, the transaction costs theorists and information theorists. The fundamental idea of transaction costs is that they consist of costs of arranging a contract ex ante and monitoring and executing ex post as opposed to production costs which are the costs of exercising the contract. Institutions do arise to reduce the transaction costs or to tackle the problems of transaction costs. A costless transaction, an assumption built into the perfectly competitive market system, is relaxed to a great extent. Similarly, as the information theorist Stiglitz pointed out, "...there may be situations, particular markets in which information costs are low and in which traditional theory holds, the law of supply and demand, the law of single price remains valid. Our contention is only that there are many situations where information costs are significant and where the nature of market equilibrium is, as a result, significantly altered. To understand consumer and firm behaviour in these situations and to understand the consequences of various kinds of government intervention, requires an explicit analysis of how information affects the market equilibrium."[15] By questioning the basic propositions of a much talked about perfect competition and by suggesting that the institutions do matter, the new theoretical insights, however, do present a framework for a new theory on the functions of capital markets, defining functions of competition and economic organisation, etc, in the developed capitalist world. The crucial tools of this system are the uncertainty in production and marketing, and the inexactness of the exchanges and of the contracts, particularly labour contracts. In so doing the institutional theorists have assigned a lesser role to the state and greater role for the agents to bargain across the table, a peculiar form of withering away of the state.

New Institutional Economics and Marxism

The tool kit thus developed in the west to help understand that system better could be useful to the economists to explain/explain away the Indian economic institutions and also to understand the government interference. In the introduction to a book entitled *The Economic Theory of Agrarian Institutions*, Bardhan claims that "Marxists often cite some of these production relations as institutional obstacles to development in a poor agrarian economy, overlooking the micro-economic rationale of the formation of these institutions....Marxists have also a tendency to equate some of the pre-existing production relations mechanically with the 'feudal' or 'semi-feudal' mode of production."[16] As a person who tried to understand the Indian economy in a model of semi-feudal—semi-colonial economy, I thought it is best to look into this framework to get a greater understanding of the Indian economy.

The new institutional economics credits Marx and Marxists with an endogenous theory of institutions. The often quoted paragraph from the preface to the 'Critique of Political Economy' identifies the central driving force behind the institutions as the forces of production, whose movement forward enters into a contradiction with the property relations enlisting a change in the economic structure and institution. However, in an attempt to get over the violent overthrow of the system at central junctions of history, Marx is presented in a silly scenario. Contrasting his opinion with Marx, Hayami writes, "Basically we share Marx's view. However, we do not consider that institutional change is necessarily an abrupt and complete transformation of the entire institutional framework as described by Marx. The institutional framework and the property relations may change through cumulative adjustments."[17] Even a cursory reading of *Capital* or any of his other writings will not lend Marx to such an interpretation. Extensively analysed are the pre-capitalist institutions like usury, ground rent and how they undergo gradual changes for the use and benefit of capital. The institutions undergo changes in the image of capital and for the purpose of capital. It is also of some interest to note that Marx does perceive the problems involved in the process of exchange, particularly that of exchange of labour. He does notice the problem of supervision and monitoring. In an interesting passage, Marx writes, "The labour of supervision and management is naturally required wherever the direct process of production assumes the form of a combined social process, and not of the isolated labour of independent producers. However, it has a double nature. On the one hand, all labour in which many individuals co-operate, necessarily requires a commanding will to co-ordinate and unify the process and functions which apply not to partial operations but to the total activity of the workshop, much as that of an orchestra conductor. This is a productive job, which must be performed in every combined mode of production. On the other hand, quite apart from any commercial department, this supervision work necessarily arises in all modes of production based on the anti-thesis between the labourer, as the direct producer, and the owner of the means of production. The greater this antagonism, the greater the role played by supervision. Hence it reaches its peak in the slave system. But it is indispensable also in the capitalist mode of production, since the production process in it is simultaneously a process by which the capitalist consumes labour power."[18]

What is 'moral hazards' for the new institutional economics is the necessary class antagonism for Marx. Following Marx and using the 'capitalist consuming labour power' argument only, Bowles[19] constructs a theory of unemployment and the choices of inferior technologies and discrimination in the labour market without that suffocating description of work being a displeasure and the ugly worker being a moral hazard and the contemptuous description of homogeneous/observable work as menial. The difficulty of putting Marx within the neoclassical framework is that while the former tries to understand the reality with a view to change it, like all science does, the latter stops short of thinking of change and gets into the rationality of arrangements and behaviour, giving an impression of rationalising the system. Bardhan is aware of such a pitfall. He says, "While I have been an active participant in this literature, I am not sure if I fully share in its main focus or in the interpretation of its main message. Not merely is the thin line between understanding an institution and justifying it often blurred..."[20]

As Marx and Marxists were trying to understand a particular reality not in its equilibrium state but in its motion, their attempt always was and continues to be locating the classes in whose interest it is for the economy to be set in motion. Thus in their view, the problems of third world and definitions of development in such a context are always a motion from a pre-capitalist economy to the capitalist economy. Development is a transition, from a traditional economy to a modern economy, or from a pre-capitalist economy to a capitalist economy. Looking at the anti-imperialist freedom movement, the original Marxist scholars and the Communist Party placed a lot of importance and to an extent faith in the nationalist content of the Indian capitalist class, or at least a segment of it, politically led by Jawaharlal Nehru, to complete the transition from a pre-capitalist India to a

capitalist India. The withdrawal of the Telengana movement can be aptly attributed to their vociferous support to Soviet supported industrialisation and public sector, and to the belief that this will spur the national capitalist class to fight out feudalism and enlarge the home market, which can be used exclusively by the progressive national capitalist class. That context prompted the land reform legislation as an anti-feudal struggle releasing the productive forces in the society. Such a conception of reality, where the motion of the society is viewed as the motion of a national capitalist class, was challenged with a new formulation of the class character of the state by the Communist Party of India (Marxist-Leninist). Briefly stated, they characterised the Indian society as semi-feudal and semi-colonial and the state power as being held by feudal lords in alliance with the compradore and bureaucratic capital. The compradore and bureaucratic capital acts as an agent of the imperialist capital and does not develop its own technology and capital, and depend on various imperialist powers and as a consequence does not release the productive forces hidden inside the society under feudal grip. The landlords enjoy the economic and extra-economic surplus, through market forms and through social oppression using the age-old caste dimension and the large pool of agricultural labour, whose wages can be kept at reservation utility level. In an earlier paper,[21] I tried to present some implications of the Naxalite movement.

The implications of the Naxalite model of the Indian economy are that the changes in the economy are exogenous to the economy, determined largely by the extent of imperialist aid, both in quantum and composition. The repaying capacity of the aid is restricted by the non-development of Indian technology. The development of Indian technology is closely related to the lack of anti-feudal content in the ruling class. The model locates the problem of development as an anti-feudal movement of the society, and the agricultural labour and poor peasants as the classes that will set the society in motion, initially through a series of land reform measures.

During the last three years, the much talked about crisis in the Indian economy and society has drawn two types of responses. One response is the World Bank, IMF type of response which suggests a liberalisation and globalisation of the Indian economy as a solution. The intellectual foundations for that rest with the new institutional economics, which sees the state largely as an evil and a necessary evil. The second response to the crisis is the strengthening of anti-feudal movement. As far as the agricultural sector is concerned, they both rest their conclusions on the same reality—mass of agricultural labourer and poor peasantry, living at a reservation utility level and low opportunity to move out of agriculture. The free market model possibly expects to grow at such a speed that the mass of agricultural labourers will become part of the growth process. Since it takes time, the model permits a safety net, safety from what one does not know. On the other hand, the Naxalite movement, I presume, views a way out of the crisis only through an anti-feudal restructuring of the society, with or without violence, by the state and/or by the people.

Political Economics of World Capitalism

Ranjit Sau

Two recent events have caused a paradigm shift in political economics: (a) the unprecedented achievements of east Asia, and (b) the fall of the Soviet Union. The contemporary world displays two contradictory signs in three spheres—economic, political, and religious. Forces of liberalism and those of ultra-conservatism seem to be at work at the same time.

With elements from the contributions of Kosambi, Mahalanobis, and Myrdal on India, the author constructs a theory, and projects it on the global scene to illuminate the present complex reality. With the third industrial revolution beginning in the aftermath of the second world war, the international economic order has entered a new stage. The dynamics of this New Imperialism is captured here with 'the new growth theory' formulated in the 1980s.

Where did the 'dependency theory' go wrong? Is the theory of 'unequal exchange' false? What is driving India towards globalisation? These are some of the questions that are addressed.

TWO recent events have caused a paradigm shift in political economics: (a) the unprecedented economic achievements of east Asia including China and Japan, and (b) the fall of the Soviet Union. Furthermore, as one looks around the world today, two conflicting signs are visible in all the three spheres—economic, political, and religious. Waves of economic liberalisation in eastern Europe, Asia, Africa, and Latin America are being accompanied by measures of protectionism in the trading blocs of north America, western Europe, and south-east Asia, for instance. While democratic movements are sweeping Latin America, Africa, and eastern Europe, autocracy seems to be getting fortified in parts of west Asia, and the Commonwealth of independent states. In international forums every country is proclaiming faith in the universal dignity of the human being, the freedom and equality of the individual, and the rights of minorities. But at the same time we see that in some regions the phantom of religious fundamentalism is raising its ugly head. This paper addresses the bewildering complexity of modern times.

Kosambi has interpreted India's history in a certain way. Mahalanobis has articulated a distinct view about India's development. And Myrdal has used an institutional approach to explain the evolution of south Asia. The insights of these three eminent writers, in our judgment, are complementary; they can be blended into a comprehensive theory that touches all the three dimensions—economic, political, and religious. Section I is devoted to an exercise of such theory reconstruction.

Kosambi, Mahalanobis, and Myrdal (KMM) were concerned with India directly. However, their views, we believe, have a much wider connotation. After all, India is a miniature replica of the whole world. With all its diversity India can mimic the rich texture of the entire world, albeit at a smaller scale. Variegated landscape, uneven economic development, top-rate talents, unfathomable poverty, community of every religion—India has it all. From primitive caveman to modern finance-wizard, and all the rest in between coexist in this country. And the above-mentioned two apparently opposite trends prevailing in the world obtain very much within India as well. So we shall dare make an experiment by projecting the KMM theory (of our rendering) onto the global scene, and thereby illuminate the latter's tensions.

As the century draws to a close the world is reorganising itself on the ashes of the cold war. Since the 'second world' that consisted of communist countries has vanished from the screen, one might ask: can there be a third world at all? Apart from the obvious arithmetical anomaly, the demise of the third world had been declared some time ago on other ground. Rapid progress of Brazil, Mexico, South Korea, Taiwan, Hong Kong, Singapore, Malaysia, Thailand, and others has refuted the dependency theory that once predicted an inescapable trap of poverty and stagnation for third world countries [Fukuyama 1992, Harris 1986]. It is high time we reassess the structure of the emerging international economic order.

The production function, so often used in economics, is an abstract category that takes us from the space of inputs like coal, steel, labour, to that of outputs like car, rice, and butter. This transformation is done through the prevailing technology. The production function changes with the ages. It can make an excellent organising principle to understand the world system.

Since the days of mercantilism in Europe of the 15th, 16th, and 17th centuries till the present times there have been regimes of imperialism of several kinds. A historical formation, we know, could be best understood by studying its mode of production. By the same token it can be rigorously analysed with reference to its production function, in particular. We submit that the *differentia specifica* of any type of world system is its underlying production function. We shall characterise some of the existing theories of imperialism by this standard.

In the 1980s economic theory witnessed two major innovations, namely, a new growth theory with endogenous technological change, and a new trade theory with increasing returns. Should these theoretical models be accepted as depicting the current situation, then our traditional perception of the international economic order ought to be refocused. Section II elaborates this point.

We mark the beginning of a new stage of the world economy in the second half of this century when the third industrial revolution got under way. It contains contradictory forces that might widen the gulf between the rich and poor countries, and at the same time it may witness the rise of some economic superpowers. The 'new growth theory' can shed light on this epoch. The tensions of the new imperialism are reflected in economic, political, and religious domains. Section III deals with this theme.

I
A Kosambi-Mahalanobis-Myrdal Theory

Kosambi defines history as the presentation in chronological order of successive changes in the means and relations of production. This concept of history will inform our analysis here. We shall express the means and relations of production in the compact form of a production function.

"The more important question is not who was king, nor whether the given region had a king", Kosambi (1975:13) maintains, "but whether its people used a plough, light or heavy, at the time." Seen in this light, a peculiar zigzag process in India's history becomes transparent. A new stage of production manifests itself in formal change of some sort. If the defending mode of production is relatively backward, the change is often religious. The new form, if it does increase production, is acclaimed and becomes set. If the superstructure cannot be adjusted during growth, then there is conflict. Sometimes the old form is broken by a revolution in the guise of a reformation. Sometimes the class that gains by preserving the older form wins; in that event there is stagnation, degeneracy or atrophy. The early

maturity and peculiar helplessness of India's society against later foreign invasions bears testimony to this general schema.

India's development has been in its own way more 'civilised' than in other countries. The older cults and forms were not demolished by force but assimilated. Superstition reduced the need for violence. Much more brutality would have been necessary had India's history developed along the same lines as that of Europe or Americas [Kosambi 1970].

Myrdal begins by denying the abstract concept of man as an economic automation. His book is based on the firm conviction that economic problems cannot be studied in isolation but only in their demographic, social, and political setting. He adopted, in other words, an institutional approach. Myrdal came to the conclusion that an underdeveloped country cannot rely on a gradualist strategy. It needs a Big Push to break the stalemate that has possessed the entire social, political, and economic set-up.

"The South Asian village is thus like a complex molecule among whose parts extreme tensions have been built up", observes Myrdal [1968: 1063-64]. "Although the tensions crisscross in a manner that maintains equilibrium, it is conceivable that they might reorganise in a way that would explode the molecule." But he is not very sure of an endogenous catalyst. "This [explosion of the molecule] probably would not happen spontaneously", he said, "but as the result of a forceful onslaught from outside". In other words, a big push from outside is needed.

However, Myrdal does not spell out the content of the big push; nor does he specify how and wherefrom it will come. At this point Mahalanobis provides the missing link. "I agree with... Myrdal", he says, "that a 'big push' is necessary to move the society forward as a whole. But what is the mechanism of a big push? It has to begin, like a flame, or a chain reaction, and spread. It has to be like the spearhead of a movement." The answer to his question becomes self-evident from the following statement of Mahalanobis [1969: 1123]: "The scientific revolution, the social revolution, and the industrial revolution are three aspects of the process of modernisation in every society; these three aspects may be distinguished but cannot be separated". In short, it is the revolution in science and technology that would assume the role of a big push.

We shall now weave together these views of the three distinguished scholars into the following propositions: The economy is a complex of several modes of production and their derivatives. As new forms of production appear on the scene, the old order may not give way. The resistance of the latter may manifest in the religious sphere. In course of time the new gets assimilated with the ancient. As a result a crisscross of interests of various groups is formed. Sharp polarisation or well-demarcated political alignment becomes almost inconceivable. The resultant stalemate can be broken most probably only by an external force—a big push. That big push may come in the form of advances in science and technology.

While Kosambi, Mahalanobis, and Myrdal had India on their mind, we can extend to the whole world their joint theory of crisscross, stable low-level equilibrium, and big push. Indeed, the countries of the world are at uneven stages of economic development. Capitalism has not overpowered all other modes of production. There is a complex mosaic of interests of different groups, regions, and countries which may be taken as equivalents of clans, tribes, castes, and classes in this wider context. Evidently, revolution in science and technology has provided a big push to the world economy from time to time.

The first industrial revolution started in Britain during the 18th century. Innovations in the spinning and weaving of cotton greatly boosted productivity. It was followed by developments in iron smelting and the steam engine. Industrialisation centred on steel, railways and steamship.

The second industrial revolution (1870-1913) saw technological advances becoming more dependent on scientific research that was systematically organised in firms and universities for commercial application. It was spurred by innovations in steel, electricity, refrigeration, organic chemicals, internal combustion engine, transatlantic telegraph, and radio. Germany, Japan, Russia, and the United States joined the industrial league during this period.

After an interregnum (1913-1950) when the global market had collapsed, the third industrial revolution has been under way since the 1950s. The post-war industrial growth in manufacturing has been fueled by an explosion of new technologies that have brought new products like synthetic materials, petrochemicals, nuclear energy, jet aircraft, computers, and electronics. Great strides have been made in telecommunications, microelectronics, and robotics. Thus, we see, through all the industrial revolutions it is science and technology that has worked as the big push in the Mahalanobis-Myrdal sense.

To be sure, here we are articulating a methodology that combines the contributions of several authors into one structure. The rationale for this synthesis is not difficult to appreciate. A theory, we know, aims at revealing the essence of a subject. Now, there are two concepts of essence—one is Aristotle's, and the other is Hegel's. Lenin, for instance, follows Hegel. By the essence of a thing Aristotle means "the set of fundamental attributes which are the *necessary and sufficient conditions* for any concrete thing of that type" [Cohen and Nagel 1968: 235; emphasis added]. But Hegel interprets it as "one of the essentials, one of the principal, if not the principal, characteristics, or features" of the subject. Furthermore, the essence is one thing, and the manifestation thereof is another. The same essence, be it Aristotelian or Hegelian, can express itself in various ways [Sau 1973].

Now, often it so happens that one author emphasises only some, not all, of the essential features of a particular subject. So the theses of several authors may be complementary. The thing to be noted here is the multiplicity of essential features of a subject, and the partialness of any one theory or narration. Under such circumstances it is legitimate to combine the views of several scholars to forge a more comprehensive theory. Elsewhere [Sau 1994] we first experimented with this approach by bringing together Kosambi, Mitra (1967, 1977), and Myrdal to theorise the contemporary Indian situation. Here we are going to apply the same methodology. The Kosambi-Mahalanobis-Myrdal theory, formulated above, will be applied to illuminate the global scene.

II
Of Diamonds and Ploughs

The mercantilists rationalised imperialism as a means of enlarging the stock of national wealth. They had a very peculiar notion of wealth, from which followed a belligerent state policy towards other nations.

Wealth in the mercantilist doctrine consisted of precious metals and stones like gold, silver, and diamond. Obviously, the total stock of precious metals and stones is more or less fixed for the world as a whole over a given stretch of time. So the wealth of one country could increase only at the expense of some other country. It was a strictly zero-sum game. Hence the close connection between mercantilism and the aggressive policies of the national states in those days [Pasinetti 1977:2].

To introduce the method of exposition that we shall adopt here, the above argument can be put as follows. We know

(1) $W = R$

where W is national wealth, and R is the stock of precious metals and stones in a given country. We shall look upon (1) as a particular production function. The country tries to increase W. That means it has to procure more R. So it pushes its exports, and/or wages war to loot precious metals and stones from neighbours.

Our methodology is as follows. We assert that every theory of world economy has an underlying production function. Accordingly, we shall examine some of the existing theories of imperialism and ascertain the corresponding production functions. Then,

as we approach the contemporary era, we shall reverse the order of investigation. To begin with, we already have some ideas about the characteristics of the currently prevailing production function. From there we shall proceed to infer about the structure of world capitalism as of the present moment. At the end of the road we hope to find what we call the New Imperialism.

Let us consider six theories on the international economic order, namely (a) mercantilist, (b) classical, (c) Leninist, (d) Keynesian, (e) neo-Marxist, and (f) neoclassical. The first one has been briefly narrated above.

Now we take up the second. The production function implied in the classical model of world capitalism can be written as under:

(2) $Y = f(L, N)$

where Y is national output, L labour, and N land. For simplicity land is assumed to be homogeneous; so is labour. Function f is continuous and twice differentiable. The first derivatives are positive, and the second derivatives negative. So the law of diminishing returns holds.

The supply of land in the country is fixed, but plenty of labour is available at a subsistence wage rate. This is a model of circulating capital. Wages advanced by the capitalist farmer to workers is reckoned as capital. As soon as the entire land is brought under cultivation, the law of diminishing returns asserts itself; and the 'stationary state' as visualised by the classical economists looms large. There will be attempts to escape the impending stagnation; and one of the ways for that would be to seek overseas colonies with abundant land. The colonies also will benefit from this expedition of imperial capital [Brown 1974: 38-39, Hicks 1969: 150-51].

Third, the Leninist model of imperialism emphasises, *inter alia*, the export of capital, and the seizure of foreign sources of raw materials. The former is prompted by the falling tendency of the profit rate at home, not due to diminishing returns, but due to the Marxian limit on the home market where workers receive only bare subsistence wages. And the latter is necessitated as raw materials are inputs for production; and the domestic supply is limited. The implicit production function in Lenin's model can be written as

(3) $Y = g(K, L, M)$

where K is fixed capital and M is raw materials.

Fourth, the emphasis of the Keynesian world economics is on the deficiency of demand. Production in the advanced industrial country obeys the following law:

(4) $Y = h(u K)$

where u is the degree of capacity utilisation. Obviously, u remains in the closed interval between 0 and 1. Since the aggregate demand at home is not high enough to make full use of the accumulated capital stock, the country would explore the possibility of export. When several countries do so, they may take up arms to carve empires.

Now we come to the neo-Marxist theory. Marx visualised a constructive outcome of colonial expansion. There are indications that Lenin shared that idea. Neo-Marxists questioned the notion of progressive capitalism first in September 1928, at the Sixth Congress of the Communist International when Kuusinen introduced "theses on the revolutionary movement in colonial and semi-colonial countries".

A major part of Marx's argument and much of Lenin's tone, if not his analysis, were incorporated into the doctrine that capitalism, rather than developing all areas it touches, can positively underdevelop them. This proposition was taken up by Paul Baran and Gunder Frank to explain the underdevelopment of some countries as a corollary, as the obverse, or even the cause, in fact, of the development of others. Thus was born the neo-Marxist theory of imperialism.

There is a hierarchy of exploitation, it says, or a chain of worldwide metropolis-satellite relationship moving from the headquarters of capital down to the landless labourers at the bottom. Surplus is extracted upwards and inwards. So one part of the world develops, and the other part necessarily underdevelops. Unequal exchange in international trade is one of the means of appropriating surplus [Brown 1974: 71].

The production function envisaged by the neo-Marxists can be expressed as follows:

(5) $Y = i(K)$

The centre of world capitalism develops as it procures the surplus-product and invests, while the periphery suffers as it has little capital to begin with, and gets much less to accumulate.

Fourth, the neoclassical picture of world capitalism is apparently polar opposite of the neo-Marxian one. There are, in fact, two branches of neoclassical growth story. One claims that the equilibrium growth rate of a national economy has a particular constant value which is determined by its own rates of saving, population growth, and exogenous technical change. The economy smoothly converges to the equilibrium over time [Mankiw et al 1992; Solow 1956].

The other branch of neoclassical economics is distinguished by its theorem of a rising equilibrium growth rate sustained by externalities and increasing returns [Lucas 1988, 1993; Romer 1986, 1990a,b]. Both are, however, unanimous about one thing, namely, the vital importance of human capital acquired through education, health, and experience on the job. They may be called, respectively, convergence and divergence branches of the neoclassical family.

The former posits a traditional neoclassical production function with exogenous technological progress indexed by parameter A in the following equation:

(6) $Y = F(A, K, L)$

For empirical test it is specified as

(7) $Y = K^{\alpha}(AL)^{\beta}, \qquad \alpha + \beta = 1$

It is assumed that A and L grow exogenously at rates g and n respectively. Steady-state equilibrium of the economy yields

(8) $\ln(Y/L) = b + gt + (\alpha / \beta)[\ln(s) - \ln(n+g+\delta)]$

where s is the propensity to save, t time, δ the rate of depreciation of capital, and b is a constant. This equation has been the medium for testing empirical validity of the theory.

With the data of 98 countries during 1960-1985, Mankiw et al (1992) have found that the regression of (8) is statistically significant, and the coefficients have the right signs. But the estimated rate of return on capital, implied in (8), appears to be too high. So, at the next step, another explanatory variable, namely, human capital is included. This variable is proxied by the percentage of the working-age population that is in secondary school. With this extension of the textbook Solow model, everything seems to be in order, and the theory is confirmed.

To examine the validity of this theory for India we have regressed (8) with time-series data of the 42-year period from 1950-51 to 1991-92. The government of India, *Economic Survey, 1992-93*, is our source. Estimates with the entire sample were marred by serial correlation; even the use of first-difference of variables did not help. So we tried several sub-periods. For sub-period 1977-78/1989-90 of India we find

(9) $\ln(Y/L) = 6.64 + 0.02t + 0.15[\ln(s) - \ln(n+0.05)]$
$\qquad\qquad (7.81) \quad (1.30)$

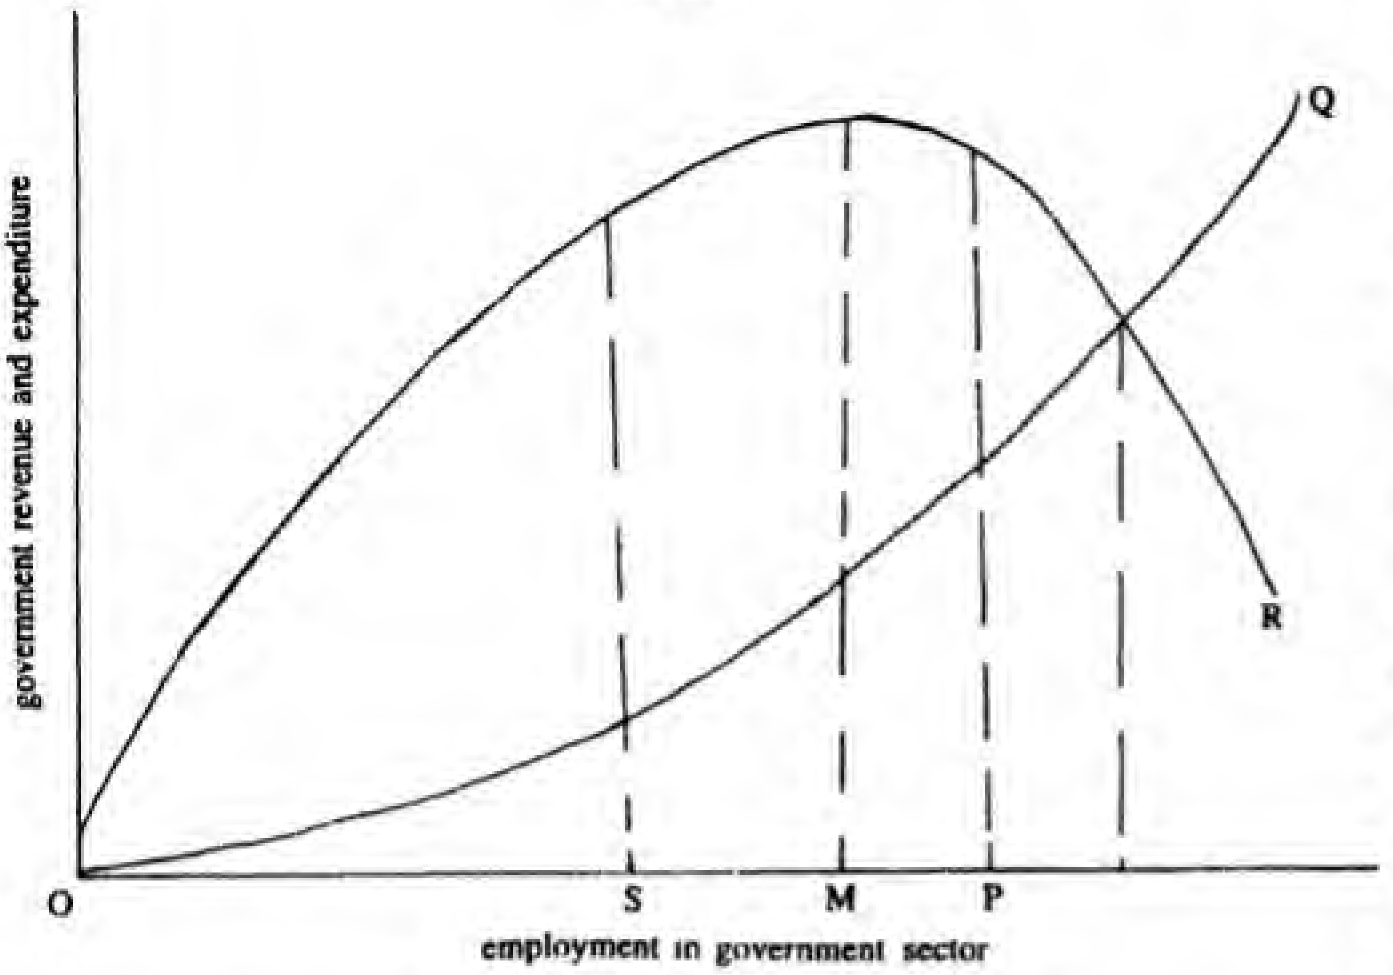
s e e = 0.03, $\bar{R}^2 = 0.89$, F = 51.72, DW = 1.11

where the figures in parentheses are t-values. Following Mankiw et al (1992), we have arbitrarily put $(g + \delta) = 0.05$ in estimating (9).

Parameter α in (7) measures the share of capital in total product. From (7), (8), and (9) it follows that $\alpha = 0.13$, which is rather small by international standards. If the capital-output ratio in India is taken to be 4, then the marginal product of capital would be $0.13/4 = 0.03$. Thus the real rate of return on capital at the margin is 3 per cent. If the rate of inflation is 7 per cent, then the nominal marginal return on capital in India works out at 10 per cent, which may not be very much off the mark.

What is most intriguing about (9) is that the exogenous rate of technical progress, that is, the coefficient of time t, is as high as 2 per cent a year. This rate is comparable with the corresponding figure for the US! Maybe, during that brief moment 1977-78/1989-90, India did record a fast rate of growth in total factor productivity. Nevertheless, it is hard to accept that (9)

FIGURE



captures the course of the Indian economy in long-run equilibrium. For, just at the end of the sample period India plunged into a severe economic crisis that was not merely cyclical, but so pervasive that it called for structural reforms.

Recall that in Myrdal's schema development can start only with an external force breaking through the low-level equilibrium trap. The convergence branch of neoclassical economics provides a stimulus in the shape of exogenous technological change. But then the question raised by Mahalanobis still remains: where does that technological progress come from? The other branch of neoclassical has an answer: technological dynamism can be made endogenous.

The third industrial revolution has ushered in an unprecedented system of production. Now a manufacturing firm assembles thousands of components into a final product, and many of those components are sourced around the world. Computer-aided design (CAD) and computer-aided manufacturing (CAM) allow tremendous flexibility in combining characteristics into products. This fact can be incorporated into the production function as follows:

(10) $Y = H^{\alpha} L^{\beta} \int_{0}^{\infty} x(i)^{1-\alpha-\beta}\, di$

where Y is final product, H skilled labour, L unskilled labour, and x(i) is component or capital good of type i. There is practically an infinite possibility of capital goods. An advantage of (10) is that some of the inputs x's may be zero.

Now, at a given date t, not all the capital goods have been invented. Only some of the potential capital goods are available, having been invented through research and development (R and D). Let the capital goods be indexed in such a way that good i has been invented if $i \leq A$, where A is a certain finite variable to be further described in a moment. Hence the upper limit of integration in (10) can be altered from infinity to a finite number A(t) at each date t.

Production function (10) itself remains as it is; what changes over time is the set of capital inputs that are invented and available. Consider a closed economy. Components x(i) are produced, according to the endogenous-growth theory, in an intermediate-goods sector. Further, and this is most interesting, there is a research sector that invents and supplies the designs to manufacturing firms to produce capital goods and a consumer good. The final good is homogeneous that can be used either for consumption or for production of capital goods of any kind. For simplicity, only one variety of consumer good is assumed. But the results are robust, that survive in the case of heterogeneous consumer goods also. As a normalisation device, assume that one unit of foregone consumer good can generate one unit of any capital good.

If K denotes the aggregate amount of capital goods in existence at any given time in the economy, we can write

(11) $K = \int_{0}^{A} x(i)di$

Since there is a very large variety of capital goods, we can assume that each is supplied by only one firm, and at an equal amount. Thus

(12) $x(1) = x(2) = \ldots = x$

It follows from (11) and (12) that

(13) $K = Ax$

In view of (10) and (13)

(14) $Y = (AH)^{\alpha} (AL)^{\beta} K^{1-\alpha-\beta}$

While (14) is a macro-economic production function, we suppose that a typical firm has an analogous production function. But there is a difference. At the micro-economic level, for any particular firm, A is a given parameter; but for the macro-economy A is a variable.

There is a research sector with the following production function:

(15) $dA/dt = aRA$

where A is the number of capital goods that have been invented so far, R is the volume of skilled labour employed in the research sector, and a is a constant. Unlike the Solow model, this economy will not stop at any steady-state, for the research sector would continue pouring out designs of new products.

For a firm equipped with a production that is a miniature replica of (14), there is only constant returns to scale, A being a given parameter. But A is not fixed for the macro-economy. The research sector is always inventing new goods, and thus changing the value of A over time as shown in (15). If (14) is homogeneous of degree one in H, L, and K, it displays increasing returns to scale in A, H, L, and K. This property of the macro-economic production function permits an ever increasing growth rate of the economy. Romer (1986) cites supportive evidence from century-old history of France, Germany, Denmark, Sweden, the UK, the US, Italy, Australia, Norway, and Canada. It is noticed that these are all advanced economies; none belongs to the third world.

What kind of international economic order does this model lead to? Analytically, we know the outcomes of two similar countries with production functions (14) and (15) engaged in trade. For some values of the parameters, it would be beneficial for them to have free trade. For some other values of the parameters, trade restriction can speed up world growth rate [Rivera-Batiz and Romer 1991]. We shall be interested in knowing also the consequences of two dissimilar countries interacting with each other. For future reference, let us rewrite (14) simply as

(16) $Y = F(A, H, L, K)$

where F is linear homogeneous in H, L, and K, but exhibits increasing returns to scale in A, H, L, and K.

III
The New Imperialism

In the preceding section our focus was on the advanced countries. The neoclassical models refer to full-fledged capitalism. For instance, the most ingenious contribution of Romer (1986) was to show that a well-defined competitive equilibrium exists even in an economy that has increasing returns to scale. Of course, it is subject to the provision that the scale economies are external to the firm. True, this equilibrium is not Pareto optimal. But what is remarkable about it is that the equilibrium

is the outcome of a well-behaved positive model and is capable of explaining historical growth in the absence of government intervention.

The agenda of Mahalanobis and Myrdal was different. They were concerned with the problem of how to start the engine of growth in the first place. Elsewhere [Sau 1988, 1994] we have analytically shown the existence of a criss-cross of class interests. Landlords, poor peasants, workers, ordinary capitalists, monopoly capitalists, foreign capitalists, and finance capitalists are all enmeshed in a cobweb of interrelationship. It is not feasible to separate them in neat groups to collude. To complete the picture, we ask: How is the government situated in this milieu?

Third world countries are notoriously diverse in area, population, income, political system, and cultural heritage. For analysis, it is often helpful to classify them. Findlay (1990) tried a two-by-two frame with democracy and dictatorship in one axis, and 'market oriented' versus 'centrally planned' on the other. Dissatisfied, he proposed a five-fold classification. For our purpose here we can say at a certain level of abstraction that a government plays a dual role—one predatory, and the other productive. In the former it extracts tributes from the subjects, mostly by taxation. In the latter it offers public goods such as defence, administration, justice, infrastructure, education, and health services. These can be construed as 'intermediate' inputs to the final products that are the concern of the private sector. Public expenditure acts as an 'externality' to private economic activities, enhancing private output from private inputs. This model has a faint resemblance with Romer [1986, 1990a, b]:

(17) $Y = G(L_1)\,F(L_2)$

where Y is national product, and L_1 and L_2 are employment in the government and the private sector. We know

(18) $G(0) = 1,\ G'(.) > 0,\ G''(.) < 0$
$F(0) = 0,\ F'(.) > 0,\ F''(.) < 0$

Total labour supply is given at L, and full employment is assumed:

(19) $L = L_1 + L_2$

Capitalists always maximise their profits. In a competitive market, therefore, the marginal product of labour in the private sector is equated to the given wage rate w:

(20) $w = G(.)\,F'(.)$

Recall that the government does not produce any final product. In this model, it employs labour to serve the private sector. There is a uniform tax rate θ on wage and profit incomes. The budget surplus S given by

(21) $S = \theta.Y - (1 - \theta)\,w.L_1$

In the right-hand side of (21), the first term is tax revenue, represented by curve OR in the figure. The second term is government expenditure or the after-tax wage bill of the government, represented by curve OQ in the figure. We shall consider four cases.

First, suppose there is a king. He maximises budget surplus for his own enjoyment. Maximisation of (21) with reference to L_1, subject to (17) - (20) with a given tax rate implies

(22) $G'(.)F(.) - G(.)F'(.) = (1-\theta)[G(.)F'(.) + L_1\{G'(.)F'(.) - G(.)F''(.)\}]/\theta$

At point S in the figure, this condition is satisfied, where the tangents to curves OQ and OR are parallel.

Referring to (18) we find that the right-hand side of (22) is positive. Hence in (22) the following holds:

(23) $G'(.)F(.) > G(.)F'(.)$

Second, consider an alternative, namely, maximisation of national income Y subject to (19). It requires

(24) $G'(.)F(.) = G(.)F'(.)$

This condition is satisfied when the tangent to curve OR in the figure is horizontal, as at point M. It can be shown that point M must be to the right of point S.

Third, suppose that the capitalists are united as a class, determined to maximise their total profit P, while the government remains passive. We know

(25) $P = Y - w.L_2$

Maximisation of P subject to (17) and (19) gives

(26) $w = G(.)F'(.) - G'(.)\,F(.)$. Hence

(27) $G(.)\,F'(.) > G'(.)\,F(.)$

Evidently, (27) occurs at a point like P in the figure, which is necessarily to the right of both points S and M. To be sure, (27) violates (23) as well as (24).

Fourth, as emphasised in the literature on bureaucracy [Niskanen 1971; Parkinson 1958], the government may be led to maximise public expenditure subject only to the revenue constraint. Such a position is depicted by point T in the Figure which is at the farthest right.

However, in a democracy the budget is usually thrashed out by ways other than the four cited above. There may be many posts in government that have nothing to do with providing public goods, but are vehicles to keep the lobbies in good humour. So the royal plunder that we have mentioned above may not always be manifested in budget surplus. There are hidden methods of siphoning off the cream. That is to say, the case of budget-surplus maximisation is not as outlandish as it may appear at first sight.

The morale of this fable is two-fold: First, the government does provide some essential inputs for private production. Second, as shown in the figure, there may be intense conflicts among the vested interests of bureaucracy, monopoly capitalists, and a parasite class that lives off government revenue. The first point can be formally registered in the production function by modifying (16) into

(28) $Y = E\,(G, A, H, L, K)$

Function E may be taken as linear homogeneous in G, H, L, and K, hence displaying increasing returns to scale in all the arguments taken together, G, A, H, L, and K.

In our view, (28) is most appropriate for third world countries, while (16) is so for the advanced economies. Function E of (28) is not linear homogeneous in H, L, and K, for G is an important input for production in the private sector of a third world country. If $G = 0$ in (28), the economy degenerates into the anarchy of the Hobbesian 'state of nature'.

Now we can think of G of (28) in much broader sense—it represents all public goods that are vital for production, but not forthcoming from the private sector. Recall that in the models of Rivera-Batiz [1991] and Romer [1986, 1990a, b] variable A is produced by private firms of R and D. Each manufacturing firm has monopoly power over its product; so it charges a monopoly price, and therefrom pays royalty for the product design supplied by the research sector. Our G is different from A, while both appear in (28).

Table: Degree of Unequal Exchange, 1990

Country	Degree	Country	Degree
First World		*Third World*	
Japan	+ 0.406	India	– 0.739
Germany	+ 0.149	China	– 0.835
England	+ 0.136	S Korea	– 0.232
France	+ 0.389	Mexico	– 0.539
Italy	+ 0.299	Brazil	– 0.424
The Netherlands	+ 0.284	Turkey	– 0.657
Canada	+ 0.095	Egypt	– 0.794

Note: The degree of unequal exchange is defined as $(e^*/e - 1)$, where e^* is the purchasing-power-parity (PPP) based exchange rate, and e is the market exchange rate of the currency of a country, *vis-a-vis* US dollar. The exchange rate is defined as the price of a unit of foreign money in term of domestic currency.
The negative sign indicates that the unequal exchange is adverse to the country, while the positive sign indicates that the unequal exchange is favourable to the country, all with reference to the US.

Source: Sau (1993).

Again, G as of (28) may be compared with B of Basu (1992: 6). Basu's B stands for a metaphysical entity called "belief". By contrast, G of (28) consists of such mundane things as roads, hospitals, schools, food-for-work projects, mini-kits of inputs for poor farmers, and irrigation canals. G in (28) is part of that external force, that big push, which moves the economy forward as envisaged by Mahalanobis and Myrdal. The basic problem here is that the production of G may be vitiated by the Prisoner's Dilemma [Boyce 1987]. It is conceivable, though, that once the economy, having been pushed by G, gathers enough steam of its own, the necessity of G diminishes, and eventually disappears. In short, the economy starts moving with (28); and after some time it is driven by (16).

What happens if the world is divided into two segments? One consists of advanced economies that have graduated to a stage where G is no longer vital for them. They work with (16). The other is a group of underdeveloped economies; for them (28) is relevant.

Reviewing the east Asian miracle, Lucas (1993: 270) concludes: "The main engine of growth is the accumulation of human capital—knowledge—and the main source of differences in living standards among nations is differences in human capital." He continues: "Physical capital accumulation plays an essential but *decidedly subsidiary role*" (*emphasis added*). This is a non-conventional paradigm. Human capital accumulation takes place in schools, in research organisations, and in the course of producing goods and engaging in trade. Little is known about the relative importance of these different modes of accumulation, but for understanding periods of very rapid growth in a single economy, like South Korea, learning on the job seems to be by far the most central. Doing the same job over and over again can impart a sort of skill and externality as in the 'learning by doing' model of Arrow (1962b), where also growth is endogenous [d'Autume and Michel 1993]. But for initiating and accelerating episodic growth, something else is required. "For such learning to occur on a sustained basis, it is necessary that workers and managers continue to take on tasks that are new to them, to continue to move up... the 'quality ladder'. For this to be done on a large scale, the economy must be a large scale exporter" [Lucas 1993]. Hence there is an internal propulsion for an advanced economy to invent, to produce, and to export new products.

There must be several reasons for the decline and fall of the Soviet Union. One of them can possibly be traced here as follows Soviet factories went on churning out the same products *ad infinitum*; there was virtually no R and D sector to invent new products for the market. In the absence of technological progress the growth that had occurred at an early stage was extensive, not intensive, and soon even that became unsustainable.

In stark contrast to the part of advanced countries, there is another part of the world economy that is underdeveloped. A country in the latter group relies on one or two crops. If there is at all any manufacturing industry, it goes on producing the same stuff. If the developed economies have a compelling thrust to export, the underdeveloped countries have an irresistible urge to import. Consumption dynamics of the affluent classes is said to be one of the factors to account for the unequalising, crisis-prone, and unstable growth that characterises so much of Latin America, for instance. The 'international demonstration effect' is not a recent creation, but has been a behavioural trait of Latin American affluent classes since the Conquest. During brief periods of export growth and ample foreign exchange the household demand of prospering classes shifted strongly from local artisan to imported consumer goods. And gradually the consumer preferences of the rich, more than the requisite purchasing power, have been filtering down to the middle class and further below [Felix 1983]. There is evidence that, dazed by city lights, rural migrants to the urban ghettos of Brazil trade their nutrition for fancy gadgets of cheap entertainment. Such international demonstration effect is being felt all over the third world.

Why is it that technological innovation is so rare in the third world? Why is it that despite obvious malnutrition, hunger and famine, there is so little change of technology in agriculture, for instance? Three views can be stated. One possible explanation can be along the lines of Arrow (1962b). Incentive to invent is less under monopolistic conditions than under perfect competition. Without the prospects of a relatively large gain, a monopolist will not undertake an invention because of his fear of losing the existing excess profit. By comparison, there is no such inhibition in the case of a competitive market. To induce a monopolist to innovate, the rewards must be larger than what would attract a competitive firm to do so. In an underdeveloped economy a landlord enjoys local monopoly power; so the Arrow theorem is applicable there.

Second, Bhaduri (1973) contends that a landlord has two channels of income, namely, rent from land, and usury on consumption loan to poor sharecroppers. A productivity-raising innovation would improve the first component of the landlord's income, but can reduce the second. On balance, he may be a net loser. Hence stagnation in agriculture.

Third, Boyce (1988) emphasises the essential contributions of public goods like water control. But provision of such goods suffers from the Prisoner's Dilemma. To take an example, suppose there are two farmers. Digging a canal will benefit both. Its benefits are nonexcludable; once in place, it helps both farmers. The project would cost Rs 400. For each farmer the gross benefit is Rs 300. So the project is justified on the whole. But no individual farmer will undertake it on his own, for his benefit Rs 300 falls short of the cost Rs 400. Furthermore, and this is most important, he has the temptation not to pay. Because he will get the advantage of the project anyway once it is completed.

Should they equally share the cost, each will have a net gain of Rs 100. But if the canal is dug by one farmer, and the other does not pay, the former loses Rs 100, while the latter makes a net gain of Rs 300. Under the circumstances, each farmer deciding in isolation, the project will not see the light of the day, for none will pay. It is not necessary that the cost is borne equally. Even if one pays Rs 299 and the other Rs 101, both stand to gain. In such a situation an institutional arrangement can solve the dilemma. Both may be brought together in a co-operative. Or the government may dig the canal and charge the farmers for services. Agriculture is replete with such instances; so are many other areas in the economy. The remarkable performance of agriculture in West Bengal during the 1980s is said to be attributable to such initiatives by the government. The new growth theory ignores this type of institutional hurdles that abound in any economy, particularly the underdeveloped ones. In (28), G represents this vital input of production.

Where did the 'dependency' theory go wrong? Is there no surplus appropriation from underdeveloped countries by the developed ones? Is the theory of 'unequal exchange' false? Elsewhere [Sau 1978: 55-58, 1993] we have rigorously proved the theory of unequal exchange, and demonstrated clearly that the currencies of underdeveloped countries, having been undervalued in the market, bear unmistakable brunts of unequal exchange (see the table). So, not that unequal exchange does not take place, but the fact of the matter is that a country like South Korea could turn the situation of unequal exchange to its advantage by increasing the volume of export, rather than avoiding it by withdrawing from international trade. What South Korea might have lost in unit price was more than retrieved in the quantity of transactions. After all, dumping is known

to be practised for immense advantage by many countries on a large scale and for prolonged periods. What east Asia shows is that the pace of development can even be stepped up, despite surplus extraction by foreign monopolists, if the generation of surplus is copious enough, making it a favourable positive-sum game. In case the dependency theory has been refuted by the spectacular growth in east Asia, it is so because this theory was preoccupied with only one variable, namely, K of (28), and overlooked the potential effectiveness of G and H.

Magdoff (1966:40) introduced the term 'new imperialism' to describe the world economic system since the Russian revolution of 1917. Now that the Soviet Union is no longer there, we have an occasion to rethink the matter. What sort of international economic order does the 'new growth theory' signify? Increasing returns, any textbook will say, leads to monopoly. The endogenous growth theory does contain an element of increasing returns. But it is of a different genre, that exists at the macro-economic level of a country but not for a firm. So it begets monopoly of a country in the assembly of nations. Obviously, only a handful of countries are enjoying the fruits of long-run high growth. The rest are way behind, though not entirely stagnating. The latter meet the common description of the third world well enough, irrespective of what has devoured the so-called 'second world'. If the Lucas-Romer models are any guide, the third world countries will be flooded with incessant streams of varieties of products from the developed countries. What the Lancashire cotton textiles did to the weavers of Bengal in the 19th century will continue to be repeated, only at a much greater scale all over the third world. And the affluent classes in Asia and Africa will not fall behind their counterparts of Latin America in fashioning their life-style in grandeur. There will be two somewhat opposite effects of this on the third world—a level effect, and a growth effect. The net outcome will be decided by the balance of the two.

The consequences can be seen first in the Solow model. The availability of ever new products may have an international demonstration effect, whereby the propensity to consume will rise, that is, the rate of saving (s) will fall. If so, by (8) the per capita income of the country in long-run equilibrium will decline. On the other hand, should the supply of modern inputs spur technological progress in industry, that is to say, g in (8) rises, the long-run growth rate of per capita income will improve.

The question can also be posed in the Lucas-Romer framework. Advanced countries have a strong research sector producing A of (16). The underdeveloped countries are driven by (28). Their A-sector is very weak; and they need a good deal of G. In the long run the fate of these poor countries would depend upon the performance of their A-sector which requires skilled manpower R. Meanwhile, as the multitude of new products flows from developed countries into the third world, modes of production in the latter will be threatened.

More than a century ago Marx and Engels (1872:112) referred to a similar process in history: "The bourgeoisie has through its exploitation of the world market given a cosmopolitan character to production and consumption in every country". Technology is at the root of it. "The bourgeoisie, by the rapid improvement of all instruments of production, by the immensely facilitated means of communication, draws all...nations into [the world market]. The cheap prices of its commodities are the heavy artillery with which it batters down all Chinese walls...In one word, it creates a world after its own image." What is missing from this description is the resistance put up by the modes of production that find themselves under attack. India is a prime example.

The latest episode of opening up the Indian economy began hesitatingly in the early 1980s with a loan of five billion dollars from the International Monetary Fund (IMF). The 'conditionalities' imposed by the IMF began to wear down the protective walls. The assault became more intense since mid-1991 when India adopted a structural adjustment programme under the supervision of the IMF and the World Bank. Of course, it would be a one-sided view unless we reckon with another aspect of the story.

Under various pretexts, a substantial amount of capital of India had already left the country, and is strategically parked abroad. Estimates of its magnitude vary between 100 and 160 billion dollars. This flight capital regards India as its preferred habitat. Under the circumstances it would shuttle back and forth between India and overseas. Furthermore, if a good chunk of India's capital is operating from abroad, a bright slice of India's society has located itself in foreign lands. The non-resident Indians (NRIs) are a successful, proud and sizeable group spread all over the six continents. Most of the top bureaucrats, business tycoons, and politicians of India have very close social relations with the NRIs. In a word, long ago India had been on the way to globalisation on its own; the conditionalities of the IMF and the World Bank came only to aggravate the trend that was already at work.

Here we refer to Kosambi's theory: if a relatively backward mode of production is confronted by a highly superior one, the classes associated with the former, in frustration, may carry the battle to the religious domain. India's history reveals that "vast religious upheavals...are generally indicative of powerful changes in the productive basis" [Kosambi 1975: 13]. The last days of the Shah of Iran, who ventured to mould his country in the image of western capitalism, may also bear some testimony to this general proposition. On the whole, interaction between two uneven sets of countries within the Lucas-Romer framework of endogenous growth would create a historically novel pattern of dominance and subordination. The sector of research and development (R and D) will hold the key to its dynamism. And the consumption pattern of the affluent classes in the third world will help perpetuate the links of bondage. In our reckoning this New Imperialism had begun with the third industrial revolution in the aftermath of the second world war.

To sum up, the two branches of neoclassical growth story portray somewhat different images of the contemporary world. The convergence theory of Solow, Mankiw and others conceives of a universe of autonomous national economies each moving to a steady-state determined by its own rates of saving, population growth, and human capital accumulation, regardless of others. The Lucas-Romer 'new growth theory', by contrast predicts a far more complex international economic order. It emphasises the vital role of scientific research and technology. Furthermore, it says, no country will settle down to a steady-state, as the research sector will continue to invent new products. It follows, we find, that the advanced countries will be compelled to search for export markets, and thereby will be led to rivalry among themselves. The theory admits alternative possibilities of free trade or protectionism, presumably in the shape of trading blocs. Since it contains increasing returns, the early birds will have an initial advantage; but the latecomers can possibly catch up and even overtake the leaders. Thus, if no country is preordained to remain always at the peak of the world economy, by the same token no country is condemned to the bottom of it for ever. Looking at (16) and (28) one feels reassured that the economic destiny of a country, in the ultimate analysis, rests at the hand of its people, regardless of the international economic order. If the Lucas-Romer theory can instil a measure of self-confidence into the present-day developing countries, that is not a small gain.

The prospects in the immediate future, however, are daunting for an underdeveloped economy. In the perspective of our reconstructed Kosambi-Mahalanobis-Myrdal theory, we see that the ongoing challenge to the present modes of production by a far superior external force will provoke defensive responses carried to the political and religious spheres. The transition, therefore, will not be smooth by any standard. But like India's history, this time it will be more 'civilised' than ever before!

[This paper gives the theoretical basis of my address at the Department of Political Science, Calcutta University, March 1994. Sobhan Datta Gupta invited me into this project. V N Reddy, helped me with econometrics. I am most grateful to them, without implicating them. The paper is part of a work which is partly financed by a grant from the Centre for Management and Development Studies, Indian Institute of Management, Calcutta. The views expressed here are the author's own responsibility.]

DCM SHRIRAM CONSOLIDATED LTD

Shri Mantosh Sondhi

Speech by Shri Mantosh Sondhi, Chairman at the Annual General Meeting of the Company held on July 18, 1994 at New Delhi

Ladies & Gentlemen,

On behalf of the Board of Directors and on my own behalf, I extend to you all a very warm and cordial welcome to the 5th Annual General Meeting of your Company. The notice convening the meeting, the Directors' Report and the Audited Accounts for the year ended March 31, 1994 have been with you for some time now and, with your permission, I shall take them as read.

The Economy

May I now say a few words about the economy. According to a recent report of the National Council for Applied Economic Research, this year (1994-95) should see "significant improvement" in economic growth, though the rate of inflation may rise. Obviously the rise in inflation, which is partly due to the large fiscal deficit, is a matter of great concern to everyone although the pronouncements made by the Finance Minister in the recent past that it should be possible to contain the inflationary pressures in the next 3 or 4 months is very reassuring. It is quite clear that in view of the large foreign exchange reserves, which have now reached at a very comfortable level of $ 16 billion even after the recent payment of $ 1.13 billion of principal to the IMF, comfortable foodgrain stocks which have never been at a higher level in the last four decades, strong upswing in exports and the expectation that the level of industrial production would lead to higher tax revenue collections, the Finance Minister has taken a "calculated risk" in keeping the fiscal deficit at a level of 6% of GDP in the budget for the current financial year. The present indications are that the budget deficit for the first quarter of this financial year is well below the estimated figure of Rs. 9,000 crores for this period.

With the monsoon already off to a good start for the seventh successive year and with a very positive uptrend in the corporate results announced so far this year, the present portents are that the "calculated risk" taken by the Finance Minister is likely to pay off. Changes in the depreciation rules and lowering of interest burden have no doubt helped to improve the profitability of the corporate sector, but one should not lose sight of the fact that more cost effective operations have also made a significant contribution to this. It is expected that there will be further improvement in the corporate results during 1994-95.

From the figures recently made available, it is found that the total revenue collections from customs and central excise duties in the first quarter of the current financial year have shown a satisfactory increase of about 13.51% over the collections made in the corresponding period of last year. If this trend is maintained, then it is likely that the budgetary targets set for revenue collections for 1994-95 will be achieved. Higher excise duty collection is also a reflection of greater industrial activity.

In my statement at the AGM last year, I had expressed the hope that the Government will take some legislative measures to stimulate economic growth and development. I had particularly made a reference to the Urban Land (Ceiling & Regulation) Act, 1976, which has really failed to achieve the objectives with which it was originally promulgated, viz. to bring down the urban land prices and to prevent speculation. I hope the Government will now have the political will to do away with this outdated Act in consonance with the statement made by the Finance Minister in his budget speech last year that a special review group will be constituted in each ministry to make a review of existing laws and procedures to identify changes needed in the light of the new policies.

Here I must also make a mention about the lack of infrastructure. Obviously, if the infrastructure continues to pose a threat and so long as this remains a serious bottleneck, it may not be possible to achieve our targeted growth in GDP. Rapid development of infrastructure along with the optimisation of its design and operation, therefore, requires immediate and very careful attention of both the Government and the Industry. This in fact is the key to the success of our efforts for economic development.

It is a matter of great satisfaction that with the Government's recent policy initiatives, the Indian energy scene is attracting world wide attention. In the power sector, out of a large number of proposals, which are under consideration, it is understood that a few of these are now nearing their "financial closing", this will usher a new era in power financing. This is necessary to meet India's seemingly insatiable appetite for energy.

Review of Operations

During the year ended March 31, 1994, sales of your Company at Rs. 502.09 crores were higher by 15.5% compared to sales of Rs. 434.71 crores in the previous year. The gross profit rose by 20.25% to Rs. 26.66 crores from Rs. 22.17 crores in 1992-93. The net profit at Rs. 15.15 crores was almost double as compared to Rs. 7.74 crores in 1992-93. All the units performed well and contributed towards this excellent performance. To share with you the fruits of better results, your Board of Directors have recommended a higher dividend of 30 percent on enlarged equity share capital due to

SHRIRAM UREA • SHRIRAM CEMENT

conversion of 15% secured redeemable partly convertible debentures of Rs. 140 each, which would be entitled to dividend on a prorata basis.

A. Fertilisers

The operations of the Fertiliser Division during the year were excellent. Production reached best ever figure of over 4 lakh tons. Efforts are being made to further improve productivity, and action has been initiated to incorporate the latest technological innovations. Though Government has announced increase in the price of urea to the farmers by 20%, unfortunately the urea retention price has not so far been revised; it is supposed to be effective from the 1st April, 1991. Due to delay in the issue of such a notification, the outstanding payments have mounted to such an extent that the interest burden has become excessive and the cash flow has been seriously affected. It has a crippling effect on the growth and development of this industry. I am aware that the Government is seized of this matter and hopefully a solution will be found before long.

B. Plastics & Chemicals

In order to meet competition more effectively through value added PVC compounds, the Company has entered into a technical collaboration with M/s Zeon Kasei Co. Ltd of Japan which is progressing satisfactorily.

The operations of caustic soda and chlorine plants are getting readjusted to international norms with better energy efficiency.

C. Power

The performance of the captive power plant has been extremely satisfactory. The capacity utilisation is 107.7% as against an average of 63% for the country as a whole. The project to increase captive capacity to 75 MW is progressing as per plan, and is likely to be completed during the current financial year.

D. Cement

Your cement plant continues to do well. There seems to be a sudden spurt in cement demand both within the country and in the export market. The cement prices have also firmed up. This augurs well for the future of this industry, which has passed through recessionary phase in the last two or three years.

E. Textiles

As a result of the implementation of the turn around plan in the two Textile Mills, the operations of Textile Division during the year have shown substantial improvement.

Environment

Shriram Environment & Research Centre set up last year to carry out research and development work in the field of environment is making satisfactory progress.

Subsidiary Companies

DCM Shriram Credit And Investments Ltd. (DSCIL) and DCM Shriram Aqua Foods Ltd. (DSAFL) have become subsidiaries of your Company. While DSCIL is engaged in investment, finance and leasing operations, DSAFL is putting up an integrated aquaculture project, which includes a hatchery, grow-out farms and a state-of-the-art process house for black tiger prawns, which have a very big export potential. Both the Companies are progressing as per schedule.

New Business Development

Your Company is evaluating possibilities of diversification in various areas, particularly power and chemicals. With this object in mind, the Company has decided to set up a 150 tons per day capacity caustic-chlorine plant at Jhagadia in District Bharuch in Gujarat. A second-hand plant has been purchased at a very economical price from the United States of America. This plant was originally supplied by M/s Asahi Chemical Industry Co. of Japan, whose services have been engaged by the Company to refurbish and re-erect this plant in India. The total investment on this project is estimated at Rs. 160 crores. The work is progressing satisfactorily and the plant at its new site is expected to be operational by end of 1995.

Preferential Allotment to Companies/Persons of Management Group

The Company allotted NCDs with detachable warrants to Companies/Persons of Management Group, their Associates and Nominees. The detachable warrants will be converted into shares in such time and at such premium as may be agreed to by FIs.

Rights Offer

It is proposed to open the Rights Issue of FCDs and NCDs with detachable warrants towards end of August/early September 1994. Keeping in view the shareholders' observations at the EGMs held on 24.2.1994 and 27.4.1994, your Company has made arrangements for buy-back of the NCDs after allotment. I am sure you will give your whole – hearted support to this Issue and share in the prosperity of the Company.

As the intention was to keep a common date for the purpose of ascertaining eligibility for dividend and Rights Issue and as SEBI's approval was received only on 29.6.1994, the Company's Register of Members and the Share Transfer books for the above two purposes would now be closed from Thursday, the 11th August, 1994 to Saturday, the 20th August, 1994 (both days inclusive).

Industrial Relations

The Company continued to maintain harmonious and cordial relations with its workers in all its divisions, which enabled it to achieve higher performance levels on all fronts.

Human Resource Development

The progress of the Company during last four years is in a large measure due to the quality of our human resources. New challenges and additional responsibilities have been accepted by one and all with a great deal of enthusiasm and with a full sense of commitment. Your Company fully realises the need of human resource development and is actively working on providing training inputs to all its employees.

Prospects For the Current Year

In the first three months of the current financial year i.e. April to June, 1994, sales of your Company at Rs. 138.5 crores are higher by 17.1% compared to sales of Rs. 118.2 crores in the previous year. Hopefully, the year should end on a much better note both in terms of sales and profitability.

Acknowledgements

Ladies & Gentlemen, in conclusion, I must compliment the management team of your Company led by Shri Ajay S. Shriram, Vice Chairman and Managing Director and Shri S. Shriram, Joint Managing Director, under whose able leadership the Company is progressing year after year. The Directors wish to thank the Government authorities, financial institutions, bankers, business associates and shareholders for their co-operation and support extended to the Company. The Directors also place on record their deep appreciation for the contribution made by employees at all levels to improve the working of the Company.

Thank you.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting

Sustainability of Dependent Capitalism

Some Lessons from Canada

P Mohanan Pillai

The ongoing recession and the crisis dimensions that the Canadian economy has reached do not seem to constitute a transitory phase. The present crisis would appear to be the outcome of the cumulative impact of a gamut of structural maladies the economy has inherited on account of the particular development strategy it followed. A vicious circle of dependence has developed overtime which seems to be gathering pace among trade and investment dependence, the weak balance of payments, slow growth rate and declining manufacturing productivity in the Canadian economy.

This paper is an attempt to understand the nature and significance of the structural features and factors that have contributed to the ongoing crisis in Canada.

IN the literature on foreign investment Canada once used to be considered a 'miracle' country that prospered by the free flow of foreign capital and foreign technology. However, today the country is referred to with a sense of despair; the image of Canada today is that of an economy pauperised by the same forces which once generated the so-called miracle of prosperity.

The fact that Canada's economy has entered a phase of decline since mid-1970s and culminated in a situation of crisis dimensions, may be verified from published statistics. The national debt has shot up from 17 per cent in 1975 to 65 per cent of the GDP by 1991-92 (Table 1); and the federal deficit has hit the record level of $ 46 billion in 1994, which is around 8 per cent of Canada's gross domestic product (GDP). The increasing Federal deficit is accounted partly by the increasing debt servicing and transfer payments to the unemployed. The unemployment rate which was only around 7 per cent in the early 1980s has gone up to 11.5 per cent by 1992. The balance of payments deficit which stood at 0.42 per cent of GDP in 1979-80 rose to 5.11 per cent of GDP by 1992. We observe here a situation in which increasing fiscal deficit leads to widening current account payment balance, the economy thus being caught in a complex vicious circle. Increasing indebtedness has brought increasing pressure and expenditure on the social service network, which the state had built painstakingly over a long period. The result has been disastrous; the number of children living in poverty jumped to 30 per cent between 1989 and 1991, giving Canada the second highest child poverty rate in the developed world.[1] Further, the poverty rate among the families headed by single parents has risen from 55 per cent, which itself had been unconscionably high, to a staggering 62 per cent, in the past four years and the magnitude is still on the increase.[2]

The ongoing recession and the crisis dimensions the economy has reached do not seem to constitute a transitory phase as we shall endeavour to show presently. It is not our argument that the recession in Canada is without parallel; but the severity of this crisis is rather unique. Canada entered the most severe of the post-world war recessions in 1981-82 following the second oil crisis. The decline in the GNP recorded a negative gowth rate in 1982. However, it should be noted that unlike the present crisis, the recovery in the past was quick. Following the present crisis which began in the 90s, the economy continues to reel around a negative or low growth syndrome. The present crisis would appear to be the outcome of the cumulative impact of a gamut of structural maladies the economy has inherited on account of the particular development strategy it followed.

This paper is an attempt to understand the nature and significance of structural features and factors that have contributed to the ongoing economic crisis in Canada. The lessons emerging from an analysis of the Canadian strategy might have implications also for developing countries preparing to follow similar strategies as part of their structural adjustment and liberalisation process.

Genesis of Crisis

The economy of Canada is based largely on natural resources. Even today resource extraction constitutes 40 per cent of Canada's GDP. During the three post-second world war decades, Canada had registered a historically high annual rate of growth averaging 4.6 per cent. Canada prospered as a major resource supplier mainly to the US market exporting wheat, forest products, metals and minerals. If we include the natural resource-based manufactured goods even today over 50 per cent of Canada's exports is accounted for by natural resources. Further, exports show little structural diversification (Table 2). Further, export dependence on the US has increased the proportion exported to the US has increased to 70 per cent by 1992.

In the case of imports the proportion of both the machinery and capital equipment and consumer goods increased over time. In the case of manufactured goods, imports are technologically much more sophisticated and much less raw material intensive than exports.[3] Here lies, in a 'developed' country, a typical classical situation usually prevailing in developing economies of heavy dependence characterising imports of machinery and consumer goods and export of raw materials, or energy-intensive products. But, unlike many other developing countries which have succeeded in diversifying their export destinations and import contents, Canada demonstrates a situation of integration with a single economic power, the US, under a dominant-dependent pattern.

Canada had long remained a major source of supply of agricultural produce, depletable natural resources such as metals and minerals and also forest produce mainly timber. The era of Canadian prosperity began from the 1870s when its economy was hitched more firmly to the US economy consequent on the northward expansion of a few US corporations engaged in mining and manufacturing. The early manufacturing industries in Canada belonged to the extractive group.

Soon after the formation of Canadian Federation, the strategy of increasing industrial growth was thought to be achieved by foreign investment and technology transfer. With the formation of Canadian Federation, there was an all around attempt on the part of government to attract foreign investment. One of the major measures contemplated was the Patent Act.

The Canadian Patent Act of 1872, declared null and void any patent that was not used within two years of being registered in Canada. The effect of this legislation was to attract large number of American firms out to make profit and forestall imitation by Canadian competitors. The protective tariff introduced in 1879 followed by a system of subsidies, interest-free guaranteed loans, free

industrial sites, tax breaks and gifts, were other major measures used by both the federal and provincial governments to attract foreign investment to Canada. The Canadian market provided an easy outlet for the big American companies seeking avenues for international expansion due to the close similarity in consumption preferences and cultural patterns of the populations of the two regions. By 1930, 34 per cent of Canada's electricity and 74 per cent of its natural gas were produced by the American controlled corporations.[4] In the case of mining and smelting it was 38 per cent and manufacturing it was around 32 per cent. The available statistics indicated that foreign ownership was steadily on the increase till 1970 To illustrate, in 1970, 58 per cent of the assets of Canada's mining was carried out by American subsidiaries. The proportion has fallen since then to 40 per cent in 1980. The corresponding proportions for natural gas was 74 per cent and 64 per cent and for manufacturing, 58 per cent and 54 per cent respectively.[5]

The Canadian labour force was mainly trained in the resource extraction and primary processing activities Despite the heavy reliance on external capital for excavation and processing foreign control of Canadian business (except railways) was not great because much of it came in the form of debt securities rather than equity The situation changed after the outbreak of the first world war. The US replaced UK as the major supplier of external capital. Capital was imported liberally from abroad, mainly from the US. By 1970s, the world was already moving into a single global trading economy. The rise of Japan and the low wage Asian tigers provided serious competition to Canadian exports The resource market being highly cyclical, Canada witnessed a continuous decline in the prices of commodity exported.[6] However, the sudden rise in the prices of oil in the 1970s gave the country for a short period the semblance of a boom. But the price of oil collapsed in the mid-80s.

By then it became clear that the future of Canadian economy would be in an entirely different direction for, the resilience of the economy based on exports showed signs of exhaustion. The welfare network already in ful swing, in particular almost free health and education, could not be sustained without resorting to huge deficit. This does not mean that the deficit in the budget is fuelled by increasing social commitment rather it is the outcome of a process of draining of the resources from the economy conditioned by the nature of the growth strategy. This point will be elaborated later. Suffice it to observe that the strategy of increasing dependence on American economy imprisoned the Canadian economy in a mould that rendered it incapable of accelerating a process of self-reliant growth based on its strength and capabilities to catch up with the rest of the latecomers with whom it started industrialisation process, namely, Japan, Sweden and Italy.

The downturn has been largely due to nationalisation policies that Canada began to initiate with a view to avoiding the negative consequences of foreign control manifested in the form of huge deficit in the merchandise trade from 1951 to 1960.[7] By 1971, the foreign investment review agency was established followed in 1980 by the National Energy programme which monitored the extent of foreign ownership and control. A wave of nationalisation that ensued under the aegis of by both central and the provincial governments resulted to some extent in indigenisation of control of foreign enterprises.

However, Canada does not seem to have succeeded in bringing about significant change in its production structure and trade pattern. Even today, its production structure remains very narrow and heavily foreign capital-dominated. There are reasons to suspect that the downtrend would persist and the Canadian economy would not turn the corner even after its entry into the NAFTA; in fact, it is likely that the NAFTA membership would only accelerate Canada's movement along the road to decline. In this paper, we propose to examine this proposition in some detail.

The nationalisation policies which Canada initiated since 1970 were short-lived. Encouraged by the surplus in the merchandise balance, a complete reversal of policies was effected after 1981: investment by the foreign corporations began to be encouraged again. In 1985, an investment agency Canada was set up to encourage foreign investment and technology transfer. As a consequence, foreign ownership and control in the Canadian manufacturing industry, steadily increased (Table 3).

The net investment income outflow which stood at $ 16 billion in 1986 (14 per cent of exports) increased to $ 25 billion by 1992 (18 per cent of total exports).

Another interesting facet of foreign investment in Canada is its extreme countrywise concentration. Direct investment from US rose to $ 87 billion and accounted for 64 per cent of foreign direct investment

in Canada. Investment from European countries in Canada accounted to $ 32 billion at the end of 1992. This represented 23 per cent of the total foreign direct investment in Canada, half accounted by UK, Germany and the rest by France, Switzerland, the Netherlands and Sweden. Japan, Hong Kong and Pacific Rim countries accounted for 7 per cent of the total investment.

As is clear from the above description both trade and investment structure of Canadian economy demonstrates acute dependence on the US and this dependence has remained stable over a period of time.

Canadian Multinationals

Table 3 gives an idea of the extent of foreign control in the manufacturing sector. However, in the sectors such as mining and petroleum the majority control still lies with Canadian domestic enterprises and some of the Canadian corporations have responded to globalising trends in areas such as mining and refining, aluminium, distilling, telecommunication and shoes. In spite of the heavy weight of American multinationals domestically owned Canadian firms were active in certain sectors mainly for the reason that the technology in use in them was relatively simple. Encouraged by the development of Canada's financial system, several Canadian corporations entered into mergers and other methods of consolidation to form themselves into large business conglomerates and expanded their activities on a multinational basis. Still, the Canadian multinationals are commonly found mostly in industries with relatively simple technological content. Such a choice was naturally the resultant of the dependent status of Canada under the capitalist regime in which it was functioning. As Niosi has observed, Canadian capitalism has developed a complementary relationship with American (dominant) capitalism and this is very much evident in the different zones of influence.[8] Technological barriers were formidable in advanced sectors for Canadian firms to enter. In self-defence, so to say, the Canadian bourgeoisie has however, erected legal barriers to prevent consolidation and take-overs by foreign companies in certain sectors. This step in conjunction with the natural comparative advantage that Canada has, helped Canadian Corporations to entrench themselves in industries like aluminium, nickel, copper, zinc, lead, paper and distilled liquors. These companies, having remained stable oligopolies for long periods, accumulated resource and technological capabilities which enabled them to go beyond the frontiers of Canada.

Canadian firms' outward direct investment started to accelerate in the mid-1970s.[9] It averaged about $ 3.5 billion during 1981-85. Access to raw materials has made these MNCs develop strong backward vertical integration a classic example of the market advantages of the MNCs. Major MNCs like Alcam Aluminium and Norada, are cases in point. These MNCs have internalised the country-specific advantages in resources. The other areas in which Canadian MNCs thrive are insurance (e g. Charted Bank insurance companies), transportation and provision of public utilities.

It is thus clear that the Canadian industry overseas is enmeshed in low technology sectors, a trait of Canadian dependent capitalism. Multinationalisation has not yet succeeded in invigorating its domestic economy and enhancing its technology.

Obviously, the spin off effect of foreign investment by the Canadian multinationals on the Canadian economy appears weak compared to those of other developed countries mainly because of the non-manufacturing character of the Canadian overseas investment. Of the $ 94 billion Canadian direct investment abroad by 1991 one-quarter ($ 23 billion) was channelled into foreign financial sector, notably banking, compared to 22 per cent at the end of 1987, metallic minerals and metal products was the next largest sector accounting for 13 per cent of the total direct investment abroad. The remaining Canadian investment was widely distributed among sectors like real estate development, construction, communications, food beverages, tobacco, textiles, chemicals, construction and related transportation. It has been difficult for the Canadian multinationals to enter into advanced industrial sectors. In the case of already existing international investment in the minerals and metal-based sectors, the host countries have found it easy to master the industry's know-how and therefore, the initial advantages that enabled these corporations to become MNCs are progressively disappearing. Since they have very little to offer the host countries a better deal in terms of competitive technology and diversified investment, Canadian investment has often been forced into joint ventures with government enterprises or even private sector firms in host countries. This experience of obsolescing bargain is particularly evident in the mining and metal-based industries.[10] In a few instances, Canadian enterprises, in particular, in developing countries, have been subjected to wholesale take-over. An analysis of the geographical distribution of book value of long-term Canadian investment till 1986 underscores this point (Table 4). Surprisingly, Canadian investment is seen to have increased, among countries in the developed world, only in North America. In all other regions it declined rapidly. Further, the stock of Canadian foreign investment in developing countries in particular in metal and mineral industries, too has gone down. The stock of investment which constituted around 24 per cent in 1970 nose-dived to 12.2 per cent in 1986.

Technological Backwardness

To some extent the relative slackness in overseas investment in general and in decline in developing countries reflects the relative technological backwardness of Canada among developed countries. In other words, despite the operation of MNCs in Canada for a number of years, Canadian capital is not dynamic enough itself to make overseas investment efficient and competitive

The liberal approach to foreign capital and technology (implicit in dependent capitalism) which Canada was following does not seem to have helped her in assimilation of foreign technology; nor has it enabled her to develop her own technology. In the dependency regime, Canada had perforce to

follow a line of technology followership. In sum, the comparative advantage which Canada enjoyed in the development of natural resource-based industries has reduced her to the status of an importer or borrower of innovations developed elsewhere.

It is interesting in this context to observe that in the 1960s national productivity and per capita income grew faster in Canada than in the US. However, most of the productivity gains occurred in sectors other than manufacturing while there was some improvement in productivity following the Canada-US automotive agreement.[11] In the 1980s, Canadian manufacturing productivity had fallen to 75 per cent of the US levels. Productivity in the manufacturing declined again over four successive years by 0.2 per cent in 1988, 1 per cent in 1989, 4.5 per cent in 1990 and 3.3 per cent in 1991.[12] The above phenomenon is largely a reflection of the inability of the Canadian economy to efficiently adopt, assimilate and generate productivity improvements of the technology transferred. That the easy availability of foreign technology and the ability to pay back in terms of export must have led to heavy import of technology prevailing in the manufacturing sector. Even the medium size sector national economies such as Sweden, Switzerland or the Netherlands invest more than Canada in R and D. Canada invest 1.4 per cent of GDP on its R and D against a range 2.5 per cent to 3 per cent in large and medium size countries. Patents also provide an indicator of the origins of technology used. More than 90 per cent of those awarded every year in Canada are given to foreigners mainly American residents.[11]

The consequences of this policy may not reflect entirely on the cost of technology imported, though it is important. To illustrate, though the technology policy that Canada has pursued can be described as a follower strategy meaning thereby that subordinate and subcontracting dominated the technological scenario of the economy and therefore domestic technology frontier moved only very slowly. It has to be admitted however, that due to national compulsions (not necessarily nationalistic) there has been some state intervention in promoting energy intensive industries linked to natural resource base and the development of transportation and telecommunication technologies which was important for the preservation of national unity. The development of both these industries has been heavily funded by the federal government. Again, government enterprises under both provincial and federal governments, have used all possible means including the rate rebates, tax discounts and protection to protect energy intensive and telecommunication industries with cheap electricity Canada has attracted many in the world of non-ferrous metals, pulp and paper. Communication and energy have attracted around 30 per cent of the total R and D expenditure undertaken by the Canadian federal government.

Needless to say, a large number of industries have been attracted to Canada which *inter alia* included some of the largest world producers of non-ferrous metals, pulp and paper and petrochemicals. Such a situation has enabled Canada to become the major exporter of energy intensive and low value added products. These industries make intensive use of non-renewable resources and are highly polluting to the environment. This is one aspect of the problem. The second aspect is the highly cyclical nature of the resource markets as a result of which Canada has witnessed a continuous decline in non-oil commodity prices.[14] This has been due to the growing substitution for the basic metal products. The Canadian firms which were specialising in the metal products lost out their market. Added to this is the phenomenon of Canadian companies running out of the resources that can be economically exploited. Today high grade mineral deposits and quality timber have almost disappeared in Canada. Ironically enough, the low technology profile of these firms makes them incapable to pursue a vigorous technological upgradation and diversification process that will give them a better edge in the world market. Therefore, a situation has risen in which Canada finds it difficult to pay for its imports with its non-renewable inelastic resources. At present she possesses only two high technology industries in which she enjoys a marginal foreign trade surplus; the telecommunications equipment and the aircraft industries. However, with the exception of telecommunication equipment, high technology industries are dominated by foreign companies.

As can naturally be expected, an industrial structure dominated by foreign companies imposes a heavy burden on the economy in terms of outflow of resources. The cost incidence of investment and technology transfers by the foreign companies has already been showing up in the increasing cost incidence of technology transfer and investment. The trade in traditional resources is unlikely to spur growth in future as it once did. But the payment for imports continues to rise. The surplus in merchandise trade is not sufficient to offset the investment income outflows, the cumulative deficit of which

Net outflow	–655	–786	–824	-973	–1000	–1154	-992	-1227	–1377	–1503

totalled $ 81.86 billion by 1992. The net of inflows and outflows on technology account alone is revealing (Table 4). It is alright for a country like Canada to be a net importer of technology. What is disturbing is that the net outflows has been increasing overtime. As Table 4 indicates the increase between 1981 and 1989 had been to the extent of 110 per cent. It is also important to mention in the context that the foreign controlled firms represented a major share of total imports varying between 67 per cent and 71 per cent with US firms accounting for more than three-fourth of the foreign controlled share. By 1986 foreign controlled firms were four times as import intensive as were the domestically controlled, compared to three times in 1976 thus leading to intensification of balance of payment pressure.[15] As is well known, a deficit in the balance of payments put an ultimate constraint on the growth of the economy. A vicious circle has developed which seems to be developing given the weak balance of payments, slow growth rate and declining manufacturing industry in the Canadian economy.

The free trade agreement among the three countries the US, Canada and Mexico which has taken effect recently will create the largest free trade zone in the world. What will be the likely impact of the North American Free Trade Agreement (NAFTA) on the Canadian economy? Mexico has the low cost advantage and Canada and America are more or less on par in wage cost. However, in a barrier-free North America, the likely restructuring may witness the emergence of the following scenarios. A look at the present patterns of Canadian trade with the US and Mexico suggest that the industries thriving on low cost factors are likely to be shifted to Mexico. Such industries are textiles, metal, fabricating units, machinery, electrical products and autoparts. The painful adjustment burden will have to be borne by the low-skilled labourers in Canada. Regarding the high cost, in high skilled industries located in the US and Canada there is likely to be a restructuring shortly. Canada's ability to gain from the restructuring depends on the competitive advantage to offset the disadvantages of high cost economy. This depends on economy, and ability to capitalise on technological innovations. As has been already seen, it is this very factor that is very much missing in the Canadian context. The labour force trained in extraction and primary processing of raw materials woefully lacks the critical skills and industrial R and D base for attracting industries from the rest of the world. The earlier compulsions of jumping the tariff barriers will no longer add the attractiveness of Canada as a host country. In fact, as a part of rationalisation process, the US multinationals rather than replicating their plants

.n are likely to serve the Canadian market by running larger production runs in the US and thus achieving better scale economies. The implication is that even the existing locations are likely to be closed down accentuating further the unemployment problem. Ironically enough, many Canadian observers are pinning their hopes on the depreciation of the Canadian dollar *vis-a-vis* US dollar as a positive factor in the investment decisions favouring Canada.

What lessons do the Canadian experience hold for the rest of the world? A nation which till fairly recently was regarded as a colonial nation either dependent upon Britain or US, Canada could not follow relatively independent path of development and had to be content with mostly an imitative and defensive strategy. Unlike other late industrialisers it had abundant natural resources to start with and had privileged access to the US and UK technology. The task force on foreign investment observed as back as 1968 "the ease with which foreign capital could be imported via portfolio direct investment, skilled manpower via immigration technology and entrepreneurship via direct investment had expanded the size and complexity of the economic base and the opportunities to Canadians. It has at the same time diminished the pressures for Canada to develop the skills amongst the Canadians to their fullest extent"[16] It is only natural to ask why Canada followed this kind of defeatist strategy? The answer to this question very much depends on the relative weakness of the Canadian bourgeoisie whose essential trait is non-industrial and dependent. It means that the economy has no control over US choices and that national choices are increasingly getting subordinated to moves from outside. Unlike the rest of the developed world, the weak Canadian bourgeoisie failed to recognise its long-run interest and even if it did could not muster collective strength of its own to withstand the onslaught on the economy.

Towards An Explanation

We may have to probe a bit more about the nature, characteristics and evolution of Canadian capitalist class. Why is it that the Canadian bourgeoise did not constitute a coherent national force? The attempts to explain the roots of this peculiar phenomenon have thrown rich insights into the making of Canadian class formation. Such explanations centre around the determinants such as history, geography, centre-periphery trade relations, the particularities and contradictions of Canadian development.[17] To elucidate, the major studies on Canada's economic process have underlined a sharp cleavage between finance and industry.[18] We have in the previous sections referred to strong financial sector: and its expansion overseas. This fraction of Canadian bourgeoise did not encourage the development of an indigenous class of Canadian industrialists. "Insofar as they have associated themselves with manufacturing activity to any considerable extent, they have increasingly done so in alliance with American industrialists who have bought out indigenous Canadian firms or established branch plants in Canada with little autonomous technological or export capacity. Whereas the key to the success of other twentieth century capitalisms has been its merger into a unified and concentrated national bourgeoisie."[19]

The above observation underlines the divided structure of Canadian bourgeoisie, the powerful factions of indigenous financiers, weak indigeneous industrialists, a dominant foreign capital as Leo Panitch describes it, "unmatched anywhere in the capitalist world".[20] Though there may be several objections regarding the distinctions made between the commercial and industrial bourgeoisie, however, the failure of Canada to develop a national bourgeoisie to usher in a relatively self-reliant path which would foster a diversified indigenous industrialisation is well-explained in the above characterisation. It is natural in such a context to trade its exhaustible natural resources for short-run gains. The same divided structure may also explain the unintegrated regional economies that the Canada is today. Each region oriented by the nature of its specific resources expresses readily identifiable and corporate interests of its regional economy[21] without providing the material foundations of a centralised state. The economics and politics of subordinate class formation is an interesting area that need to be probed, in particular in the case of white colonies. Such an enquiry may provide useful lesson into the structuring of dependency relations. In short, the Canadian experience reveals that even the apparently developed countries such as Canada had to pay a heavy price for pursuing strategies of open door economic programmes. Clearly, the Canadian experience underlines the need for exercising restraint and caution in blindly swimming with the tide.

Notes

Crises, Crashes and Speculation

Hegemonic Cycles of Capitalist World-Economy and International Financial System

Krishnendu Ray

This article sketches historically the capitalist world-economy from the 17th century to the present as seen from the vantage point of international finance during periods of hegemonic transitions. The discussion here is at a level removed from the everyday practices of production and consumption and from much of what is called 'market economy'. It focuses on the view from the successive cores of the capitalist world-economy such as Amsterdam in the 17th century, Great Britain in the 19th century and the United States in the 20th century. It gives attention to those events and processes that had systemic ramifications, largely ignoring those of regional or local significance. The attempt here is to describe the transitions at the apex of a world-economy consisting of several different regional hierarchies of finance both public and private, from Amsterdam to London, then, from London to a more global system led by New York, and finally to a tripolar world led by Tokyo.

I
Introduction

THE capitalist world economy is fragmented into politically discrete jurisdictions: states. Competition for capital between states is necessary for the system to reproduce itself but so is the need for order. It is scholars like Leopold von Ranke, Otto Hintze, and Max Weber who first drew attention to the relationship between capitalism and the modern interstate system. Max Weber added the interstate system to his list of necessary structural conditions for the emergence and reproduction of modern capitalism. Weber wrote in his *General Economic History*:

> This competitive struggle [between states in early modern Europe] created the largest opportunities for modern western capitalism. The separate states had to compete for mobile capital which dictated to them the conditions under which it would assist them to power. Out of this alliance of the state with capital, dictated by necessity, arose the national citizen class, the bourgeoisie in the modern sense of the word. Hence it is the closed national state which afforded to capitalism its chance for development—and as long as the national state does not give place to a world empire capitalism also will endure [Weber 1927/1981:337].

In *Economy and Society* Weber elaborated:

> Finally, at the beginning of modern history, the various countries engaged in the struggle for power needed ever more capital for political reasons and because of the expanding money economy. This resulted in that memorable alliance between the rising states and the sought-after and privileged capitalist powers that was a major factor in creating modern capitalism and fully justifies the designation "mercantilist" for the policies of that epoch... At any rate, from that time dates that European competitive struggle between large, approximately equal and purely political structures which has had such a global impact. It is well known that this political competition has remained one of the most important motives of the capitalist protectionism that emerged then and today continues in different forms. Neither the trade nor the monetary policies of the modern states—those policies most closely linked to the central interests of the present economic system—can be understood without this peculiar political competition and 'equilibrium' among the European states during the last five hundred years—a phenomenon which Ranke recognised in his first work as the world-historical distinctiveness of this era [Weber 1922/1978:353-54].

'Hegemony' is the process through which that 'equilibrium' is established. In adopting Gramsci's concept of hegemony for the interstate system we are referring to the power of a state to exercise governmental functions over a system of states. Hegemony is the additional power that accrues to the dominant state by virtue of its capacity to pose on a universal plane all the issues around which conflict rages [Arrighi 1990b:366-67; Modelski 1987]. Hegemons establish hegemonic regimes with support of those that are hegemonised (such as western Europe under American hegemony) and by excluding those that cannot be hegemonised (such as the USSR). Nonetheless, here we are mainly interested not in hegemonic regimes but in the transition between them so as to illuminate the present transition from US hegemony.

This is a historical sketch of the capitalist world-economy from the 17th century to the present as seen from the vantage point of international finance during periods of hegemonic transitions. Let us clarify what we do not intend to do in this paper: one, our discussion here is a level removed from the everyday practices of production and consumption and from much of what Braudel characterises as the 'market economy' (1977); two, it is focused exclusively on the view from the successive cores of the capitalist world-economy such as Amsterdam in the 17th century, Great Britain in the 19th century and the US in the 20th century,[1] and three, it gives attention only to those events and processes that had systemic ramifications, largely ignoring those of regional or local significance. Our attempt here is to describe the transitions at the apex of a world-economy, consisting of several different regional hierarchies of finance both public and private, from Amsterdam to London, then, from London to a more global system led by New York, and finally to a tripolar world led by Tokyo.[2] In Section II we briefly describe the distinctive aspects of the international financial network under the Dutch and then the transition to the British-centred world-economy which roughly covers the period from circa 1650 to 1795. Similarly, in Section III we first describe the British system and then the next expansion, retrenchment and reorganisation of the international financial system and the resultant instabilities due to British decline and the inability and/or unwillingness of New York to take the lead. This transition, like the previous one, was characterised by a long-lasting crisis that effected the banking system, and the currency, loan and stock markets and lasted from ca 1890 to 1945. The financial system bottomed out in a series of crisis in the interwar years. Consequently, it was only under the leadership of the American state that the international financial system was stabilised. Keeping with our focus on transitions, in Section IV we briefly describe the Bretton Woods system, moving quickly to a description of the present transition with all its associated symptoms of a debt crisis, an emergent banking and currency crisis and a volatile stock market. Here we also compare the present transition with the transition from Dutch to British and British to American hegemony, drawing analogies and pointing out differences. In this section we also attempt to outline the secular trends in

international finance in terms of, for instance, an expanding system, deepening institutionalisation and changing directionality of long-term financial flows.

Let us first provide a thumbnail sketch of the main features of the transitions under discussion. In the 17th century, Amsterdam plutocrats could establish control over the financial flows of the capitalist world-economy because of their monopoly over Baltic supplies and fine Asian spices through which they appropriated the bulk of precious metal coming into Europe from Iberian America. Sitting on monetary flows of such magnitude Amsterdam merchant-bankers established the *wisselbank* to manage it. From the middle of the 18th century, with downward pressure on profit rates in the main circuits of their commerce, Dutch businessmen withdrew into finance and chose to become the bankers of the world [Braudel 1984:243,246]. "Surplus capital", mobilised through the stock exchange from various trade monopolies, was then lent to European states involved in the most extensive interstate conflict between 1652 and the American War of Independence to make further profit. At the same time, because of a combination of processes that had been in the making over a long time, London was fast overtaking Amsterdam as the centre of a more complex array of financial institutions. Expanding transatlantic trade that English merchants and shippers controlled, declining profits in traditional Dutch strongholds like the Baltic trade that diverted the flow of Dutch capital to British enterprise, and the flow of tribute from India with which the British bought back their national debt from the Dutch, were the most important processes at the root of the shift of the financial centre from Amsterdam to London. The United Provinces had by the middle of the 18th century become a protectorate of the British state. Real competition for world power was between France and Great Britain that was decisively settled in favour of the latter with the Treaty of Paris in 1763 when the French were ousted from North America and India.

Although the locus of world liquidity began to shift from Amsterdam to London between 1690s and the 1720s, the breakdown of the financial pattern dominated by the Dutch did not occur until the 1770s. The new British regime was not established until after the restoration of the sterling-gold standard at par in 1821. The long destabilised international financial networks bottomed out in a series of crisis between 1763 and 1783. The financial instabilities of the 18th century were a product of the reconfiguration of trade networks and the insufficiently developed institutions of control for the new stock markets and bank money.

Monopolies in transatlantic trade circuits, especially in the slave trade, tribute from India, and the new international division of labour that made Great Britain "the workshop of the world" were the processes through which "surplus capital" came into Great Britain and was pumped out to the rest of the world through the via media of the city financiers such as the Rothschilds. Simultaneously, 'surplus capital' accumulating in different regions of the British national economy was mobilised by the branch-banking network and pumped out to the rest of the world once again through the medium of the city. British financiers, situated on such newly profitable flows of the 18th century, quickly moved to consolidate their advantage by setting up institutions of control. At the base of the British system of control was domestic credit-management and resource mobilisation through the national branch-banking network governed by the institutional nexus of the City-Treasury-Bank of England and at the apex was international credit- and currency-management through the sterling-gold standard. By the end of the 19th century when downward pressures increased on profit rates in trade and production English merchants replicated the Dutch preference for liquidity at about the same juncture in their hegemonic cycle and chose to become the financiers of the world investing much of their money in the North American railroads. This era has often been characterised as one of 'finance capital' and 'imperialism'. We will see how this 'stage' of finance capitalism is recurrent in the history of the capitalist world-economy.

Increasing competition that eroded the gold monopoly of the Bank of England at home and abroad and the resultant collapse of the sterling-gold standard in the early decades of the 20th century marked yet another phase of long-lasting financial instabilities in the capitalist world-economy that bottomed out in the inter-war years. Consequently, the financial centre of the capitalist world-economy shifted from London to Wall Street and the Federal Reserve system. Repeating another earlier pattern, the British, by the end of the 19th century, were no longer the main contenders for world power. The competition was now between Germany and the US and the issue was decisively settled in favour of the latter only in the course of the two world wars by 1945. The creation of a continental national economy through competitive industrialisation was the fundamental advantage that the American state had in the struggle for dominance which the German state—the other main contender for world power—could not replicate being hemmed-in in the middle of Europe.

Once again, though New York came to acquire increasing importance in the late-19th century financial network, the British regime did not collapse until the 1930s and the US regime was not put in place until the 1950s. General financial instability since the 1890s gave way to the terminal and transformative crisis of the 1930s: a period of systemic chaos. At the end of this period new arrangements of governance were instituted that included the US Federal Reserve System, Wall Street financiers, selected central banks, the International Monetary Fund (IMF), and the World Bank (WB). These were connected in a hierarchical relationship under what came to be known as the Bretton Woods system.

With the erosion of US industrial dominance by the 1960s, the Bretton Woods system was transformed into a genuinely multilateral system of control. Financiers based in east Asia, under Japanese leadership, became the biggest creditors and this new region became the powerhouse of the capitalist world-economy. Consequently, the international financial system witnessed increasing instability since the late-1960s and the pace of change seems to have hastened in the 1980s and 1990s. In the 1980s, we could recognise the rebirth of finance capital at an analogous juncture of the US hegemonic cycle. "[Every] capitalist development of this order seems, by reaching the stage of financial expansion, to have in some sense announced its maturity: it [is] a sign of autumn", argued Braudel, commenting on the cyclical rebirth of finance capital at the end of each regime of accumulation (1984:246). Instabilities in the international financial system has increased but it is an open question whether the 1980s and 1990s constitute a period of systemic chaos analogous to other such periods before, and whether we are witnessing the birth of a new hegemon. It is without doubt that today old regimes and institutions are being transformed out of recognition and the question is what would they look like at the end of these changes and could these transformed or newly formed institutions establish control over the emergent system without the trauma of a terminal crisis of the old regime and institutions? It remains to be seen whether it would be necessary to go through dramatic crises and wars, that have been necessary correlates of past hegemonic transitions, before any new regime is instituted. Have the rich and powerful learnt any lessons and do they have the institutional means to avoid repeating such catastrophic 'mistakes'?

Hegemonic transitions in the past have been associated with the pre-eminence of finance capital and long-lasting financial crises. Old patterns and regimes of trade and finance have been replaced and reconfigured and in the process new centres have replaced old ones as anchors of emergent systems of accumulation. Volatility and instability during transitions have increased the possibility of making quick speculative profits and have often even made it necessary to specu-

late as a method of hedging against risks in uncertain markets. Financial expansion and crises are two sides of the same coin. Hence, before we launch into any detailed description of hegemonic transitions we need to elaborate on the cyclical pre-eminence of finance capital and to define what we mean by a 'financial crisis'.

As regards the cyclical pre-eminence of finance capital, Braudel, taking issue with Hilferding's characterisation of late-19th century capitalism as a new stage of "finance capitalism" wrote: "Finance capitalism was no newborn child of the 1900s; I would even argue that in the past—in say Genoa or Amsterdam—following a wave of growth in commercial capitalism and the accumulation of capital on a scale beyond the normal channels for investment, finance capitalism was already in a position to take over and dominate, for a while at least, all the activities of the business world" (1984:604).[3] The tendency towards liquidity preference at the end of a phase of material expansion usually comes about by way of decisions by certain capitalist groups and organisations, especially those of the old centres who have lost their competitive edge or are ill-positioned or ill-disposed to fight the competitive struggles, to voluntarily pull out and restrain themselves from investing further while their profits are still high [cf Hicks, 1969:58-59, and *passim*]. Some may withdraw from production but still linger a little longer in the market for intangible assets, such as shares, so as to make a quick speculative profit. Many of the investors who withdraw in the ripeness of time may turn into speculators and be instrumental in leading the "bubbles" in the securities market. Here they need to delicately time yet another withdrawal from such intangible assets so as to leave the market when speculative profits are high, sometimes triggering the collapse of the bubble. Good speculators are the best capitalists and that is why so few capitalists can resist the temptation of playing the high risk market during tumultuous times. This withdrawal of capital in the ripeness of time or what Arrighi calls the "self-protection of capital" finds typical expression in rebirths in the financial sector (1990). Hence, crisis in the 'real' sector and affluence in the financial sector characterise the ends of cycles of accumulation [cf Sweezy and Magdoff 1988]. Consequently, the capitalist enterprises that pull out of trade and production in the ripeness of time have all the liquidity they need to take over at bargain prices the assets of the enterprises that miscalculated the conjuncture and got stuck with less profitable assets. This is the time for take-over battles and corporate buyouts. However, at this point finance capitalists may attempt to lead the mass of money capital out of trade and production altogether. Historically, leading states, that have a tendency to be in chronic financial difficulties because of their over-expansion (because states are driven by power-maximisation rather than profit-maximisation), have provided the most remunerative outlet for such capitalists [cf Hicks 1969:81,85]. Thus, at the end of each cycle Hobson's "finance capitalists" resurface to take charge of the process of capital accumulation under conditions of retrenchment in the "real" sectors [Arrighi 1990:17-23]. Older hegemonic states that are especially over-extended by this time in their hegemonic cycles absorb money capital to momentarily refurbish the dying regimes before that proves to be inadequate.

Hegemonic regimes in the past have usually overseen secular expansions of the capitalist world-economy, be it the 17th century articulation of the Atlantic economy to the Indian Ocean economy through the via media of the Dutch East India Company (VOC), or the 19th century globalisation of the capitalist world-system under British hegemony, or further industrialisation, commodification and proletarianisation in the 20th century under US hegemony. That is because newer regimes are nothing but improvements in the organisation of trade and production that in themselves become the expansionary forces [cf Hicks 1969: 56 and *passim*]. During expansionary phases profit rates increase and based on that expectations of future incomes increase, leading to expansion in credit and increased use of short-term debts to finance investments. Due to eventual overcrowding and falling rates of exploitation (as supply costs including labour-costs catch-up), profit rates begin to fall and as the cycle turns interest rates begin to increase under pressure of increasing demand at the old centres. In such an environment businesses find it difficult to sell their commodities as limits of current consumption structures are reached. Hence, it is simultaneously a crisis of overproduction, an underconsumption crisis, a crisis of the rate of exploi'ation, and most importantly for our purposes, a credit crisis marked by retrenchment.[4] Credit liquidation ensues and interest rates go up as the demand for cash escalates and many firms are faced with bankruptcy and/or are forced to sell assets and offload commodities at falling prices. The crisis proper is triggered by an event like a major bankruptcy and/or a decision by a major bill broker or central banker that credit is too extended and its resultant refusal to honour paper or tighten monetary policy. Financial crises happen more often than hegemonic transitions and since the Industrial Revolution have been associated with business cycle peaks. For instance, in the 19th century there was a credit crisis almost every 10 years (1816, 1826, 1837, 1847, 1857, 1866 and 1890).[5] Here, we are interested only in those long-lasting crises that seem to coincide with hegemonic transitions. A financial crisis in our sense occurs only when it effects the main centres of capital accumulation, is deeper than the recessions of the usual business cycle, and remains festering through a number of credit cycles because of problems of managing the 'usual crisis'. A hegemonic transition makes a quick recovery difficult because of incompletely formed institutions of governance of the emergent trade and financial regime and the absence of a lender-of-last-resort. The fundamental reason for the crisis to fester is that credit- and currency-management by the old financial centre is inadequate and new centres are unable to steady the system of accumulation. A crisis in our sense is defined by exchange rate volatility; run on major banking networks, a crash in the major stock markets, and an international debt crisis. All three hegemonic transitions under discussion have been characterised by crisis in one or more of these spheres. The transition from Dutch to British hegemony being the least clearly defined, in these terms.

II
Transition from Dutch to British Hegemony (ca 1651-1795)

The merchant-bankers of Amsterdam never managed to establish a hegemonic regime of international finance. Instead, they merely dominated the trade and financial flows of the 17th century European world-economy and established in Amsterdam the institutional funnels that furthered the city's role as *the* entrepot of the world-economy. Monopoly over the Baltic trade and displacement of the Portuguese as the pre-eminent European power in the Indian Ocean trade were the basis on which Amsterdam plutocrats established control over the bullion market, set up the stock exchange and financed their state-building activities. As a consequence they continued to profit from these institutions long after their decline as the pre-eminent centre of trade and industry. The Dutch 'enjoyed' a long decline, as Hicks put it (1969:60).

Amsterdam was the commercial and financial entrepot of the city-centred world-economy of the 17th century.[6] Precious metal came in from Iberian America to Amsterdam to settle Dutch surpluses with Spain and Portugal and was deposited by Amsterdam grain merchants and shippers in the *wisselbank*. This bullion played a crucial role in supplying the means of payment for the entire system.[7] It was not only Dutch deficits with the "external arena" that were paid from the bullion stock in Amsterdam but also English deficits. English East India Company (henceforth EIC) agents in

Amsterdam, for instance, purchased Dutch silver ducatons for the Asia trade, which, in the closing years of the 1690s amounted to no less than 7-8 million guilders a year [Wilson 1949:160; Attman 1983:54]. Then, the precious metal stock of the Amsterdam *wisselbank* played an important role in stabilising the Dutch currency, hence transforming it into an 'international currency' of some importance (though never a rival to the Spanish *rial*).[8] Arguing for the re-establishment of the *wisselbank* in 1802, the French Consul in Amsterdam explained the role of the Bank accurately

> Precious metals come to Europe from the New World, not in a constant stream, but at varying intervals, in the irregular bursts of a torrent rather than the smoother flow of a river. At the end of a maritime war which has kept the treasures of the mines pent up in the Spanish and Portuguese colonies, Europe is suddenly inundated with gold and silver in quantities far above what is needed, so that they would decline in value if they were put into circulation all at once. In such an eventuality, the people in Amsterdam deposited the metal in ingots in the Bank, where it was kept for them at a very low cost, and they took it out a little at a time to send to different countries as the increase in the rate warrants it. This money, then, which if allowed to flood in too rapidly would have driven up prices of everything exceedingly, to the great loss of all who live on fixed and limited incomes, was gradually distributed through many channels, giving life to industry and encouraging trade. The Bank of Amsterdam, then, did not act only according to the special interests of the traders of the city; but the whole of Europe is in its debt for the greater stability of prices, equilibrium of exchange and a more constant ratio between the two metals of which coin is made; and if the bank is not re-established, it could be said that the great system of the trade and political economy of the civilised world will be without an essential part of its machinery [cited in Vilar 1976:209]

Yet, Amsterdam was not only the major entrepot of precious metal and the site of the institution that controlled its flow (the *wisselbank*) but also the most important money market in Europe. The stock exchange was a product of the chartering of the VOC and it was *the* "blue chip" company that drove the Amsterdam market. Chaudhuri states that everyone agreed that the stocks of the two great East India Companies (the VOC and the EIC) acted as leaders in the Amsterdam and London exchanges. Daniel Defoe, for example, pointed out that though there were many different kinds of private shares in the market then, it was the East India stock that "was the main point" [Defoe 1719:13-14 cited in Chaudhuri 1978:417]. Through the bourse (the stock exchange), capital was recycled from profitable but stagnant or contracting trade networks such as the Baltic to expanding networks, and reshuffled among business and governmental units depending on their prospective solvency and profitability. The Amsterdam stock exchange, which in the early 17th century functioned as a powerful suction pump that drew 'surplus capital' from all over Europe into Dutch enterprise, a century later turned into an equally powerful machine that pumped Dutch 'surplus capital' into English enterprise [Arrighi 1990:50,77]. Other than recycling and reshuffling 'surplus capital', the Amsterdam stock exchange made possible the mobilisation of relatively small capitals at home on an unprecedented scale, and colonial expansion abroad.[9] Pierre Goubert accurately sees the role of the Amsterdam stock exchange in the 17th century as analogous to that of Wall Street in the 20th century [1970:23-54, from Wallerstein 1982: 111, n 123]. More on that later.

After the *wisselbank* and the stock exchange, the creation and management of the national debt was the third important element in the financial arrangement under Dutch dominance. As stated earlier, the VOC did mobilise a new mass of money capital, yet as far as the relatively small private investor was concerned the principal channel was government securities and it was only when these companies got involved in the consolidation of the national debt that a much larger pool of investors got interested in them. And before the birth of the modern welfare state the national debt basically involved defence costs. Dutch finance capitalists found an outlet for the 'surplus capital' accumulating in the hands of Amsterdam merchants in the needs of the state. If these large pecuniary surpluses were reinvested in the networks of their origin, for instance in the Baltic trade, the most likely outcome would have been an upward pressure on purchase prices of Baltic supplies and/or a downward pressure on sale prices—that is why we call it 'surplus' capital [Arrighi 1990:39-44].[10] Fortunately for the Dutch merchants involved, this surplus capital found an outlet in a number of avenues: (a) in investments in land; (b) in trade expansions to the Orient; and (c) most importantly, in loans to the Dutch and eventually the English state.[11]

Protection has always been a very expensive business. Fortunately for Dutch financiers Early-Modern Europe witnessed a particularly dramatic escalation in costs of wars and the provision of protection.[12] A state's capacity to provide protection depended in the first instance upon an adequate supply of men and munitions which in turn depended on sufficient money and proper organisation [McNeill 1984: vii, 117, 144ff].[13] A political-fiscal revolution was needed to pay for the costs of military-naval expansion on such a scale. It is in the realm of state financing through public debt that the Dutch proved to be the leaders. The capacity for an unprecedented expansion of the debt-revenue ratio funded by indirect taxes was the financial revolution,[14] and a political structure that handed the reins of the state to the same urban plutocrats who financed the public debt was the political revolution.[15] Together they defined the Dutch lead. Rasler and Thompson correctly generalise, that

> ... the earlier winners in the struggle for world leadership owed a significant proportion of their success to their ability to obtain credit inexpensively, to sustain relatively large debts, and generally to leverage the initially limited base of their wealth to meet their staggering military expenses. Conversely, the decat or demise of the earlier losers, despite the possession of relatively extensive resource bases, can be traced partly to their failure to generate or maintain a sufficiently competitive financial capability (1989:89).[16]

By shifting into finance from production and trade, Dutch capitalists had merely postponed the inevitable end of their dominance. The transition from Dutch domination of the international financial networks to British hegemony was a long affair compared to subsequent hegemonic transitions. That was perhaps because it took a certain degree of maturity of the capitalist world-economy before any genuine international regime could be instituted. It took a long time before the British could institute a financial system for the world-economy, whereas the Dutch had more or less merely dominated the current flows. That is also the main reason why this transition did not exhibit all the features of a 'financial crisis' as defined in the introductory section of this paper. As there were, for instance, no institutionalised exchange-rate systems in place, nor for that matter the extensive use of bank money, or 'third world nations' to be indebted, certain typical features of a crisis were missing. Equally importantly, the very nature of the available data (in the absence of national accounting methods) makes it impossible to fully describe the analogous crisis in the same conceptual terms.

Nonetheless, it can be argued that the most definitive features of this transition came in the 18th century, especially between 1690 and 1773. The challenge first took shape in the sphere of trade. The English did not directly boot out the Dutch from the position of dominance. Instead, they were the benefactors of a reconfiguration of trade, especially the Americanisation of the capitalist world-economy. The processes that led to the relocation of England at the centre of a new regime of trade was in the making over a long period of time. In a symbolic way the eviction of the Venetians and the Hanse, who had once controlled the

main English export of cloth, between 1533 and 1598 marked the beginning of a concerted attempt by English merchants to move from the periphery towards the centre of a new trading system. The Dutch still controlled European trade and were the first to challenge the Iberian powers in the New World and the Portuguese in the Far East.

For more than a century English and French forays were a distant second to the Dutch challenge but slowly the foundations for English pre-eminence were laid out [Minchinton 1969:3]. There were a number of factors in the eventual English victory on the Atlantic, many of which the English had done nothing to deserve. First, was the location of Great Britain as an island on the currents of Atlantic trade that provided her with locational advantages of protection and intermediation. Second, there was the long-term effect of Iberian-Dutch hostility on the Atlantic which ended up (a) by inadvertently protecting the English from Spanish naval might by anchoring a 'naval screen' when the Dutch seized Curacao in the Caribbean in 1634 [Wallerstein 1980:64]; and (b) by driving the Portuguese into 'buying' protection from the English at terms highly favourable to the latter, that half-a-century later was formalised in the Treaty of Methuen (1703), through which the English gained access to Brazilian supplies and Portuguese markets. Third, settler colonialism in North America, the other important factor in later English pre-eminence in the Atlantic trade, happened to be spearheaded by immigrants from England, Wales, Scotland and Ireland. The Dutch could never compete with the English in settling North America simply because fewer Dutchmen were available as a result of relative labour scarcity [Boxer 1965:109]. Moreover, higher standards of living made immigration across the Atlantic unattractive for most Dutch. Most of the colonial population, and nearly all the well-to-do merchant, planter and professional classes, were of British origin, who over generations became accustomed to take manufactures from British sources (so important for the Industrial Revolution) and sell through British factors (so important for the transformation of Great Britain into the new entrepot and the centre for services in the 18th century capitalist world-economy) [Davis 1969:115].

Then there were purposive mercantilist actions of wars and protection that the English state initiated so as to come to dominate the Atlantic trade. First came the protectionist measures and then through them the benefits from wars and peace treaties. Expansion of the English shipping industry, so crucial for protection of her island status and the establishment of a sea-borne empire, came in the 17th and 18th centuries as a combined result of strong state protection in the form of the Navigation Acts of 1650 and 1651, the Act of 1660, Act of Frauds of 1662 and the Staple Act of 1663; [17] the coastal coal trade; the Newfoundland and Greenland fisheries; and the expansion of the Mediterranean and African trades [Minchinton 1969: 11; Davis 1962]. The unequivocally mercantilist Navigation Acts sice 1651 directed much of the commodity flows into the British entrepot and excluded the powerful Dutch carrying trade, as a consequence, nurturing London's commercial and bank capitalists. The Navigation Acts were a major tool in locking-in the colonial market to the British national economy, especially the British North American market. This was of special significance given the ten-fold increase in the North American population between 1700 and 1775 and given the high wages current in those colonies that generated a large effective demand for English manufactured goods [Wallerstein 1989:68, n 53]. As trade expanded the tax-base expanded, further strengthening the state. In the English case it particularly benifited the state because trade was funneled through a few bottlenecks—the ports—where duties could be collected cheaply and efficiently. The opportunities for this depended on geography and that had much to do with the long-standing relative efficiency of English administration. If trade, on the other hand, passed over a vast and often ill-defined frontier then duties were more difficult to collect. Furthermore, if taxes on trade had to be taxes on internal trade, they have to be levied at artificial frontiers, which are difficult to police. Most states of Continental Europe, including France, faced this difficulty [Hicks 1969: 82]. Then there were a series of other protectionist measures, such as the Acts of 1700 and 1721 that prohibited the importation of printed calicoes and cottons from India for domestic consumption. This system of industrial protection was further consolidated by Walpole's custom reform of 1722 and the removal of export duties on agricultural and manufactured goods in 1699 and 1722 respectively [Minchinton 1969:13]. These measures were supplemented by the much larger effort in the 15 years after the accession of William III to the English throne when "the English tariff structure was transformed from a generally low-level, fiscal system into a moderately high-level system, which, though still fiscal in its purposes, had become in practice protective" [Davis 1966:307]. With the navy, the merchant marine and domestic industry nurtured in these ways English naval power became ascendent. That in turn helped in the acquisition of markets, supply sources and monopolies in a virtuous mercantilist cycle.[18]

Next came the wars and the resultant peace treaties. As mentioned above, the conclusion of the Methuen Treaty with Portugal in 1703 provided a stimulus to trade and helped in time to make London a major market in bullion, so cucial for pre-eminence in an age of metallic currency [Wallerstein 1980:191-93; Minchinton 1969:155ff]. Then with the Treaty of Utrecht, that ended the War of Spanish Succession (1702-13), England enlarged her American holdings at the expense of France who gave up her claims to the Hudson's Bay region, to Newfoundland, to St Christopher and ceded Acadia. These gains opened the way to westward expansion and the growing population of the North American colonies cultivated more land which eventually expanded exports of tobacco, rice, and indigo to England and wheat, beef, pork, livestock and lumber to the West Indies [Wallerstein 1980: 255; Minchinton 1969:14]. From Spain, England won Gibralter and the *Asiento* which gave English and colonial slave traders a crucial monopoly in the supply of African slaves, the most strategic resource of the Atlantic trade,[19] to the Spanish American colonies. With the Treaty of Paris, which brought the Seven Years War to an end, England gained Canada, Cape Breton Island and all the region east of the Mississippi. Florida was taken from Spain and most of the French colonies in India, Senegal and Goree in West Africa were also acquired. The annexation of Tobago, Dominica, Grenada and St Vincent in the West Indies was followed by the Free Port Act of 1766 by which the English state endeavoured to capture trade with the Spanish American empire [Minchinton 1969:17].

Along with the defeat of the Dutch on the Atlantic came their defeat on the Indian Ocean. Through much of the first half of the 17th century the EIC appeared to be fighting a losing battle with the VOC as the early Dutch monopoly of the Moluccan Islands and the seizure of Batavia in 1619 forced the EIC into concentrating on Indian textiles (that nonetheless proved to have a far more elastic market in Europe to the later advantage of the English). The upward trend of the EIC began to take hold only from 1661, though momentarily hampered by the Second and Third Anglo-Dutch wars of 1665-67 and 1672-74. The personal union of England and the Netherlands through the Glorious Revolution was a blessing for the EIC as it attenuated Anglo-Dutch hostility.

Next, came the creation of the British home market, that, in the first instance, received a fillip from the Act of Union with Scotland in 1707 that realigned the Scottish economy away from the Dutch and into the British Isles—a fact made evident by the withering of the Scottish Staple at Campveere in Zeeland [Lenman 1990: 48-54; Davidson and Gray 1909: Chapter 6]. Then, an intricate regional division of labour and the internalisation of production costs by enterprises, in the course of the "Industrial

Revolution", dramatically transformed the international regime of production and trade, with Great Britain relocated at the centre of the new regime of accumulation as the "workshop of the world" importing agricultural supplies and raw materials (grain, cotton, sugar) and exporting manufactured goods and machinery (cotton textiles, metalware, textile machinery, and railways).[20] Then, new sources of supply and expansion into new markets for textiles, textile machinery, coal, and railroads, generated an increasing velocity of trade till the 1870s that became the motto of the British regime of accumulation [Milward and Saul 1977:471].

The results of this reconfiguration of trade and the new international division of labour were evident in the volume, value and direction of trade flows. Through much of the 17th and 18th centuries the traditional traffic in English woollen cloth continued to play an important role but the newer trades proved to be more consequential in transforming the trading system as a whole and for later British hegemony. With growing extra-European trade and increasing volume of re-exports, English ports, especially London, became first an entrepot as well as a terminal and then a 'global city' providing information, management, and finances, especially financial management services, for the circuits of the capitalist world-economy. The most rapidly expanding trade was not in the indigenous manufactures of England but in the re-export of commodities brought from overseas as a consequence of the widening area of English overseas trade. Of these East Indian products—calicoes, saltpetre, indigo, silks and spices—tabacco from America and Mediterranean cotton, dyestuffs and raw silk were the most important. The slave trade acquired increasing importance in the 18th century. "Before the English civil war, re-exports were trivial; by the 1760s they were making a notable addition to English native exports; by the end of the century they added to that total no less than 50 per cent" [Davis 1969:111].

"Armed aggression was the heart of commerce", argued, George Clark, a historian of the 17th century (1947: 59). We have seen how apt that characterisation was for English successes in commerce in the west and in the east. We will now see how through much of the 17th and 18th centuries the same would hold for English pre-eminence in Europe itself. Intense intra-European conflict characterised that epoch and the British came out on the top because of their geo-strategic insularity that involved lower protection costs, and more importantly from our perspective, because they managed to mobilise the sums required for such extensive inter-state conflict without going bankrupt. As the geopolitical features are beyond the scope of this paper, we confine ourselves here to a discussion of the financial aspects.

Braudel agrees with Isaac de Pinto's assessment that the crucial English victory over the French in the Seven Year's War (1756-63) was a natural consequence of the mobilisation of English resources through the national debt, which in turn was a product of the English 'financial revolution'. In contrast, France, the other challenger to the Dutch mantle was disabled by its poor credit arrangement [Braudel 1984: 378]. The irony was that much of the capital mobilised by the English state and deployed to some extent against the United Provinces came from Dutch capitalists. But Dutch capitalists needed some guarantees and restructuring of the English financial system before they could invest in the English state wholeheartedly.

The English 'financial revolution' fulfilled that requirement and became a major tool, first, in the British challenge to Dutch dominance and then in holding on to her lead *vis-a-vis* France. The English/British financial revolution that was engineered between the 1660s and the 1720s [21] was the latest increase in scale for modern long-term debt, from Italian city-states to the province of Holland, than to the United Provinces, eventually to the UK. Like the Dutchm, the English financed their state building activity through loans. In less than a century, between the Nine Year's War (1689-97) and the American War of Independence (1775-83), the public debt had increased 15-fold in current prices from £ 16.7 million to £ 245 million. As aggregate borrowing increased with each successive war, so the proportion of wartime expenditure funded by borrowing rose. Credit accounted for 31 per cent of spending during the War of Spanish Succession (1702-14) and by the time of the American War (1775-83) 40 per cent of the expenditure was funded by loans. The state's dependence on loans meant more tax revenue had to be spent to meet interest payments. In no year after 1707 was less than 30 per cent of state income required to service debts [Brewer 1989: 114-16, 119]. Following the Dutch lead British debt-revenue ratio dramatically moved from 0.8 in 1692 to 8.5 in 1720, 10.4 in 1750 to a peak of 18.4 in 1784 [22] then declining to 8.4 by 1811 [Riley 1980: 116-17].

As mentioned before, in spite of all the innovations, the English financial revolution would have been a much muted affair without the interest of Dutch capitalists in English government securities. It was with the decline of Dutch monopoly over the Baltic trade, rising wages at home, and protection costs, that we witness a financial withdrawal of Dutch capital in search of an adequate rate of profit. At this time there was a general tendency of Dutch businesses to forsake the goods trade to specialise in finance (e g, the Hopes, the Pels, and the Cliffords). Dutch capitalists' interest in English government securities was evident from the million-pound English loan flotation in the Amsterdam market early on in 1692. Yet, the Dutch had generally refused to place their capital at the disposal of the English state fundamentally because of inadequate or unsatisfactory guarantees. Once the English financial revolution transformed that, the Dutch moved-in in a big way as English 'funds' afforded them convenient investment, higher interest rates, and a choice focus for speculation on the Amsterdam bourse [Braudel 1984:261]. The movement towards British investments peaked in the period between 1740 and 1780, when they became the most important investment after loans to Dutch corporate bodies.[23] So much so that a speaker in the House of Commons in 1737 expressed worries about Dutch control of British land mortgages [Wilson 1941:67].[24] The British then used the plunder of India, in the decades after Plassey, to buy back the national debt from the Dutch. A debt of about £ 25-30 million was rapidly liquidated in a few years after 1783. In the years 1757-66 pure plunder reached its peak and continued at a high level until 1774 after which it became disguised more and more in commercial forms. Estimates of the "drain of wealth" from India range from £ 100 million to £ 1,000 million for the half-century or so after 1757. Davis argues that "Indian wealth supplied the funds that brought [the] national debt back from the Dutch and others, first and temporarily in the interval of peace between 1763 and 1774, and finally after 1783, leaving Britain nearly free from overseas indebtedness when it came to face the great French wars from 1793" [Davis 1979: 55-56, Wallerstein 1989: 85, Carter 1953].

Though the English challenge to the Dutch had begun by the middle of the 17th century it was only after 1730 that the Dutch commercial system finally began to break down under the pressure of the English Navigation Acts. The terminal financial symptoms of the transition became visible only in a series of crises that hit Amsterdam in the years 1763, 1772-73, and 1780-83. While more and more of the profitable trade routes were monopolised by English merchants, and British industrialists spearheaded the reorganisation of the international division of labour, and both reinvested their profits in expanding trading and production systems, Amsterdam remained the greatest centre of international finance. Amsterdam plutocrats financed much of these British activities. But Amsterdam could fulfil this demand only within limits, after which came the financial crises as Dutch pecuniary supplies proved to be inadequate for the expanded world-system. The first crises, of 1763, was triggered by the end of the Seven Years' War (1756-63). The war had

necessiated an expansion in credit which was said to be 'fifteen times greater than the cash or real money in Holland'.[25] The bankruptcy of the Neufvilles in August 1763, because of their inability to produce the six million florins they owed, touched off the collapse of a system already under severe strain. Suddenly discounters could no longer discount paper and the whole credit structure came crumbling down, creating a currency shortage that spread from Amsterdam to Berlin, Hamburg, Altona, Bremen, Leipzig, Stockholm and London. In need of cash Dutch investors began to recall the capital they had invested in English stocks paralysing the Amsterdam Stock Exchange.[26]

Amsterdam's merchant bankers had just about re-emerged from the trauma of 1763 when the crisis of 1773 was triggered by the Clifford bankruptcy of December 28, 1772. The bourse ground to a halt, bankruptcies spread, and the Bank of Amsterdam in association with leading businessmen advanced two million florins in cash to ease the pressure. Yet, Braudel (following Charles wilson) argues that this crisis of 1773 was decisively different from the crisis of 1763 because the initial incident occurred in London not in Amsterdam. The collapse of the Cliffords was linked to the difficulties of the East India Company in Bengal. The crisis in london was quickly brought under control by the intervention of the Bank of England which suspended discounting of any doubtful bills and eventually of all paper. Amsterdam was hit the hardest, as the preeminent money and credit market was left by itself to back all the paper in circulation. In Amsterdam, for years confidence was never really restored among the merchant class. According to Braudel this was the crisis that showed that

> ...Amsterdam was no longer the centre or epicentre of Europe. This had already shifted to London. Can one suggest that a highly-convenient rule might operate in this context, to wit, that any city which is becoming or has become the centre of a world-economy, is the first place in which the seismic movements of the system show themselves, and subsequently the first to be truly cured of them? If so, it would shed a new light on Black Thursday in Wall Street in 1929, which I am inclined to see as marking the *beginning* of New York's leadership of the world [Braudel 1984:272].[27]

Kindleberger argues that in the previous crisis of 1763 the Bank of England and London private bankers had come to the rescue of their Dutch correspondents by granting credits larger than those previously given in periods of prosperity. Seven consignments of gold were shipped in two months, and in addition, English banks delayed presenting bills for payment. Such aid was based on the Knowledge that British prosperity was intimately associated with the flow of Dutch capital into England. Yet in the crisis of 1773 the Bank of England dumped all the pressure of the crisis on Amsterdam by refusing to discount paper (1989:203, 1978:183). Could it be that 1773 revealed the logic of all transitions where the old centre can no longer rule the system while the new is unable, perhaps unwilling too, to do so? How then can we explain English aid to Amsterdam in 1763? Could it be that in 1763 English merchants could not afford a shaky Amsterdam financial market and they aided the Dutch from a position of relative subordinations while their refusal to do so in 1773 was a signal of English arrival?

Amsterdam had ceased to be a world leader by the time of the third crisis, in the 1780s. In association with the fourth Anglo-Dutch war (1781-84) this crisis had a particularly devastating effect on Holland. Nominally, according to the Treaty of Versailles (September 3, 1783), the Dutch won that war, but they were financially exhausted and it was England that emerged the economic victor. The war contributed to the collapse of the Amsterdam *wisselbank*, which had advanced funds in the emergency to the city of Amsterdam, which in turn, had got involved in a futile attempt to rescue the terminally ill VOC. The VOC never recovered nor did the *wisselbank* [Kindleberger, 1984:48]. To make matters worse, following closely on its heels were the 'Patriotic Revolution' and the successful "Orangist Counter-revolution" brought about by English money and Prussian troops in October 1787. The United Provinces were caught in the power struggle between France and England and would witness another foreign invasion by Napoleonic France in 1795 that can be considered to be the symbolic date when all Dutch pretension to greatness ended [Braudel 1984:273-76].

Underpinning the three episodes of tumult in the financial markets was the evolving fiscal crisis of the Dutch state. The rate of increase of protection costs far outstripped revenues. The earlier withdrawal of Dutch capitalists into international finance had the effect of starving the United Provinces of tax revenues. Simon Schama shows how the effects of this escalation of costs and shortfall in revenues showed up in the debt charges of Holland. Its capital sum had risen from around 150 million guilders in 1678 to over 400 million in 1713. But mid-century retrenchment had succeeded in confining interest charges to below 15 million. By 1789, however, extraordinary loans, 'dons gratuits', lotteries and levies had begun to take their toll and in 1791 interest reached the record level of 18,276,015 guilders. On top of that, on the eve of the Batavian revolution in 1795, the debt of the now moribund VOC stood at 118 million guilders with yearly charges of around 4 million. Interest rates which throughout the century had remained around two-and-a-half per cent began to increase at the end of 1780s when rates of 4-5 per cent became common. By 1794 the government was resorting to contracts with financiers at even 10 per cent and more (1975:110-11). The disruption and expenses associated with the end-of-the-century wars and revolutions bankrupted the Dutch state and destroyed the financial market of Amsterdam and left London unchallenged in the sphere of international finance (Schama 1975:111).

III
Transition from British to American System (ca 1890-1945)

Before we describe the transition from British to US hegemony we will briefly sketch the essentials of the British system. It can be said in a highly condensed from that it was the successful creation of the national market and the deployment of state strength, two mutually constitutive elements of the European world-economy in the 17th and 18th centuries, that were crucial in the duel for world domination. The constitution of the national market as a well integrated division of labour, as in the English case, brought a renewed surge of power to the new centre that the city-centred economies, like the Dutch, could not withstand [Braudel 1984: 297]. France failed to produce either a competitive enough state or a national market to challenge the Dutch and the English. Consequently, the English beat their European rivals in the conquest of the markets of the New World; put their finances in order under Pitt's administration (while French finances went into a tailspin with the American Revolutionary wars); defeated the tea smugglers in 1785; established a more efficient administration in India Through the East India Bill in 1784; and established the first settlement in Australia in 1789 [Braudel 1984:379-82].

Perhaps the single most important factor that made the British financial regime so distinctive from the system that the Dutch dominated was the role of the empire, particularly India. It is the far more successful combination of territorialism and capitalism, as analytically separate logics, that distinguished the English from the Dutch and it was the prevalence of the capitalist logic in Europe and the territorialist logic in the east and the symbiosis between the two that made all the difference.

If the empire was acquired in a fit of absent-mindedness it was nonetheless with great rationality that its fiscal assets were exploited to the financial advantage of London.[28] Firstly, India's foreign trade was structured to realise a deficit with Britain but a large surplus with the rest of the world. That allowed Great Britain to square its international settlements on current account, which

in turn, allowed it to use the income from overseas investment for further investment abroad and to give back to the international monetary system the liquidity it had absorbed as investment income. Furthermore, according to Lindert's calculations, in 1913 British possessions in Africa, Asia and Australia held about $ 150 million deposited in London, of which $ 136.3 million belonged to the 'Government of India' (1969). By preventing India from transforming its annual surpluses into gold reserves the India Office contributed towards keeping British interest rates low. English banks were able to borrow from the India Office at 2 per cent and reinvest on the London market at 3 per cent [de Cecco 1984:63]. Secondly, manipulation of India's metallic currency allowed the British monetary authorities a much larger room for manoeuvre. For instance, with the discovery of gold in South Africa in the 1890s the British government feared that the market might be glutted so the imperial government ordered the minting of gold sovereigns in India but reversed the decision as soon as the Boer War put pressure on the gold supply.[29] Finally, and most importantly, the British Raj engineered a reversal of the traditional flow of bullion from the west to the east. As mentioned earlier tribute from India allowed the British to buy back their debt from the Dutch. The main component of this flow were the 'Home Charges': interest on debts to England incurred by the Raj to subjugate India; pensions of former civil servants living in England; payments to the War Office for the upkeep of the British-Indian Army and materials purchased in England on the Raj's account. The 'Herschell Committee' noted in 1893 that the main problem of the 'Government of India' was that it had to remit large sums to England every year that, for instance in 1873-74, amounted to £ 14,265,700 and had by 1892-93 increased to £ 26,478,415 [de Cecco 1984:63, 65]. The surplus which that tribute made possible freed the city's earnings for further commercial and financial transactions.[30]

The Raj played a crucial role in the international financial system of the 19th century but there were other British developments that though subsidiary were nonetheless important. First, similar to Amsterdam, London's control over world liquidity began with South American precious metal. Because of a combination of gold finds in Portuguese colonies (Minas Gerais in Brazil in the 1690s) and the construction of English-Portuguese trade that showed an increasing English surplus,[31] England dominated gold imports through the 18th century amounting to about 10 million rix-dollars a year in the first half of the century.[32] Yet, at the height of British hegemony, paper began to replace precious metals as the increasingly acceptable store of value and the British dominated the system of issuing bank notes from the very first. In the issuing of bank notes Great Britain became the most proficient, making the British monetary regime somewhat different from the Dutch regime of finance. By 1698 the Bank of England had notes in circulation payable on demand worth £ 1,340,000. By 1720 this total had risen to £ 2,480,000 (smallest denomination £ 10). Many provincial banks in England and Scotland issued their own notes too. In all, it is estimated by Parker, that the total value of paper credits circulating in early 18th century England was about £ 15,000,000 as against a total coin and bullion stock of £ 12,000,000. The financial innovations of the later 17th century had expanded England's total monetary stock by 25 per cent without an equivalent increase in the amount of bullion . No other European country at that time managed to create money on this scale in this way [Parker 1974:552]. It was not only a matter of creating paper money, but also of managing its creation in a manner that would keep the pound-sterling stable. The British banking structure took care of both these aspects: creating money through country banks and the Bank of England and controlling it through the sterling-gold standard.

The British were also the first to establish a national banking network. Within a decade of the legislation of 1833 (that explicitly allowed joint-stock banks in London) about 150 banks had been established which with their branches accounted for almost 600 bank offices [Cameron 1982:104].[33] In 1865, Walter Bagehot testified before the French *Inquiry into the Principles that Govern Monetary Circulation*, that the banking system of England was superior to that of France in transferring savings from households to industry, since each village in England had at least two banks, "thanks to which no shilling of savings was lost" [cited in Kindleberger 1984: 87-88]. Larger networks and larger assets meant greater stability. In addition, the growth of British deposit banks placed at the city's disposal a huge quantity of funds which could be used to finance world-wide trade.

The central principle behind the smooth functioning of the British financial system was a stable banking network that mobilised vast amounts of capital and the Bank of England's monopolistic control over the reserves of the system that ensured convertibility at all times. The Bank of England's control over the domestic money supply and sterling's world role were made possible by the centralisation of the domestic banking and monetary system under the monopolistic control of the Bank of England (as envisaged by Peel's Bank Act of 1844).[34] The city's interest in free trade and convertibility, the Treasury's attempts to maintain a tightly balanced budget that kept the state solvent, and the Bank of England's control over the reserves of the national and international system, made it possible to establish the distinctive institutional nexus of British financial hegemony: the City-Treasury-Bank of England nexus [Ingham 1984].

If the nexus of the City-Treasury-Bank of England was the institutional site of governance of the international system, international financiers like the Rothschilds were the sinews of the British system connecting the world through sterling loans.[35] They were the most important agents that marketed public loans in the London money market. Government patronage and an all-European network, that provided both connections and information, was what gave the Rothschilds the decisive edge. The Rothschilds were part of a larger circle of merchant bankers who had jumped on the boat of British industrial expansion only to emerge by the mid-19th century as the 'central bankers' of Imperial Britain by pulling out when profits were still high [Arrighi 1990:86; Chapman 1977]. The importance of the Rothschilds, among other merchant-bankers, for the British regime of finance can be gauged from Hobson's comment:

> These great businesses—banking, broking, bill discounting, loan floating, company promoting—form the central ganglion of international capitalism... No great quick direction of capital is possible save by their consent and through their agency. Does any one seriously suppose that a great war could be undertaken by any European state, or a great State loan subscribed, if the house of Rothschild and its connections set their face against it? [Hobson 1938:56-57].

The protection and preferential treatment which the Rothschild financial network received from Imperial Britain had its counterpart in the incorporation of that network in the apparatus of world rule deployed by Imperial Britain. "Pax Britannica held its sway sometimes by the ominous poise of heavy ship's cannon, but more frequently it prevailed by the timely pull of a thread in the international monetary network" [Polanyi 1957:14].

To reiterate: till the 1880s London operated unchallenged in the international field. Sterling's stability had been maintained by government directives to the Bank of England, and it had prevailed over all other currencies as the most stable and efficient vehicle of trade, attracting more and more capital to itself. The London accepting houses had assembled unique experience in assaying commercial paper from all over the world. The growth of British deposit banks and the stability of the sterling, placed at the city's disposal a huge quantity of funds which could be used to finance world-wide trade. The politically servile reserves of the Indian monetary system provided a large *masse de manoeuvre* which British mon-

etary authority used to supplement their own reserves and to keep London at the centre of the international monetary system. From 1890s onwards, as trade, production and profits shifted to non-British hands, especially German and American, financial centres emerged that challenged London's centrality.

From the Barings Crisis in 1890[36] it was evident that the international financial system was catching up with the competitiveness and resultant restructuring that was developing in the world of production and commerce since the 1870s. As the sterling-gold standard became an international gold standard, Paris, Berlin, and New York developed financial institutions that came to threaten London's monopoly. As the political climate deteriorated with the collapse of the Continental balance-of-power, what changed was London's capacity to be the repository of the world's ultimate gold stock. Paris and Berlin no longer considered the departure of their gold reserves (so essential for the working of the gold standard) with equanimity. But it was the behaviour of the American Treasury with the size of the American market behind it, that was crucial for the demise of the gold standard.

US bankers used the London money market as its central bank, as it did not have one of its own until 1913. London thus had to absorb all the seasonal oscillations in the American demand for money. The US on top of that, unlike the politically pliant 'India Account' absorbed huge amounts of gold, keeping with the resurgent protectionism in the world economy. The US Treasury being the principal glutton along with, the national banks, and the farmers. In 1889 the combined gold reserves of the US Treasury and the national banks grew to £81m out of a total world official reserves of £296m; in 1899 they stood at £124m out of £504m; and in 1910 they totalled £273m out of £867m. The reserves of the three centre-countries combined—Great Britain, France and Germany—were worth no more than those of the US alone. The Bank of England was left to control the London money market with a puny average gold reserve of only about £30m. That too in a system in which the gold recycling mechanism, which worked well as far as the colonial territories like India were concerned, was only partially effective where independent primary exporters such as the US was involved [de Cecco 1984:120,125].

Troubles in the financial system were reflections of the changing configuration of the trade network. The smooth functioning of the sterling-gold standard was dependent on British industrial supremacy and trade surpluses, both of which were compromised by the relative rise of the US and Germany. Then the first world war further eroded the centrality of the British economy. First, the war weakened the trade balance of European powers, particularly Britain. On the one hand British exports decreased as a result of the diversion of resources for the war effort, and on the other Great Britain had to increase its imports of war related products, especially from the US, which in turn stimulated American heavy industries.[37] The immediate consequence of the increase in imports and decrease in exports was that Great Britain generated a huge trade deficit.[38] These factors acting together contributed to the collapse of the sterling-gold standard in March 1919 when the pound was officially devalued. Repeated but unsuccessful attempts by the British state to re-establish the dominance of its own currency followed. Second, the war strengthened the financial power of the US while weakening Great Britain's. Since the first world war was mainly a European war, the American business environment could avoid disturbance. In fact, the war made the US a net creditor in relation to the rest of the world.[39] During and after the first world war the US became the principal supplier for new international capital flows.[40]

The trend of relative British decline continued through the inter-war years. Relative to other great powers, "the 1920s were, except for 1929, a lost decade for the United Kingdom" [Kindleberger 1973:58]. With increasing industrial self-sufficiency of the US and the reconfiguration of trade the British had come to depend more and more on their financial services to retain their edge. Here too British transnational banks and financiers were soon faced with a changed world. As Geoffrey Jones put it:

> Regulatory measures and exchange controls altered the parameters of banking as it had existed before 1914. Competitive pressures increased in many places. In some cases, such as Iran and Australia, state-owned institutions combined central and commercial banking, to the chagrin and dismay of the British banks. These changed conditions meant that barriers to entry began to rise for British institutions, but decline for those of other countries... The changes in industry structure worked almost uniformly in the direction of reducing the competitive advantages that British banks enjoyed and developed prior to the First World War. In the area of cost, dollars began to rival sterling in the settlement of international transactions, especially in some areas of Latin America. Exchange controls, and other problems greatly curtailed the floating of foreign loans on the London market. New local institutions competed vigorously for deposits. Bank Misr in Egypt and Bank Melli in Iran were two examples in the Middle East. The ability to moe funds between countries was disrupted by exchange controls and exchange instability (1990:43).

Nonetheless, it must be pointed out that even though Britain's economic power was decreasing it kept its extensive financial networks and its role as an important (if not the) international financial centre after the first world war. Moreover, in spite of the emergence of the dollar and, to a lesser extent, the franc as competitors, sterling maintained its role as the world's leading currency. Pound-sterling reached the peak of its importance between 1860 and 1914, when about 60 per cent of world trade was invoiced and settled in sterling. The descent from that peak was gradual and slow and as late as the early post-second world war years, the pound was still the world's most important transactions and quotation currency, accounting for perhaps half of all trade [Cohen 1971:71-72; Brown 1940:143,145]. Yet, things were beginning to change for the worse for the British currency.

In the panic of 1907, US bankers realised that the weight of the American economy had become 'too big' for Europe to underwrite in times of crises. After years of bitter debate president Woodrow Wilson signed the Federal Reserve Act on December 23, 1913. This provided a rediscount market for dollar bills of exchange that increased the use of dollar as a means of exchange and as a means of payment in international trade and encouraged American banks to participate in international banking business [Abrahams 1967:10-11,50-51]. After the outbreak of the first world war, "the Federal Reserve Board further increased the use of dollar exchange in 1916 by obtaining from the Congress an amendment to the Federal Reserve Act that allowed American banks to accept bills of exchange in dollars that were used to finance trade between nations other than the US. This facilitated the replacement of sterling with dollars as the medium of exchange between South America and Europe. As a result, shipments of merchandise from Holland to Argentina, for example, and of coffee from Brazil to Italy, were financed in dollars. By the end of 1916, New York banks had acceptance liabilities in the neighbourhood of $150 million; all of America's banks held between $200 and $250 million" [Abrahams 1967:53-54].

As mentioned before, the strengthening of the US financial power came mainly from its huge trade surplus. As a result the American gold stock tripled between 1914 and 1930 (continuing an earlier trend discussed before) and American gross external assets quadrupled, far outgrowing foreign claims on the US. In terms of comparative capital flows, "from 1924-29, the US loaned abroad some $6,400 millions and the UK $3,300 millions" [Kindleberger 1973:56]. The outflow of capital from New York, which were accelerated by the Dawess Plan in 1924, had surpassed those from London in the 1920s [Drummond 1987:36; Kindleberger 1973:38-39,54].

The late-1920s and the early-1930s were characterised by unprecedented financial instabilities. As instability spread through the system, a speculative boom took hold in the New York stock market and its collapse was one of the most memorable and dramatic expressions of the crisis of the inter-war years. The stock market bubble was formed during the period of sustained growth of the 1920s. The engine for prosperity of the 1920s was the emergence of large-scale commercial and industrial enterprises that took advantage of new continuous process technologies and more efficient vertical integration [White 1990: 146]. The financing needs of these new industrial and commercial enterprises altered the face of American capital markets. These firms rapidly came to dominate the equities market. Between September 1916 and September 1928 many of these companies like Allied Chemical, American Locomotive, AT and T, American Tobacco, International Harvester, Mack Trucks, Sears Roebuck, Western Union and Woolworth were added to the list of companies whose shares were traded on the NYSE. These large firms preferred to raise funds out of retained earnings and new stock issues rather than through bank loans. This left commercial banks in a quandry and they started looking for new sources of income. Commercial banks could not directly trade in securities, hence, to circumvent the legal restriction they set up wholly-owned security affiliates which entered investment banking and brokerage business. Charging sometimes one quarter of the New York brokerage commission these commercial banks developed a large new pool of potential clients in their depositors. A large number of small investors were drawn into the market first through investment trusts set up by these banks that had fixed portfolios (largely blue chip) and then through managed trusts that played the market more ambitiously. The influx of many new people and the excitement about the potentialities of new managerial styles and organisations (for instance GM) and new technologies (for instance RCA) made it difficult to evaluate market fundamentals. Old information and control systems proved to be inadequate. Bankers got 'pulled' directly into the market for short-term call-money loans and this expansion of credit encouraged investors to become dangerously leveraged. By 1928 the market began to take a speculative turn. As competition increased in the real sectors of trade and production investors began to concentrate more and more on speculative profits that were to be had in the NYSE, further starving the real sectors of investments. The inevitable crash followed triggering the Great Depression [White 1990; Galbraith 1988].

The international debt crisis of the 1930s was another expression of the financial chaos. The debt crisis unfolded in three stages. It was Latin American defaults that overshadowed the first phase which covered the entire year of 1931 and extended to the following years. On the first day of 1931 Bolivia began to default on its dollar obligations and within a short time its Latin American neighbours followed [Fishlow 1986: 82]. In the second stage the default spread to southern and eastern Europe from 1932 to the middle of 1933. Finally, the third stage was dominated by the German default that coincided with the Monetary and Economic Conference of 1933 [Eichengreen and Portes 1990:74].

The collapse of the NYSE and the international debt crisis sent a wave of bankruptcies through the banking structure. Carlos Marichal describes the unfolding banking crisis succinctly:

> The first signs of a weakening of the banking system came from the US as a run on banks in the south-east almost provoked a national panic in mid-1930. The weakest link of the international financial structure, however, was not in the US but in Europe. The crisis, exploded in May 1931, when the great Credit-Anstalt bank of Vienna collapsed. The run then shifted to Germany and provoked the fall of the even larger Danatbank. By late July the London money market had begun to crack under the strain, and on September 21 Britain went off the gold standard. Another twenty-one countries followed the British example, and exchange controls were established by governments of thirty-one nations around the world [Marichal 1989:209].[41]

The period between 1914 and 1925 was also marked by large exchange rate fluctuations. Consequently, Churchill, under influence of the city and with the interest of London in mind, decided to return to the Gold Standard at par in 1925. It was no surprise that the city of London was interested in restoring its pre-war position as a world financial centre. Nor was it surprising that many leading European businesses backed the return to gold because they were interested in exchange rate stabilisation. However, at first sight it is a little surprising that the US put continuous pressure for sterling's return to gold. Kindleberger argues:

> Not only Benjamin Strong, the Governor of the Federal Bank of New York, but Secretary Mellon, and a host of other Federal Reserve officials, were unhesitating in informing Norman in December 1924 and January 1925 that the time had come. Syrong's views were partly based on world considerations: the need to eliminate the malign effects of disturbed foreign exchange markets on world trade; and partly on two national grounds: the hope (a) of reversing the flow of gold to the US, and (b) of gaining international lending business for New York as a consequence of higher interest rates in London (1973:47-48).

Yet, the post-war gold standard not only failed to provide stability, but caused further trouble. The first problem of the inter-war fixed exchange rate system was that it was a 'gold exchange standard' instead of a sterling-gold standard. The weakness stemmed from its attempt to economise on the use of gold (something necessary given the limits of gold supply) by enabling countries to hold a portion of their reserves in foreign exchange. Since the supply of new gold was relatively inelastic, the incremental liquidity of the expanding international economy took the form predominantly of sterling and/or dollar. Once the stock of sterling or dollar claims held by foreign central banks approached the value of British and/or the US gold reserves, the British and/or the US commitment to peg the sterling and/or the dollar price of gold would no longer be credible.

> The existence of two reserve currencies, sterling and dollar, enhanced the ease with which central banks could shift between them. Since the US gold stock was sufficiently large relative to foreign claims, once the suspension of convertibility by Austria and Germany in the summer of 1931 drove home the riskiness of exchange reserves, central banks and others began to shift out of sterling, the weakest reserve currency. Britain's forced devaluation in September 1931 then shifted pressure towards the dollar. The fed responded by tightening credit, which intensified pressure on foreign central banks ... [Eichengreen 1992:385].

In much of the literature, the gold standard is portrayed as synonymous with financial stability. However, in the 1930s, the opposite was true (ibid: 394). "Between 1918 and 1925 people had too often said that London's financial strength before 1914 was due to the gold standard. The truth was rather that the strength of the gold standard was due to London's international financial position" [Sayers 1990:295; also see Fearon 1979:22]. Telescoped between 1925 and 1933 were a series of crises in the exchange rate mechanism, the securities market, the debt market, and the banking network that destroyed all semblance of order in the international financial system.

The extraordinary troubles of the inter-war years were rooted in the fact that in spite of its economic pre-eminence and trade surpluses the US financiers either refused to or could not replace the British in supporting the systemic needs of the new world economy.[42] Certain American actions further aggravated the situation. First, the passage of the Hawley-Smoot tariff in 1930 indicating a new wave of protectionism in the US,[43] further destabilised the equilibrium of the world economy. Before 1914 unilateral British free trade had provided debtor countries a certain market for their exports and hence provided them opportu-

nities of earning foreign exchange for servicing their debt. However, the American refusal to do the same meant that the world market was no longer stable since neither Britain nor France were able to do so. With the US protection indebted third world countries, especially of Latin America, found it more difficult to earn foreign exchange that had already become difficult with the decline in prices of major primary products through the late 1920s. Second, the momentary reduction in capital export from the US in the late-1920s also contributed to the collapse of the world economy.[44] This was so because once the generation of export surpluses by the weaker economies (ie, debtors) was blocked by protection, the only other route left for global equilibrium was continuing capital exports so as to provide the foreign exchange necessary to service outstanding debts and finance deficits [Fishlow 1986: 79; Kindleberger 1973:130]. The reason for the momentary reduction in American capital outflow was mainly internal. Due to the speculative surge in stock market in the second half of the 1920s, investors turned to the domestic stock market thus crowding out foreign issues [Kindleberger 1973: 124-25]. "The mounting boom on Wall Street diverted American funds from foreign to domestic uses and like a powerful suction pump siphoned off liquidity from the rest of the world... Net short- and long-term foreign lending by the US had exceeded $ 1,000 million in 1927 and reached nearly $ 700 million in 1928... In 1929 net short- and long-term lending by the US turned negative, and the $ 800 million bill [of debt service payments on dollar debts] came due" [Eichengreen and Portes 1990:75-76]. The next external shock to the indebted regions came in term of an increase in real interest rates that got underway since the Spring of 1928 and by late-1929 short-term real interest rates had risen to more than 15 per cent [Eichengreen and Portes 1986: 612]. Protection of the domestic market, speculation on the NYSE, and rising interest rates made the debt crisis inevitable. Apart from these destabilising measures the US government further added to the disturbances in the world economy by its refusal to write-off war debts. For Britain, France, Italy, and Belgium, reparations and war debts could not be treated separately. They were willing to exchange German reparations for their war debts owed to the US. However, US financiers refused to accept reparations from Germany and to cancel war dents owned by other European countries. Although eventual American settlements were made with 13 countries on February 1922 it did not avert a continuing need for European countries to send significant payments to the US [Fishlow 1986:71; Kindleberger 1973:41].

IV
Present Transition from Bretton-Woods System

The first attempt at creating a new regime came with the establishment of the Bretton Woods System in July 1944. Under the Bretton Woods agreement, the gold standard was replaced by a system of pegged exchange rates. Countries were allowed to change the exchange rate of their currency only with certain range, when cases of 'fundamental' disequilibrium appears in their balance-of-payments accounts. Each major country would maintain the exchange-rate of its currency either by intervening in exchange markets to keep its currency within a range of 1 per cent above or below its par value or by exchanging its currency for gold at a fixed exchange rate. The American Federal Reserve volunteered to buy and sell gold at the rate of $ 35 an ounce so as to maintain the stability of the dollar and transformed the new regime into a dollar-gold standard [Gowa 1983:35]. Moreover, two fundamental institutions of the new international financial regime, namely, the International Monetary Fund (IMF) and the World Bank (WB), were formed. The former was mainly established for exchange-rate stabilisation and maintaining international financial discipline, while the latter aimed at 'rebuilding' the economies of the underdeveloped countries.

But, the Bretton Woods system grew too slowly to solve the immediate European post-war economic problems. It was against this background that the US, first, proposed the British Loan (1945), and then the Marshall Plan (1948). Several years into the Marshall Plan the dollar gap was still a major problem and most European trade continued to be organised along bilateral lines, and no major European currency was yet convertible [Block 1977:109]. The dollar gap persisted because US private investment failed to take hold in Europe in the 10 years after the second world war. Barriers to profit repatriation due to foreign exchange controls seemed to be the main problem [Frieden 1987:76]. The rearmament policy, initiated since the early 1950s, finally solved this problem by pumping in millions of dollars into Europe. Supplementing military aid, the stationing of large numbers of American troops in Europe greatly increased the dollars earned by European countries. Furthermore, the prosecution of the Korean war and the establishment of a network of military bases around the globe also increased the flow of dollars into foreign hands. The outflow of dollars for direct military expenditures in the US balance of payments increased from $ 576 million in 1949 to $ 2,615 million in 1953 reaching a peak of $ 3,435 million in 1958 [Block 1977:115]. The Korean war was in many ways Japan's Marshall Plan and soon enough the European and East Asian economies recovered. Like the other two hegemons before it the US government in expanding the world-economy had undermined its own relative power in the long-run.

In line with historical precedents the very expansion of the system since the 1960s became a source of instability for it. Just as British Free Trade and investment in railroads all across the globe had brought home huge profits and expanded commodification, yet encouraged competitive industrialisation, US businesses did very well under US hegemony but so did the economies of Europe and East Asia. They in turn eventually posed challenges to US hegemony. The Eurodollar market played a particularly important role in the latest financial expansion. Its market gained momentum in the second half of the 1960s after the expansion of west European subsidiaries of US TNCs.[45] Much of the profits of these subsidiaries were reinvested in western Europe which contributed crucially to the rapid development of the Eurodollar market. One of the most important characteristics of the Eurodollar market was its unregulated nature. It was an off-shore market which neither the country of origin (US for instance) nor the host country (UK) controls. That helped it to become more competitive than the domestic financial markets. Eurodollar banks could offer higher interest rates to depositors and lower interest rates to borrowers since they were not subject to restrictive reserve requirements. US capital was thus attracted to the Eurodollar market. That put pressure on the already worsening balance-of-payment situation in the US. From the mid-1960s, the US government attempted to control capital outflows. However, despite controls that lasted until 1974, American TNCs which were increasingly financed out of borrowings abroad and profits did not stop investing overseas. Even worse, these restrictions speeded the outflow of American capital by pushing American banks into the unregulated Euromarkets. "By 1970, the Euromarkets' net size (that is, substracting transactions among banks themselves) was $ 65 billion, and three years later it reached $ 160 billion" [Frieden 1987:85].[46] This outflow of capital put pressure on the Bretton Woods pegged exchange rate mechanism as the over supply of dollars in Europe put downward pressure on ts exchange rate *vis-a-vis* European currencies that eventually led to the closing of the 'gold window' in 1971 as American gold reserves were running out. Involvement in the Vietnam war further worsened the balance of payment deficit of the US.[47] The fixed exchange rate system completely collapsed in 1973 and it was now left to the market to determine the value of currencies.

An important ramification of the unregulated Eurodollar market was to generate a deregulation market force, pushing other financial centres to offer similar facilities and freedom to banks and operators.

> **The dominant trend in US domestic policy-making through the past decade under Presidents Ford and Carter, as well as President Reagan, has been toward deregulation... [for instance] ceilings on deposits left for less than six months were lifted in 1970; and ceilings on demand deposits were lifted in November 1978. In 1980, the process of deregulation was greatly speeded up by the Depository Institutions Deregulation and Monetary Control Act which will result in the total elimination of all controls by 1986 [Strange 1986:52].**

Even in Japan, the least susceptible country to foreign penetration, deregulation has been gaining momentum.[48] In addition, the two major Asian financial markets in Singapore and Hong Kong also reduced taxes and relaxed the regulations pertaining to bank deposits and loan activities. Even Taiwan and South Korea, which are famous for their tight controls over the financial sector by the state, are also liberalising their banking system.

Financial innovations have also kept much of the financial market out of the regulatory reach of the old institutions of control. For instance, the development of non-banks as competitive substitutes for banking services, such as money-market mutual funds, credit cards, and smart-cards have undercut regular banking services because the non-banks are less tightly regulated, particularly in terms of the amount of capital they are required to keep as reserve. Effectively raising the relative cost of capital for banks and at the same time thinning the liquidity cushion of the whole system. It is not only the creation of new forms of money but also the electronification and globalisation that has kept much of the financial market of the 1980s and 1990s out of the regulatory reach of states. Finally, newer centres have emerged and/or some older centres have increased their relative power such as the Tokyo-Singapore-Hong Kong web that are not amenable to American control.

We have seen that in the past when the system expanded to include new actors and new sites of capital accumulation, old regimes and institutions of governance turned out to be inadequate. The present transition is reminiscent of the period in the 18th century when the entry of Brazilian gold under English control (since the 1690s), the explosion in share capital (especially the birth of the London stock exchange), and the entry of the British national market, with its paper currency, into international trade and financial networks expanded the system and yet destabilised it. The Amsterdam *wisselbank* and the Amsterdam stock exchange proved to be inadequate in governing the system. Institutions grounded on British soil like the branch banking network that mobilised a large new mass of money capital in paper currency and the Bank of England that operated the gold standard so as to maintain the stability of this paper currency took over the role of establishing a new international regime. By the end of the 19th century with the real internationalisation of the gold standard and the competitive industrialisation of the US and Germany the international trade regime underpinning the 19th century financial system was undermined and the Bank of England could no longer play the role of the international monitor. Important central banks in a more deeply institutionalised and statist system had to be led by the American Federal Reserve through the crisis of the inter-war years to establish the Bretton Woods arrangement that saw the birth of multilateral institutions of control such as the IMF, and the WB. Similarly, the expansion of the Eurodollar and the East-Asian market has thrown the old regime into disarray. Unregulated non-banks and the linking of financial centres (New York and Chicago in the US; London, Frankfurt and Paris in Europe; Tokyo, Singapore and Hong Kong in Asia) through fibre optic cables, has turned the international financial system into a 'global casino'.[49]

The present financial expansion, like others preceding it, is happening mainly due to stagnation, or even declining prosperity, in the real economic sectors after 1968.[50] The profit rate of manufacturing and business in the seven most advanced capitalist countries (US, Japan, FRG, France, UK, Italy, and Canada) in 1973 was only 80 per cent of the peak year of the 1960-73 period [Itoh 1990:52; Glyn et al 1990:77]. As a result we have today the most unfettered speculation seen in the US since 1929. One simple indicator of this is the jump in the average number of shares of stock traded daily on the NYSE from 19 million in 1975 to over 200 million today. Even more striking is the expansion in the trading in futures contracts that grew from 3.9 million in 1960 to 11.2 million in 1970, to over 92 million in 1980 reaching over 220 million in 1987! [Sweezy and Magdoff 1988:21]. This kind of financial expansion has generated an institutional overload for the old system of regulation which has for all intents and purposes crumbled. Everywhere de-regulated global markets are getting out of control of even the major states.

Transitions are characterised first by unregulated credit expansion followed by retrenchment that brings in its wake bankruptcies, runs on banks, debt crisis, and stock market collapse. Falling interest rates throughout the 18th century ended with the late-18th century retrenchments that kept interest rates high for a long time, especially in Amsterdam. Similarly, the manias of the late-19th and early-20th centuries ended in inevitable panics before a new regime was put in place under American dispension. In the present transition we have already witnessed the souring of speculative manias of the 1980s with the new international debt crisis, collapse of the real estate market and the resultant S and L crisis, and Black Monday alongside the widening American budget deficit that is putting additional upward pressure on long-term interest rates.

Systemic chaos characterises the terminal phase of the transition. Systemic chaos is born out of the fact that during transitions there are at least two non-congruent trajectories: one of the rising hegemony and other of the declining power. While hegemony is a delicate balance between competition (inter-firm and interstate) and order, transitions are marked by the tipping of balance towards the pole of intensifying competition. Competition leads to instability and financial instability expresses itself in exchange rate fluctuations, banking crisis, debt crisis, etc, that encourages speculation as well as shorten the time horizon of capitalists and states alike. Hegemonic regimes degenerate into systems of pure domination where the strongest capitalists and states exercise their power unilaterally further exacerbating conflict in an already competitive environment. In the present transition, the volatility of the international financial system reached a critical point in 1970s when the US government could no longer control global dynamics and decided to deregulate and aid in the increasing strength of the market over the state in the hope of benefiting from this transformation. For instance, the floating exchange rate, which was basically a decision to let the market decide the exchanges, gave the US monetary authorities a free hand in determining world money supply and interest rates. American unilateralism has increased the uncertainty arising from the markets and furthermore it has even encouraged the formation of new markets dominated by uncertainty such as the Eurocurrency market and various futures markets [Strange 1986:106].

For instance, the Eurodollar boom in the 1970s, in addition to the huge surplus of Petro-dollars from the OPEC since 1973,[51] forced the commercial banks to find outlets for these surpluses in needs of states, especially the US and third world countries. On the demand side, third world countries eagerly engaged in rapid industrialisation, had high incentives to borrow money in the 1970s because of the extremely low interest rates (the LIBOR real rates in 1974-77 were negative). Consequently, when the US budget deficit put upward pressure on real interest rates, that rose in the 1980s, the debt

service burden of third world countries dramatically increased. An international debt crisis broke out that put tremendous pressure on US multinational banks.

Then there was the dramatic securities market crash in October 1987. The crash of October 1987 may have been a signal of the limits of expansion within the old regime, somewhat akin to the boom and bust of the 1920s which came in the wake of major structural changes in the economy of the US. Which, in turn, has further parallels with the crises of 1873, 1720 and perhaps even 1634-37. The first analogy is that in all these instances major trouble was confined to and/or began at the future centre and the growing sectors of the world-economy and it was this centre and the ascendent sectors that bounced out of the crash the quickest, confirming Braudel's rule of the thumb (Section II). It is no mere coincidence that in the 1920s, industries such as RCA, GM and the utilities that spearheaded a series of innovations in technologies, organisations, and methods of financing, also led the speculative boom in the stock market. New organisations, and products fed a rightly placed optimism about future incomes but without the benefit of newer tools to evaluate such expectations accurately. They were changes outside anyone's experience making it impossible to define market fundamentals. Similar potentialities and yet difficulties to concretely evaluate opportunities for profit was also the basis of the 1873 crisis in US railroad securities. The railroads, which had previously provided only locally integrated systems of transportation, were being forged into a nation-wide network parallel to the unification of the utilities in the 1920s, creating great expectations. Speculation and collapse born out of genuine difficulties in evaluating market fundamentals was also at the root of the South Sea Bubble of 1720 and the Tulipmania of 1634-37. The South Sea Company's planned conversion of government debt from a mass of highly illiquid annuities into modern securities along with the influx of a mass of investors were both quantitatively and qualitatively a new phenomena that made it difficult to evaluate the fundamentals, though the associated excitement about shares in the London market correctly predicted the future centrality of that market. Similarly, the arrival of the tulip from the Near East as a new asset in Dutch markets, along with the dramatic extension of practices of shareholding and -trading and the associated influx of new investors led to the speculative boom and the consequent collapse, once again correctly predicting Amsterdam to be the new centre of accumulation and a market in shares as the new means of reshuffling of surpluses [White 1990: 235-40]. Secondly, the crises of 1634-37, 1720 and 1873 primarily affected the emergent hegemon and all of them could be said to be a product of overenthusiasm about the prospects of the market in the new centres—UP, UK, and the US respectively—nonetheless correctly signaling the trends of the future. They were all instances of overshooting an essentially correct assessment. In all three cases the market exhibited an awareness that something new and promising was on but failed to evaluate the exact extent of that promise, which is not at all surprising given the inadequacy of old systems of information gathering and regulation for what were qualitatively new phenomena. The NYSE's boom and bust in 1929 similarly predicted the centrality both of the NYSE and company financing through securities. However, the far greater global effect of the crash of 1929, compared to other crashes under discussion, may have been because of the overlap of this signal crisis with the terminal crisis of the transition.[52] In that historical light, could the boom and the bust of 1987 be similarly characterised as a case of overshooting an essentially correct future trajectory? It may be relevant that, in terms of the magnitude of the boom it was the Tokyo Stock Exchange that led the way [Wood 1989:57]. In that case, the near global simultaenity of the crisis of 1987 may have been a product of the global electronification of exchanges and computerised trading rather than the sign of a terminal crisis.

Since such booms and busts are the product of things new and 'unknown' and are a result of the inadequacy of old information and regulatory systems it is doubtful whether such instabilities can be prevented in the present transition. Change in fundamentals, with the arrival of east Asian financial power and Japanese style corporations, and greater globalisation would make it so much more difficult to legislate or regulate future crises out of existence, notwithstanding the Brady Commission's attempt to introduce circuit breakers. Only new information and regulatory systems can stabilise the newly configured market for any length of time and we may have to go through the purgatory of a long crisis to institute these new mechanisms, and in all probability we can only do that after all attempts to tinker with the old system is exhausted and their limits made evident to all. In the long run, the crash of 1987 may register more as a signal crisis of the transition, akin to the crisis of 1873, 1720 and 1634-37, rather than as the terminal crisis of 1929. In that case we have a long transition ahead of us.

Exchange rate instabilities, international debt crisis, bank failures and stock market crashes that are already upon us today are expressions of financial expansion that have historically been associated with hegemonic transitions. It remains to be seen whether the big financial powers like Japan, Germany and the US can collectively lead the system or, as in the past, one pre-dominant power has to emerge to establish order. Of course the system can go on for a long time in the present state of festering crisis and partial solutions. All depends on the evaluation of the costs of the present crises by influential capitalists, policy-makers and states.

Comparing hegemonic transitions we can notice other parallels beyond financial expansion, chaos, intensifying competition, and non-congruent trajectories. Firstly, the obvious: all financial transitions are born out of a reconfiguration of trade and production. When the centre of gravity of trade moved from the Baltic to the Atlantic, London replaced Amsterdam as the hegemonic financial centre. By the late 19th century with further industrialisation and the making of national and continental economies the centre of gravity moved from London to the US. Today, as the primary engine of capital accumulation moves to east Asia and the Pacific Rim, east Asian financial markets have emerged to share the spoils with London-Paris-Frankfurt and New York-Chicago in a tripolar world. Secondly, with increasing competition and declining profit rates in manufacturing and trade during transitions, we witness a marked tendency of capital to withdraw into financial speculation. As wages and taxes rose, Amsterdam merchants withdrew from trade and production to invest in British bonds,[53] the British, in turn, became an increasingly rentier nation once the railroad boom was behind them by the middle of the 19th century, and in the present transition, with declining prosperity in the real economic sectors after 1968, real estate dealings, currency speculation and junk bond powered corporate takeovers seemed to be the only sectors to show any prospects of expansion. The speculative boom of the Dutch withdrawal lasted the longest from circa 1660 to circa 1790, while the financial boom of British decline lasted through much of the second half of the 19th century into the interwar years, and the American speculative boom has lasted about two decades in the last 20th century. Yet there are differences. When the Dutch withdrew from production they invested massively in English bonds, shares and mortgages reaching a peak between 1740 and 1780, similarly when the British withdrew to the relative safety of high finance they showed a marked preference for American investments, yet, when American corporations began to withdraw into financial speculation they depended on the Japanese to finance the deficit at home (which added up to over a hundred billion dollars a year in investments and purchases of Treasury bonds). By 1982 Japan had become the major exporter of capital and the US had become the leading recipient of foreign capital [Sassen 1991:39-40]. This reversal of capital flows in the present transition,

from an emergent centre to a declining centre, may be symptomatic of larger trends contrary to historical precedent. Thirdly, extensive warfare has been common during past hegemonic transitions in hastening the decline of the old and the emergence of the new. The 150 odd-years of warfare from the First Anglo-Dutch War (1652-54) to the Napoleonic Wars (1790s-1815) were crucial in weakening the Dutch and strengthening the British financially, the latter being relatively protected by its island status. Similarly, the two world wars were central in transforming Great Britain from a creditor to a debtor nation while doing the opposite for the US which enjoyed an analogous geostrategic insularity. The relative geopolitical weakness of Japan and Germany *vis-a-vis* the US today, on one hand, reduces the possibility of a system transforming war in the core, and on the other hand, gives an unprecedented advantage to the US government in extracting protection money from these clients so as to extend its 'belle epoque'. Further, a high degree of sophistication of technologies of warfare that ensures mutual destruction, in all probability, excludes the possibility of any extensive warfare in the core during the current hegemonic duel. In such a case aggression could be turned primarily towards the south, as shown in the Gulf War and continued UN belligerence towards Iraq, with complex ramifications for intra-core struggles between the US, Continental Europe and Japan. Nonetheless, in the 1980s and the 1990s we have witnessed the transformation of the US from the world's largest creditor to the world's largest debtor without the usual intermediation of a global war. Fourthly, all hegemonic states at the end of their hegemonic cycle have faced acute fiscal crisis due to one or a combination of factors that include declining production at home (hence taxes), geopolitical over-extension (hence expenditures), and costs of accommodation of social demands for redistribution. Through the 18th century tax revenues of the United Provinces failed to keep up with the interest on the public debt that put upward pressure on interest rates further worsening the situation until it reached about 10 per cent when the Dutch state simply went broke. Similarly, in the early 20th century the British state had to introduce 'income tax' to meet the demands on the state for basic social services, infrastructural development, and counter-cyclical measures. Eventually, even that was not good enough and the British state had to be bailed out by their richer transatlantic cousins. Today, the US is faced with a similar fiscal crisis but the sheer size of the debt and the budget deficit makes it a more intransingent problem. There is no way that the American state can either be allowed to go broke like the Dutch or be subsidised to the same extent that the British state could be after the second world war. Whoever emerges as the new leader and whatever institutional order is established it is going to be so much more difficult this time round because of the extraordinary troubles of the only real continental economy—the US—which is at the moment going through not only an exceptionally deep recession but also the end of a 40-year boom. The recession will of course end but the question is can a new phase of long-term expansion be brought about? Order in the financial sector helps but there can be no hope without growth in the real sector. Policy prescriptions for the latter are not at all clear since the exhaustion of the stimulatory medicine of Keynesian deficit spending. Keynesianism can no longer work because the strengthening of global markets *vis-a-vis* national state has reduced the power of states to effect countercyclical measures. Moreover, where state spending already takes over half of the national income it is so much difficult to intervene in comparison to when states absorbed only about 20 per cent of the national income in the 1930s. That is, there is already an overburdening of bureaucratic machinery and budgets [Strange 1986: 98]. In the financial sector itself, the predicaments facing the US appear to be unsolvable in a stagnant world-economy. It appears that the two deficits, the budget and the trade deficit, that pose the biggest threat to the international financial system are at the same time, to some extent, essential to maintain the present world order. The budget deficit needs to keep expanding for a while so as to keep the US financial system from collapsing as the current recession increases social spending including health care costs, and as the deepening S and L and banking crises absorbs more and more federal money. Referring to the troubles in the financial system in the 1980s none other than William Seidman, chairman of the Federal Deposit Insurance Corporation, issued the following warning in 1986:

> The financial area is probably, next to nuclear war, the kind of area that can get out of control, and once out of control cannot be contained and will probably do more to upset the civilised world than about anything you can think of [cited in *Financial Times*, May 29, 1986].

The political economy of the Reagan years has devastated state revenues. While creating a generalised anti-tax hysteria it has quadrupled the deficit not only because of military-keynesianism and the consequences of deregulation on S and Ls, etc, but also because of cuts in tax rates in such areas as capital gains, that fell from 39 per cent in the mid-1970s to 20 per cent in 1981, and the top individual income tax rate from 70 per cent in 1980 to 50 per cent in 1981 and then to 28 per cent by 1988. Consequently, though the top 1 per cent of the US households did increase their share of total income tax paid from 18 per cent to some 27 per cent, their proportionate share of family income rose even more from 8 per cent to between 13 and 14 per cent of the total [Phillips 1993]. That has fed the political and economic bifurcation of Wall Street and Main Street whose most visible short-term consequence has been Bill Clinton's storming of the Republican bastions of the suburbia. The trade deficit appears to be equally necessary for a while so as to keep the rest of the world, especially the Latin American countries, from defaulting on their loans by providing them access to the US market so that they can earn foreign exchange to service their debt [Sweezy and Magdoff 1988:54]. It appears to be an insoluble dilemma for the declining hegemon and an issue that has to be addressed so as to restabilise the international financial system under a new hegemonic regime.

Beyond the similarities and differences between transitions and the ensuing struggle for hegemony there are interesting secular trends to be noted about the evolving capitalist world economy as a whole. The 17th century monetary regime of the European world-economy was characterised, first, by a constant drainage of specie from Americas via Europe, to Asia and, second, by Amsterdam's quasi-monopolistic control over European liquidity. In the course of the 18th century, control over European liquidity was recentralised in London and the constant drainage of specie and other monetary instruments from west to east began to be reversed. The control exercised by London over international means of payments in the 19th century was probably tighter and more extensive than that exercised by Amsterdam in the 17th and 18th centuries. The drainage of means of payments from west to east was completely reversed as the financial expansion of the late-19th and early 20th centuries promoted a major transfer of liquidity in the form of loans and investments from Europe via London to the Americas. Consequently, the indebtedness incurred by European states, including and especially the UK, during the first and second world war *vis-a-vis* the US boosted this drainage to such an extent that, by the end of the second world war, control over world liquidity was almost completely centralised in the hands of US governmental and business institutions. Today, we have come around full circle and the drainage of monetary instruments is eastwards across the Pacific to east Asia.

This relocation of control over world liquidity was institutionalised at Bretton Woods. Under this regime, the fiction that world money is a commodity like any other, the supply of which can be left safely in private hands—as in different ways it had been under the Dutch and British regimes—was abandoned. Control over the

world supply of means of payments, including its distribution among political jurisdictions, was entrusted to select central banks that acted in concert under the leadership of the US government and its Federal Reserve System. The trend seems to be reversed today. For people only a little more than a decade ago, today's speed and scale of commodification of money is beyond imagination. As de-regulation has strengthened the market *vis-a-vis* states, it has basically postponed the day of confrontation between the 'self-regulating market' (in Polanyi's sense) and the political, legal and regulatory support that money needs from states. It is towards this confrontation that the international monetary order is headed.

The recent travails of the European Currency System and the inability of the European central banks to stem the speculative assault on the pound, the lira and now the franc makes evident how central banks, so powerful under the Bretton-Woods system, can no longer control the international system. It is said that the combined foreign exchange reserves of the most important central banks today amount to no more than a trillion dollars which is the value of the daily market transactions in international currencies, which is about 25 times the value of world trade! In New York alone, daily financial transactions amount to about one-fifth of the annual GNP of the US! The strength of the Eurodollar market which is beyond the reach of any particular state, the entry of new east Asian actors under Japanese leadership, and the increasing influence of non-banks like mutual funds and private actors over world liquidity has created fundamental problems of governance of the international financial system. It is an open question whether new regimes and institutions of governance would be put in place or the capitalist world-economy would continue to lurch from one crisis to the next, postponing any systemic overhaul. Much would depend on the possibility of the emergence of a new hegemonic power, in all probability centred in east Asia, or a hegemonic world government with new multilateral institutions of governance.

In that context, the question on everybody's mind is: could Japan be the new hegemon and establish order in the system.[54] Historically, all the three hegemons have been leading creditors to the world for much of the period of their financial dominance. They have also controlled the key public financial institutions of their age and their private financial institutions have dominated the international markets of their era. Moreover, their respective currencies—the Bank of Amsterdam's guilder, British sterling, and the US dollar—have acted as global currencies. With some limitations and differences the Japanese have begun to play many of these roles in the 1980s.

Most dramatically, since 1985, Japan has emerged as the world's largest creditor amassing external assets to the tune of US $ 328 billion by the end of 1990, which may have greater resonance because it has been paralleled by the fall of the US into a debtor position.[55] The majority of Japanese funds have been lent to the US firms and government, on which, unlike other emergent hegemons, Japan is economically and militarily heavily dependent. On account of this unprecedented situation some scholars like Susan Strange have claimed that the emergence of the US as the world's largest debtor may be a sign of its strength, especially because the Japanese state has exhibited very little influence over American policies [Strange 1990].[56] That may be changing. For instance, around mid-1987 there was a Japanese pull-out from American investments, that some have described as an officially sanctioned capital 'strike', so as to force the US government to correct its fiscal deficits and in November 1987 the Japanese minister of finance publicly called on the US government to raise taxes [Helleiner 1992:434]. Then, in April 1988, at the fourth annual meeting of the *US-Japan Working Group on Financial Markets*, Japanese officials demanded for the first time that the same amount of time be spent discussing Japanese concerns about American financial markets as was spent discussing American demands for further Japanese financial reforms.[57] In late 1989 the governor of the Bank of Japan, Yashushi Mieno, instituted a tight monetary policy after he reached the decision that the financial costs of supporting the US had become too great and he raised interest rates with intentions of bursting the American financial bubble in which equity and land prices had tripled since 1986 [Helleiner 1992: 436]. Japan's more active role in American affairs since the mid-80s is symbolised by the holding of the annual meeting of the Inter-American Development Bank in Japan in 1991. Such symbolic events, demands and actions have gone hand-in-hand with increasing Japanese influence at the institutional loci of the exant international financial regime. Increasingly acrimonious debates have broken out between the US and Japan over voting powers in multilateral financial institutions like the IMF, the IBRD and the Asian Development Bank with increasing concessions to Japanese financial clout. In a two-pronged strategy, in February 1991, the Bank of Japan organised and hosted a meeting of central bankers from Thailand, Malaysia, Indonesia, the Philippines, Australia, New Zealand, and South Korea (along with promises of annual meetings in the future), so as to institutionalise its regional financial pre-eminence along with greater international assertiveness. Displaying another hegemonic symptom, since 1986, Japan has become the largest bilateral aid donor for some 25 developing nations over whom the Japanese ministry of finance has enormous influence. So it must be concluded that Japan's financial presence is not only increasing *vis-a-vis* the US economy and state but is also being felt in multilateral and regional institutions, in tune with its ascendant trajectory.

Japan's private financial markets and institutions have acquired increasing weight in the international arena. By the late 1980s, Tokyo's bond, foreign exchange, and equities markets had all begun to challenge their New York counterparts in size.[58] By 1989, Tokyo's share of international banking activity had grown to be the largest of any financial centre. Japanese banks, for instance, had come to control 35 per cent of all international bank assets by 1988.[59] In banking, of particular importance is the Japanese Postal Savings System that controls almost one-third of the nation's savings making it the world's largest banker and giving the Japanese state the potential capacity of effecting the international financial system in a major way analogous to the effect of the Bank of England with British deposit-banking network behind it in the 19th century [Helleiner 1992:442].

In terms of the status of the yen as an international currency it is perhaps in the worst relative situation compared to the guilder, the sterling and the dollar in comparable phases of their respective hegemonic cycles. Low yields and insufficient liquidity of Japanese treasury bills have dissuaded investors from holding their assets in yen. Approximately 8 per cent of the world's official reserves were denominated in yen in 1989, in contrast to 19 per cent for the German mark and 60 per cent for the US dollar. Only 4.3 per cent of world trade was denominated in yen in 1989. Of course, things are changing for the better for the yen but the US continues to derive massive seigniorage benefits from issuing the world's most used currency and greatly benefits from being able to borrow from Japan in its own currency—a situation without precedent between the world's largest debtor and creditor [Helleiner 1992: 429].

Till the mid-1980s, Japan's power was used to support the American-centred global financial regime. Most importantly, Japan's enormous capital exports supported the external current account deficits and the internal fiscal imbalances of the US. Yet, the situation has some parallels with past transitions, especially in terms of continued Japanese dependence on the more highly developed financial markets of the US. British bankers and traders, for example, had already become key global actors in the 18th century when they continued to use Amsterdam markets and in 1763 came to the aid of latter. Similarly, the inadequacies of New York financial markets led American

merchants and financial operators to continue to be overly dependent on London well into the 1920s, by when they had already amassed more than 25 per cent of the world's gold reserves. The American state initially deferred to the Bank of England's greater expertise in rebuilding the international gold standard and even at the Bretton Woods conference, the British were still boasting that the Americans had "all the money bags, but we have all the brains" [cited from Helleiner 1992: 434]. Not at all dissimilar to American claims *vis-a-vis* the Japanese today!

Commensurate with its financial power Japan is becoming increasingly assertive, and given its greater dependence on imports and exports it may turn out, Helleiner argues, that the Japanese would be better at reinstituting an international financial regime. There are other reasons why the Japanese could do a better job. One is the freedom from diplomatic and military obligations of a superpower. That would be in line with the Dutch position in the 17th and 18th centuries. Similar to the Dutch, the Japanese would be less constrained to subordinate their role as financial leaders to geo-strategic objectives. Caught between France and England the Dutch maintained neutrality for a long time and attempted to divorce diplomatic considerations from the needs of international finance. At the present moment, for instance, the Japanese appear to have fewer qualms in dealing with the post-Tiananmen Chinese regime than American and European operators. Moreover, the Tokyo financial community has much greater say in the policies of the Japanese state than New York financiers ever had on the American state. That is analogous to the influence of the city on the British state and the Amsterdam plutocrats on the Dutch state. In addition, the rapid expansion of Japan's aid programme and her dependence on east Asian economies places her in a better position to address the financial mess between the north and the south, so crucial for any hegemonic regime today. As Dennis Yasutomo observed: "Japan's contribution to the solution of the north-south issue through aid giving is becoming a *raison d'etre* of Japan as a 21st century international state."[60] Then, in line with Japan's more interventionist and managerial tradition in economic institutions, the new Japanese international regime, if one does emerge, would be different from the "free market" ideological inhibitions of the past three hegemons. Within a decade or so the Japanese financial vision for the world would also have to come to terms with a vastly stronger European central bank and *ecu*, ushering in perhaps a more multipolar regime than ever before [Helleiner 1992:439-44].

For the first time in its long history there is a possibility today that the centre of accumulation would shift to the east, yet the west retains its monopoly of violence, so the question is will the west allow the inevitable to happen or will it be tempted to destroy capitalism so that it can continue to dominate the world? There is panic in the west and there is the typical apocalyptic pathos about the coming century with a hint of the end of the 'civilised world'. So let us give the last word to the *Times Literary Supplement* (that sentinel of western culture):

> Britain and Ireland could respectively be Japan's Hong Kong and Macao, well placed for the European entrepot trade, the United States will be Japan's fabulously wealthy India, terre des merveilles, while Australia can be Japan's Australia, land of rugged adventure and heavy drinking, the appropriate place of exile for Japanese dissidents and remittance men. This would leave only table scraps for the others: Holland, perhaps, for the Indonesians, France for the Vietnamese [how awful indeed!] (Sayle, April 28, 1989, *Times Literary Supplement*, cited in Cummings, nd).

Notes

[This paper is a slightly altered version of the one produced for the Fernand Braudel Centre under the guidance of Giovanni Arrighi, Terence Hopkins and Immanuel Wallerstein and funded by the MacArthur Foundation. I have benefited immensely from the comments of Iftikar Ahmad, Ken Barr, Shuji Hisaeda, Karen Ireland, Tom Riefer, Khaldoun Samman, Steve Sherman, Miawin Shih, Beverly Silver, and Eric Slater. This paper would not have been possible, without the work of P K Hui from which much of Section III is drawn, and the encouragement of Katherine Cesarini. It has greatly improved as a result of criticism from an anonymous referee for the *Economic and Political Weekly*.]

1 Which is not necessarily Eurocentric.

2 For a general discussion on financial centres and leadership by a particular centre see Kindleberger (1978: 66-134); Braudel (1984: 25-45; 89-276); Smith (1984: 985-1005). For a theoretically insightful and empirically rich description of "global cities" as financial centres in our contemporary world see Sassen (1991).

3 For further elaboration on this theme see Arrighi (1990).

4 For a general theory of financial crisis see Minsky (1977, 1982), Altman and Sametz (1977), Strange (1986), Kindleberger (1978), and Wolfson (1986).

5 See Kindleberger (1978).

6 For general descriptions of Amsterdam as the commercial entrepot see Barbour (1950 edn: 11-27, 35-41, 85-103), Israel (1990) and Braudel (1984: 175, 236-241).

7 For a succinct overall picture of world bullion flows between 1450-1800 and a discussion of the major sources of these calculations see Barrett (1990).

8 The *wisselbank's* stock of precious metals, amounted to 0.9 million guilders in 1610, about 11.8 million guilders in 1645 and about 10.6 million guilders in 1650, fluctuating between 7-8 million guilders during the years 1651-1686, and between 7-20 million guilders during the years 1687-1720. In the first half of the 18th century these stocks reached dramatically high levels, about 25 million guilders in 1721-24, 31 million in 1764, and about 26 million guilders in 1765. But entered a phase of rapid decline from 1783 (Attman 1983: 41).

9 For a discussion of the importance of the companies for later colonialism, that lies outside the scope of this paper, see Masselmann (1963).

10 This is a feature that would repeat itself on many trade routes and has been termed by Hicks as "the tendency to diminishing returns" (1969: 45, 56, and *passim*).

11 For the general crisis of the European world-economy that coincided with Dutch financial expansion, see Aston (1965), Hobsbawm (1965), Trevor-Roper (1965), Schoffer (1966), van Dillen (1974), Krantz and Hohenberg (1975), de Vries (1976), and TePaske and Klein (1981).

12 For a refinement of the traditional idea of a 'military revolution' in 16th century Europe, see Parker 1976. For the increasing size of European army, see Parker (1976: 205, Table 4) and for the size of navies, see Kennedy (1989: 99).

13 That was ensured through the elaboration of what McNeill calls the 'military-commercial complex'. See, McNeill 1984: 86-87, 90-91, 120-22, 126-31; Brewer 1989: 7-8.

14 Tracy (1985); Riley (1980); Plumb (1965).

15 For the character of the Dutch ruling elite, see Roorda (1964) and van Dijk and Roorda (1976).

16 Usually, as Braun suggests, "the more advanced states are, the more deeply they are in debt without being insolvent" (1975). Interestingly, Braudel provides a rough estimate of the historical limit between a healthy public debt and insolvency, at about twice the size of the GNP (1984: 307). That raises an interesting question about the limits of the American debt burden in our contemporary world-economy.

17 See Harper (1939).

18 For further elaboration on the tools of the English challenge to Dutch domination see Faber (1966); Astrom (1960); Davis (1969); Rankin (1969); Omrod (1975); Chaudhuri (1978); Wallerstein (1980; and Conquest (1985).

19 For elaboration see Curtin (1968); Lovejoy (1982); and Klein (1990).

20 For the long historical processes involved in the creation of the British national market, see Braudel (1984: 352-79).

21 See Dickson (1967); and Dickson and Sperling (1970).

22 Interestingly, Holland's debt-revenue ratio also peaked at 17 around 1720 (Riley 1980: 77).

23 There has been an extensive debate on the size and nature of the English national debt held by the Dutch in the 18th century. In 1737 a government spokesman, Sir John Barnard, opposing the motion to reduce the interest on the National Debt, quoted a figure of £ 10 million to represent the Dutch holding, arguing that if interest were reduced the Dutch would withdraw all their money with catastrophic consequences (Wilson 1941: 72). The consensus, for long, was that by 1776 the Dutch owned about three-sevenths of the British National Debt. Carter has shown that assessment to be an exaggeration, and she estimates that in reality it was somewhere between one-sixth and one-eighth. From about 1760-1783 the

proportion of solid Dutch money in the English funds remained between £ 25 million and £ 30 million. She has also challenged the thesis that there were many small Dutch share holders of British debt. She argues that it was usually held by those with inventories above 20,000 guilders (1975: 22, 25, 28-31, 40).

24 The importance of the Amsterdam capital market for British finances was not lost on contemporaries. Astier, the French consul at Amsterdam, reported with considerable chagrin, about big English loans in the Amsterdam market in 1760. Astier remarked, that in the given context, it was not difficult to understand why the British had of late been showing increasing respect for the Dutch flag. French, Dutch and English observers concurred on the importance of Dutch capital and speculated about its probable effects on the Anglo-French struggle. Luzac, a Frenchman, believed that Dutch neutrality (dominant between 1713-80) and Dutch capital had assisted England in its fight to dominate Europe and India. He argued that without Dutch capital, England could not have maintained such an immense navy, a land army in Europe and a great number of troops in the rest of the world and provided subsidies to sustain her influence [Wilson 1941: 70-71; also, see Sherwig 1969].

25 An observation by a Dutchman from Leyden cited in Braudel 1984: 269. For further details about the crisis of 1763 see, de Jong-Keesing (1939).

26 See Braudel 1984: 269; Kindleberger 1989: 136-37; Wilson 1941: 168; Carter 1975: 63.

27 In contrast Kindleberger argues that the locus of a crisis does not necessarily overlap with the hinge of the system (1978: 190-91).

28 See Keynes (1913); for the role of the empire in the British trade regime in general, see Cairncross (1953), Chaudhuri (1968), Crouzet (1975) and Cain (1985).

29 For further elaboration on the associated issue of demonetisation of gold in India so as to direct flow of gold to London and then India's absorption of huge quantities of surplus silver that stemmed world inflation see, de Cecco (1984: 62).

30 For further elaboration, see Sen (1992).

31 See Fisher (1969).

32 One rix-dollar was equal to 24.38 grams of pure silver. English merchants and ships ultimately acquired two-thirds of the gold that arrived in Portugal in exchange for cloth and corn. The Brazilian gold boom would last from 1695 to about 1770 (Phillips 1990).

33 Within the British system the Scots are reputed to have pioneered many of the 'modern' features [see Checkland 1975; Cameron 1982: 107; Kindleberger 1984: 83].

34 See Clapham (1966). The Bank controlled approximately 58 per cent of all banking assets in England and Wales in 1800, about 36 per cent in 1844 [Cameron et al 1967: 34, 42-45].

35 For a general description of the role of the city of London or the "mind of the city" see Checkland (1957). See the table compiled by Chapman concerning the number and amount of loans marketed by the Rothschilds and the Barings (1984: 16, Table 2.1).

36 The vortex of the crisis was London. London financed the boom in the securitisation of domestic companies, such as Guinness, but especially in Argentinian land based on exaggerated expectations of profit with the shift from grain to meat production and the development of refrigerator ships in 1875 [Kindleberger 1985:228-29]. During the crisis of 1890 British investors found themselves locked into Argentinian investments which could be sold only at very low prices if at all. However, these investors were able to realise cash in order to meet their commitments by selling US railroad bonds, which were absorbed by US investors not involved in the Argentinian investments [Michie 1987:241]. To tide over the immediate panic the British state, in addition to the domestic guarantee, arranged for the Russian government not to draw its £ 2.4 million deposit from Baring and a loan of £1.5 million from the State Bank of Russia and another loan of £ 3 million the Bank of France [Kindleberger 1978: 188].

37 In 1914 imports from the United States were 18 per cent of British imports; in 1918 they were 39 per cent of the total. By 1916 almost all British imports of munitions, iron and steel, oil, cotton and grain were coming from the US [Milward 1984:55, 64].

38 In 1914, British trade deficit was £170.4 million. In 1915 it was £367.9 million, in 1918, £783.9 million. The visible trade deficit with the United States in 1918 was £488.9 million [Milward 1984:55].

39 As a result of the war, "[e]xcept for British Dominions and Colonies upon whose borrowing the Colonial Stock Act of 1900 conferred preferential treatment or who continued to borrow in London for political as much as economic reasons, for much of the 1920s London and New York were in very real competition in the flotation of overseas loans [Eichengreen and Portes 1986: 602].

40 "... more than 55 per cent of total British investment in the period 1871-1913 was directed overseas. World War I occasioned a considerable liquidation of Britain's external assets, and in the second half of the 1920s the share of new capital issues for overseas borrowers declined from its pre-war range in excess of 50 per cent to 37-44 per cent before slumping to very much lower levels in the 1930s... In contrast to Britain, America's foreign assets doubled over the course of the war and, after fluctuating in the immediate post-war years, soared in the mid-twenties" [Eichengreen and Portes 1986: 601-03].

41 Also see Kindleberger (1988: 55, 73-82); Drummond (1987:40); Fearon (1979:36).

42 Kindleberger argues that it was the unwillingness of the US government to take up the leading role which caused the collapse of the world-economy in the early 1930s (1973:28). However, it is not at all clear whether the US economy had the financial strength at that point to underwrite the international financial system given the relatively limited use of dollar as an international currency and the continuing British expertise in international banking activities.

43 In fact, the US had always kept her tariffs high raising them from time to time between 1922 and 1930. The Fordney Act served notice that the war had not changed American attitudes about protection. Nonetheless, as a result of the Hawley-Smoot tariff, which increased the protection of the US considerably, countries all over the world immediately retaliated. The US was not interested in bringing down the increased trade barriers because its prosperity did not yet depend on free trade [Drummond 1987:36-37; Fishlow 1986:79; Fearon 1979:41].

44 In 1927-28 American capital outflows were of the same order of magnitude as the American current-account surplus. But these outflows then began to fall, so that in 1930 they barely financed half of that surplus. In 1929 the US injected $ 7,400 million into the world economy by its purchase of goods and services and its investments abroad, but by 1932 this figure had been reduced to $ 2,400 million [Fearon 1979:51]. In 1931 things became still worse; while continuing to run a current-account surplus the American economy pulled immense sums from the rest of the world, so that America's capital outflow became a capital inflow [Drummond 1987:39].

45 During 1946-58, 143 US subsidiary manufacturing firms were established per annum abroad, while during 1959-67, the number increased to almost four times to 566 per annum. By 1966, there were nearly 9,000 US subsidiaries in western Europe, over three times the number in 1957 [Glyn et al 1990:99].

46 The growth of the Euromarkets continued in the 1980s. In March 1988, the gross size of the market was estimated at $ 4,560 billion, which was much higher than $ 485 billion in 1975 [Hultman 1990:73].

47 Total US military expenditure in the Vietnam war has been estimated to be more than $ 140 billion [Miller 1986:56].

48 See Hultman (1990) and Itoh (1990).

49 See Strange (1986).

50 The factors that led to the stagnation of the world-economy, according to Itoh, were the failure to provide cheap and docile workers and maintain the cheap supply of primary products for the advanced capitalist countries from the third world (1990:53-54).

51 "Between a third and a half of OPEC's excess billions went to the Euromarkets, a total of $ 150 billion between 1974 and 1980" [Frieden 1987: 88].

52 It must be noted that the New York collapse was preceded by the fall in the London market (reacting to the failure of the Hatry on September 20, 1929) and the fall in the Berlin market (responding to tighter credit policies and flight of American capital to the NYSE).

53 Wilson (1963).

54 This sub-section is a mere paraphrasing of the work of Helleiner (1989, 1992). Special thanks are due to Thomas Reifer for drawing my attention to this literature.

Man, Political Man, Political Theory

Rustam Singh

A large, perhaps the largest, part of a subject's dialogical existence is spent in realms which remain totally beyond the available institutional arrangements. These realms, therefore, deserve as great a part of attention in political theory as the institutional arrangements are customarily given.

I

ONE of the central issues in political theory has remained the issue of political power, and the state has normally been treated as the point where this power resided. It was Marxist theory which, for the first time, decisively broke away from this tradition and shifted the focus of political analysis from the state to property or 'the means of production'. Whatever the implications of this theoretical shift in the residence of political power, its net effect, in the context of this essay, was the following: it merely transferred the focus of political examination from one institutional point to another.

At a different but connected level, a parallel and similar tendency is to be found in the treatment of man as a citizen or a purely political being—where 'political' includes the social and economic, as in non-Marxist theory, or, alternatively, as primarily an economic being, as in the dominant tradition in Marxist theory. One result of these tendencies has been to reduce the issue of political power to an issue which is of purely politico-economic and -social nature. Another result has been to reduce the human subject to a politico-economic and -social being.

Hidden in these reductions are the implications, first, that the political sphere is not just a part and a mere extension of man's existential world but is a separate sphere in its own right, and, second, that the human subject as a political being is, similarly, separate from his existential being and not just a part and a mere extension of it.

II

One assumption on which this essay is based is that the human subject enters the political arena in order to fulfil his existential needs, and the decision to stay on in or leave this arena is, again, an existential decision. Secondly, the entrance or staying on in this arena is not a matter of choice but is rather a compulsion. Not to assume a political persona and enter or stay on in the political arena is possible only at an existential cost. It is this compulsion to enter the political arena and wage a continuous battle for existence that makes this arena a necessary part and a mere extension of the human subject's existential world.

Implicit in these assumptions are a number of propositions. Briefly, these are: The proper subject for political analysis is the human subject. The human subject is an existential being in an existential setting. The political arena is a part of the existential setting, and political struggle is a part of the struggle for existence by existential human beings. As such, acquisition of political power is a central human motivation.

Below, we will clarify some of the terms used in the propositions outlined above. This clarification will in turn bring to light some of the premises that underly these propositions.

The term 'human subject', in our use, introduces two differentiations: one, man as different from all other entities; and, two, man as different from and incorporating the 'political man'.
